Odysseus. The hero of Homer's Odyssey, itself the model for James Joyce's *Ulysses*, Ulysses being the Roman name for him. The son of Laertes, king of Ithaca, and Anticleia, daughter of the wily thief Autolycus. However, one tradition makes him the son of Sisyphus (*q.v.*). He married Penelope (*q.v.*). Warned by an oracle not to go to Troy (*q.v.*) he feigned madness when the heralds arrived by sowing salt, but when Palamedes placed his son Telemachus (*q.v.*) before the plough he was forced to disclose his sanity and join the expedition. Later, at Troy, he avenged himself by having a letter signed in Priam's (*q.v.*) hand placed in Palamedes' tent. The letter was found and Palamedes was stoned to death. But Odysseus himself tricked Achilles (*q.v.*) into revealing his true identity and joining the expedition. At Troy Odysseus and Diomedes (*q.v.*) entered the city at night to kill Rhesus the Thracian and steal his white horses, because it was prophesied that if they drank of the Scamander (*q.v.*) Troy would not fall. He quarrelled with Ajax (*q.v.*) over the armour of Achilles and some say he killed him. He captured Helenus and from him learned the secret oracles which told how Troy would fall. In accordance with these he stole the Palladium of Athene (*q.v.*). It was also Odysseus who devised the stratagem of the Wooden Horse. When Troy fell he took Hecuba (*q.v.*) as a slave. His journey home lasted ten years and involved many adventures. He first went to Cicones to procure jars of sweet wine and then visited the Lotophagi (*q.v.*). After leaving them he landed in Sicily where he blinded Polyphemus the Cyclops (*q.v.*). Next he visited Aeolus (*q.v.*) and as a result was blown off course and lost all his ships save one at Telepylos. In this he reached Aeaea, land of Circe (*q.v.*) and on her advice sought the aid of Teiresias, a dead seer in the Underworld. In the land of the Cimmerians he summoned Teiresias' shade, and also those of his mother and former comrades, though Ajax (*q.v.*) held aloof. Then, with Circe's counsel he navigated the Scylla and Charybdis (*q.v.*) and neutralised the spell of the Sirens (*q.v.*) by blocking his crew's ears with wax but having himself tied to the mast that he might hear their song. At Thrinacia his men slaughtered the cattle of Helios (*q.v.*) and were punished by Zeus (*q.v.*), all but Odysseus dying in a subsequent shipwreck.

He drifted to Ogygia on flotsam, where he spent eight years with the nymph Calypso (*q.v.*). On a raft he made land at Scheria, was found by Nausicaa (*q.v.*) and given a ship to Ithaca (*q.v.*). Here he was recognised by Eumaeus (*q.v.*) despite his disguise as a beggar. He found Laertes in the country and Penelope (*q.v.*) besieged by suitors.

This drunken and unruly crew were headed by one Alcinous, their most persistent member. Penelope had kept them at bay by promising to marry one of them when she had finished weaving a robe for Laertes: a robe she unpicked each night. But betrayed by her servants she was now being forced to choose a husband.

Meanwhile Telemachus (*q.v.*) who had sailed away to find Odysseus returned to find him with Laertes and they plotted revenge. Still dressed as a beggar Odysseus entered the palace and was recognised only by his nurse Eurycleia and his faithful hound Argus which died on seeing his long lost master. Penelope now announced she would marry the suitor who could fire Odysseus' bow. Only he was able to bend and string it. The suitors having failed Odysseus strung the bow and with Telemachus slew the suitors.

The *Odyssey* ends when Athene (*q.v.*) reconciles the hero and the kinsmen of the suitors who were seeking revenge. Teiresias had prophesied that Odysseus had to go on another journey to appease Poseidon (*q.v.*) for the blinding of his son Polyphemus and would then live to an old age until death came from the sea.

One tradition tells how Telegonus, Odysseus' son by Circe came looking for his father, landed and began plundering for supplies. Odysseus and Telemachus gave battle and Telegonus killed Odysseus, not recognising his father. He also took Telemachus and Penelope to Aeaca where Circe married Telemachus and he himself married Penelope.

Odyssey. *See under* **Odysseus.**

Oedipus ("Swollen-foot"). The son of Laius, king of Thebes, and Jocasta (*q.v.*). The Delphic oracle said Laius would be killed by his son so he had the baby exposed on Mt. Cithaeron with a nail driven through its feet—hence "Oedipus". But he was found by a shepherd and raised by Polybus, king of Corinth, as his own son. As an adult Oedipus learned from the oracle that he would kill his own father and marry his own mother and believing himself the son of Polybus, left Corinth. He met Laius on the road and killed him in a quarrel. Laius had been on his way to Delphi to seek advice on ridding Thebes of the Sphinx (*q.v.*). This Oedipus did and was made king by the Thebans. He married Jocasta and they had four children, Eteocles (*q.v.*), Polynices (*q.v.*), Antigone (*q.v.*) and Ismene (*q.v.*). When Thebes suffered a plague because of their incest Oedipus contacted the seer Teiresias and learned whose son he was. When she heard the truth Jocasta hanged herself and Oedipus blinded himself with the pins from her dress. With Antigone and later Ismene he went into exile at the grove of the Eumenides (*see* **Erinnyes**) at Colonos in Attica. Here he was received by the gods, having first cursed the sons who had neglected him, saying they would divide their kingdom by the sword.

Oeneus. King of Pleuron and Calydon, husband of Althaea and father of Tydeus (*q.v.*), Meleager (*q.v.*), Gorge and Deineira (*q.v.*). His realm was seized by his nephews but his grandson Diomedes (*q.v.*) avenged him and put Andraemon, husband of Gorge, on the throne. He accompanied Diomedes to the Peleponnesus where he was killed by two nephews who had escaped Diomedes. Deineira (*q.v.*) married Heracles (*q.v.*).

Oenomaus. A son of Ares (*q.v.*), king of Elis. An oracle said he would be killed by his son-in-law. Therefore he challenged all his daughter's suitors to a chariot race and if they won they would marry his daughter Hippodameia: if they lost they were put to death. His own chariot was drawn by wind-born horses, a gift of Ares. He was murdered by Myrtilus at the instigation of Pelops (*q.v.*).

Oenone. A nymph who loved Paris (*q.v.*). He deserted her for Helen (*q.v.*) and when he was wounded by Philoctetes (*q.v.*) she refused to help him. Then, in remorse at his death, she committed suicide.

Oileus. One of the Argonauts (*q.v.*), father of Ajax.

Olympia. A small province in the western Peloponnesus, isolated from the centre and east of the Peloponnesus by high mountains. The site of a major sanctuary of Zeus (*q.v.*) whose worship replaced that of an early female divinity in the 9th century B.C. However, it was not till about 470 B.C. that a magnificent temple was built to Zeus. From 776 B.C. though, the Olympic games had been celebrated at Olympia in honour of Zeus. These quadrennial contests were international in character and an international truce accompanied their celebration. The prestige of the games was great and from 776 Greek chronology was based on the games, an "Olympiad" being a four-year cycle. Hence Olympiad 12, 1 denoted the 1st year in a four-year period after 11 previous Olympiads. If the number of Olympiads is multiplied by 4 and deducted from 776 we have our date *e.g.* 11 × 4 = 44, subtracted from 776 is 732 B.C.

Olympius. A term for any deity or muse inhabiting Olympus and not the Underworld.

Olympus, Mt. The highest peak in Greece on the borders of Thessaly and Macedonia. Its 2975 m are almost inaccessible and it was not climbed until 1913. It was believed to be the home of the twelve Olympian gods.

Omphale. Queen of Lydia and widow of Tmolus who purchased Heracles (*q.v.*) as a slave. He served her for three years and one tradition says he dressed as a woman and swapped clothes with Omphale during this period.

Ops. Roman goddess of plenty, a consort of Saturn (*q.v.*) and the personification of abundance.

Orcus. The Roman name for Hades (*q.v.*) and for his realm.

Orestes. The son of Clytemnestra (*q.v.*) and Agamemnon (*q.v.*). As a child he was smuggled out of Mycenae by his sister Electra (*q.v.*) when Clytemnestra and Aegisthus (*q.v.*) seized power. He took refuge at the court of king Strophius in Phocis, becoming a close friend of Pylades (*q.v.*), the king's son. When of age he, Pylades and Electra killed Aegisthus and Clytemnestra, and Orestes was punished for his matricide by the Erinnyes (*q.v.*). He fled to the Acropolis of Athens and embraced the image of the goddess. Athene (*q.v.*) then summoned the Areopagus to judge his case. Apollo (*q.v.*), whose oracle had encouraged his crime, defended him on the grounds that fatherhood was more important than motherhood. Athene's casting vote found him innocent. Another tradition says Apollo told him he could be free of the Erinnyes by fetching the statue of Artemis (*q.v.*) from the Tauric Chersonese. Orestes and Pylades went to Tauris and were seized by the natives for sacrifice to Artemis. But it transpired that his sister Iphigenia (*q.v.*) was the priestess and she helped them steal the statue and return to Greece. They met Electra and went on to Mycenae where Orestes killed Aegisthus' son and became king. Later he slew his rival Neoptolemus (*q.v.*) and married his cousin Hermione.

Oreithyia. *See* **Boreas.** He turned her into a wind.

Orion. A giant, son of Poseidon (*q.v.*) who was a renowned hunter and very handsome. He loved Merope, daughter of Oenopion of Chios and was promised her hand in return for ridding Chios of wild animals. This he did but Oenopion would not give up Merope which led Orion to seduce her. Oenopion, with the help of his father Dionysus, blinded Orion who was told by the oracle he could only recover his sight by going to the east and gazing on the sun as it rose. This he did with the help of Hephaestus (*q.v.*) and once there Eos (*q.v.*) fell in love with him and Helios (*q.v.*) restored his sight. Later he joined Artemis (*q.v.*) in a hunt. Apollo (*q.v.*) angry at his boasting that he would kill all the wild beasts and afraid he would seduce Artemis contrived his death at the unwitting hands of Artemis. She placed his image in the stars, his constellation rising with the sun at the autumnal equinox.

Orpheus. The son of king Oeagrus of Thrace and Calliope (*q.v.*). The Greeks regarded him as the first great poet. He could enchant the beasts and trees with his lyre, a gift from Apollo (*q.v.*). After returning from the voyage of the Argonauts (*q.v.*) he married Eurydice (*q.v.*). His grief at losing her after redeeming her from Hades (*q.v.*) led to a failure to honour Dionysus (*q.v.*) at a Bacchanalia and he was torn to pieces by Bacchae (*q.v.*). The muses buried the pieces at the foot of Mt. Olympus (*q.v.*) save his head which was thrown into the River Hebrus still singing. The head and his lyre eventually floated to Lesbos (*q.v.*) and were finally placed amongst the stars at the request of Apollo and the Muses. *See also* **Orphism, Section J.**

Orthrus. A giant two-headed dog, the offspring of Typhon (*q.v.*) and Echidne (*q.v.*) and, some say, the father of the Sphinx (*q.v.*) and Chimaera (*q.v.*). It was set to watch the oxen of Geryon (*q.v.*) and was slain by Heracles (*q.v.*).

Ortygia (1) Port of Syracuse in Sicily.

(2) Port of Delos (*q.v.*), birthplace of Artemis (*q.v.*).

Otus and **Ephialtes.** Twin sons of Iphimedeia and Poseidon (*q.v.*), named Aloeidae after their mother's later husband Aloeus. At an early age they imprisoned Ares (*q.v.*) and later swore to rape Hera (*q.v.*) and Artemis (*q.v.*). In a vain effort to achieve this they placed Mt. Pelion on top of Mt. Ossa and attacked Heaven. But Artemis induced them to seek her at Naxos. Here she leapt between them in the form of a doe and they accidentally slew each other. In Tartarus (*q.v.*) their shades were tied back to back by bonds of vipers.

Ovid. *See* **Section B.**

P

Palaemon. A sea god, the son of Athamas and Ino who was originally named Melicertes.

Palamedes. *See* **Odysseus.**

Pales. Italic deity of flocks and herds, worshipped on the Palatine.

Palicus. An obscure god or hero worshipped in Sicily and mentioned in the *Aeneid* (*q.v.*).

Palinurus. "Wind Astern", the helmsman of Aeneas. He managed the ship between the Scylla and Charybdis (*q.v.*) and in the storm off the coast of Carthage but later fell asleep and into the sea. He was cast ashore but murdered by local tribesmen. His shade begged Aeneas for carriage across the Styx (*q.v.*) so it could be at rest, but the Sybil refused as he had not been properly buried. However she promised him a shrine, Capo Pulinuro in Lucania near modern Salerno.

Palladium. A mythical statue of Athene given to Dardanus (*q.v.*) by Zeus (*q.v.*) to ensure the protection of Troy. By one tradition it was stolen by Odysseus (*q.v.*) and Diomedes (*q.v.*). By another Aeneas (*q.v.*) saved it and brought it to Rome where it saved the city several times in its early years.

Pallas. (1) A title of Athene (*q.v.*) given to her by the Achaens. Pallas, Kore and Parthenos signify a virgin, maiden or girl.

(2) One of the 24 Giants (*q.v.*) who rebelled against Zeus (*q.v.*).

(3) A brother of Aegeus (*q.v.*). *See also* **Theseus.**

(4) An ancestor of Evander (*q.v.*).

(5) Evander's son who went to follow Aeneas.

Pan. A god, half-man, half-goat, said by some to be a son of Zeus (*q.v.*) by others to be the son of Hermes (*q.v.*) and Penelope with whom he inhabited Arcadia. He was a patron of shepherds and herdsmen and a lover of mischief. When not frolicking with the nymphs he liked to startle peasants and flocks inspiring "panic". He loved and pursued Syrinx whose flight from him resulted in her being transformed into a reed from which he made a seven-piped flute, the syrinx. He also seduced Selene (*q.v.*). Sometimes identified with the Roman Faunus (*q.v.*).

Pandarus. A Trojan archer who broke a truce by shooting at the Greeks. In Chaucer's *Troilus and Criseyde* and Shakespeare's *Troilus and Cressida* he is Cressida's uncle and the lovers' go-between. The word "pandar" is derived from his name for this reason.

Pandora. "All gifts", the first woman fashioned and given life by Hephaestus (*q.v.*) and Athene (*q.v.*). Zeus (*q.v.*) sent her to punish man after Prometheus (*q.v.*) had given him fire. She married the brother of Prometheus, Epimetheus. Her curiosity led her to open a box which it was forbidden to touch, and from it sprang all the evils and diseases which beset mankind. Only hope was left at the bottom of the box.

Parcae. The Roman equivalent of the "Fates" or Horae.

Paris. Son of Priam (*q.v.*) and Hecuba (*q.v.*) who dreamed during her pregnancy that she would bring forth a blazing firebrand. As a child he was exposed on Mt. Ida. Raised by shepherds he was named Paris or sometimes Alexander ("defender of men") because of his courage. He loved and deserted Oenone (*q.v.*) which eventually caused his death. Promised the fairest of women by Aphrodite (*q.v.*) if he gave her the apple of discord, he did as she bade. Reunited with his parents he then left for Sparta whence he seduced Helen (*q.v.*) thus starting the Trojan War. At one point in the war Aphrodite saved him from death in a duel with Menelaus.

He shot the arrow which slew Achilles (*q.v.*) at the Scaean Gate but was himself mortally wounded by Philoctetes (*q.v.*).

Parnassus, Mt. 2461 m peak in the Pindus range, north-east of Delphi (*q.v.*). Home of Apollo (*q.v.*) and the Muses (*q.v.*) hence the name "Montparnasse" for the hill in Paris on which centred the university and cultural life of that city. On the original's slopes was also the Corycian Cave, a centre of the Bacchae (*q.v.*).

Parthenon. *See* **Section L.**

Parthenope. A nymph whose body was said to have washed up at Neapolis (Naples) around 600 B.C. She gave her name to the short-lived Parthenopean Republic of Naples established by Napoleon in 1799.

Parthenopeus. *See* **Seven Against Thebes.**

Parthenos. *See* **Pallas.**

Pasiphaë. Daughter of Helios (*q.v.*) and Persë, and wife of Minos (*q.v.*). Mother of the Minotaur (*q.v.*) by the Cretan Bull (*q.v.*) and of many children, including Ariadne (*q.v.*), Glaucus and Phaedra, by Minos.

Patroclus. Cousin and bosom companion of Achilles (*q.v.*) whom he met at the court of Peleus (*q.v.*) while in exile for an accidental murder. Slain by Hector (*q.v.*) while wearing Achilles' armour, his death persuaded Achilles to re-enter the Trojan War.

Pausanias. Spartan king who intervened to moderate Lysander's arrogant attitude towards Athens and other Greek cities after the Peloponnesian War.

Pegasus. Winged horse, offspring of Poseidon (*q.v.*) and Medusa (*q.v.*). It was captured by Bellerophon (*q.v.*) at the fountain of Pirene and helped him slay the Chimaera (*q.v.*). It struck Mt. Helicon with its hoof and brought forth the spring of Hippocrene, sacred to the Muses.

Peleus. The son of Aeacus, king of Aegina. With his brother Telamon he killed their half-brother Phocus and the two were expelled to Phthia in Thessaly by Aeacus. Here Eurytion purified them of murder. They took part in the Calydonian Hunt when they accidentally killed Eurytion. They then fled to the court of Acastus (*q.v.*) of Iolcis. Zeus (*q.v.*) married him to Thetis (*q.v.*) though he himself loved Thetis. This was because the oracle foretold that her son would be greater than his father.

Their son was Achilles (*q.v.*). All the gods save Eris (*q.v.*) were invited to the wedding and in revenge she cast the Apple of Discord. Peleus later ruled the Myrmidones at Phthia.

Pelias. *See* **Jason.**

Pelicles. Son of Peleus *i.e.* Achilles (*q.v.*).

Peloponnesus. The "island of Pelops" (*q.v.*), the large southern peninsular of mainland Greece, attached to northern Greece by the Corinthian isthmus.

Pelops. Son of Tantalus (*q.v.*) king of Lydia. Tantalus cut him in pieces and served him to the gods at a meal. Only Demeter (*q.v.*) grieving for Persephone (*q.v.*) did not realise and she ate Pelops' shoulder. Zeus (*q.v.*) restored him to life by having Hermes (*q.v.*) boil him in a pot. Demeter gave him an ivory shoulder, said to be the birthmark of his descendants. His shoulder blade was later taken to Troy (*q.v.*) by the Greeks as the oracle said this was necessary if the city were to fall. He married Hippodamia.

Pelorus. One of the Sparti (*q.v.*).

Penates. Roman deities of the home, confused from early times with the *genius* and the Lares. Eventually a wide variety of deities, *e.g.* Mars, Mercury, Venus, were regarded as *"di Penates"* that is, "guardians of the hearth".

Penelope. The wife of Odysseus (*q.v.*), usually seen as a symbol of fidelity. One tradition in the Peleponnesus made her adulterous and the mother of Pan (*q.v.*) by Hermes (*q.v.*) or by all of her many suitors.

Peneus. The son of Oceanus (*q.v.*) and Tethys. A river god and father of Daphne (*q.v.*) and Cyrene (*q.v.*). Identified with the River Peneus in Thessaly.

Penthesilea. Daughter of Otrere and Ares (*q.v.*), queen of the Amazons (*q.v.*) who helped the Trojans. Slain by Achilles (*q.v.*) they fell in love as she died and he later mourned her. When the wretched Thersites mocked his grief Achilles slew him which caused his kinsman Diomedes (*q.v.*) to throw her corpse into the Scamander. It was retrieved and honourably buried.

Pentheus. Grandson of Cadmus (*q.v.*) and king of Thebes. The subject of Euripedes' *Bacchae*. He refused to allow Dionysus (*q.v.*) into the city but the god, in disguise, persuaded him to dress as one of the Bacchae (*q.v.*) and watch their orgies. He was then torn to pieces by the Bacchae, led by his own mother who was in a trance.

Perdix (or **Talos**). *See* **Daedalus.**

Periclymenus. The son of Neleus (*q.v.*) and brother of Nestor (*q.v.*). An Argonaut (*q.v.*) he could assume any form he chose. Slain by Heracles (*q.v.*).

Periphetes. A giant residing at Epidaurus who murdered travellers with an iron club. Slain by Theseus (*q.v.*) who henceforth carried his club.

Perse. The daughter of Oceanus (*q.v.*). Wife of Helios (*q.v.*) to whom she bore Circe (*q.v.*), Pasiphaë (*q.v.*), Aeetes and Perses (*q.v.*).

Persephone. Daughter of Zeus (*q.v.*) and Demeter (*q.v.*). She spent the winter months with Hades (*q.v.*) when nothing grew and with Demeter she spent the fertile months. Thus she was a goddess of vegetation. She was also queen of the Underworld and was a symbol of death. Known to the Romans as Proserpina. Her companion in the Underworld was Hecate (*q.v.*).

Perses. The son of Helios (*q.v.*) and Perse (*q.v.*) father of Hecate (*q.v.*).

Perseus. Grandson of Acrisius (*q.v.*) king of Argos and the son of Zeus (*q.v.*) and Danae (*q.v.*). Raised at the court of Polydectes who sent him to fetch the head of Medusa (*q.v.*). Hermes (*q.v.*) gave him a sickle with which to do this and told him how, via the Graeae (*q.v.*) he could procure Hades' (*q.v.*) helmet of invisibility, winged sandals and a magic wallet to help him in the task. Once he had the head he petrified the Titan Atlas (*q.v.*) with it. He then flew to Aethiopia where he found Andromeda (*see* **Cassiopeia**). Returning to Seriphos he slew Polydectes, made Dictys (*q.v.*) king and returned to Argos. He went on later to exchange the kingdom of Argos for that of his cousin Megaperthes of Tiryns.

Phaebus ("Shining"). A name used for Apollo (*q.v.*) at Delos (*q.v.*) where he was associated with Artemis (*q.v.*).

Phaedra. The daughter of Minos (*q.v.*) and wife of Theseus (*q.v.*) to whom she bore Acamas and Demephon. *See also* **Hippolytus.**

Phaeton. The son of Helios (*q.v.*) and Clymene. Helios let him drive the chariot of the sun across the sky but he lost control of it and was killed by a thunderbolt from Zeus (*q.v.*) for almost setting the world on fire. He fell into the River Po and his sisters who mourned him were turned into poplar or alder trees and their tears into amber.

Phalanthus. Mythical founder of Tarentum in Italy.

Philemon. The husband of Baucis. This old Phrygian couple once received Zeus (*q.v.*) and Hermes (*q.v.*) with great hospitality.

Philoctetes. The son of Poecas, nephew of Protesilaus, and companion of Heracles (*q.v.*). He lit Heracles funeral pyre and received his bow and arrows. On the way to Troy (*q.v.*) one of the poisoned arrows wounded him, or he was bitten by a snake on the island of Tenedos. The smell of the wound became so offensive that on the advice of Odysseus (*q.v.*) he was left on Lemnos. Later an oracle revealed that Troy would not fall till the bow and arrows of Heracles were brought to the Greeks and Odysseus and Diomedes (*q.v.*) fetched him to Troy. Here either Machaon or Podalirius, the sons of Asclepius (*q.v.*) cured him of his wound. He slew Paris (*q.v.*) and later settled in Italy.

Philomela. *See* **Procne.**

Phineus. King of Salmydessus in Thrace and the son of Agenor. He first married Cleopatra, then Idaca who falsely accused her stepsons of improper advances. Phineus imprisoned them and was made blind and pursued by the Harpies (*q.v.*). Eventually the Argonauts (*q.v.*) whose ranks included Zetes and Calais, Cleopatra's brothers, slew the Harpies. Phineus freed the stepsons and told Jason (*q.v.*) what course to set.

Phlegethon ("Blazing"). A river of the Underworld called the "river of flames" by Plato. The shades of those who had committed crimes of violence against their kin were roasted in it until they received forgiveness.

Phlegyas. A king of the Lapithae (*q.v.*) who burnt Apollo's (*q.v.*) shrine at Delphi and was punished for it in the Underworld by having to sit beneath a huge rock which was liable to fall at any time.

Phocis. Small mountainous province of northern Greece which held the oracle of Delphi.

Phocus. *See* **Peleus.**

Phoebe ("Bright"). In early myth the daughter of Heaven and Earth and mother of Leto (*q.v.*). Later identified with Artemis (*q.v.*) the moon-goddess.

Phoenix ("Red"). (1) Companion and tutor of Achilles (*q.v.*) who tried to reconcile him with Agamemnon (*q.v.*).

(2) The brother of Cadmus (*q.v.*) and Europa (*q.v.*), eponymous ancestor of the Phoenicians.

(3) A mythological bird which died on a funeral pyre every 500 years before rising again from the ashes.

Phorcys. A sea-god, the father of Echidne (*q.v.*), Ladon, the Gorgons (*q.v.*) and the Graeae (*q.v.*).

Phrixus and **Helle.** Brother and sister, the children of Athamas king of Aeolia. Their stepmother, Ino (*q.v.*), had engineered their sacrifice by Athamas out of jealousy but they escaped on a flying ram with a golden fleece sent by Zeus (*q.v.*). Helle fell off into what was henceforth the Hellespont, but Phrixus reached Colchis and sacrificed the ram to Zeus (*see* **Jason**). The ram's image was placed amongst the stars as Aries.

Phyllis. *See* **Demophon.**

Picus. An ancient Italian god represented as a woodpecker *i.e. "picus'*.

Pierides. A name applied to the Muses (*q.v.*). It was derived from the inhabitants of Pieria, on the south coast of Macedonia, who were noted for their worship of the Muses.

Also a name for nine daughters of Pierus king of Macedonia who were defeated in a contest by the Muses and turned into birds.

Pillars of Hercules. Two pillars, Calpe and Abyla, erected on either side of the straits of Gibraltar by Heracles (*q.v.*).

Pilumnus. An ancient minor Italian god, "the spearman".

Pindar. *See* **Section B.**

Pirithous. Son of Ixion (*q.v.*) and Dia, companion of Theseus (*q.v.*) and king of the Lapithae (*q.v.*). He led the fight on the Centaurs (*q.v.*). On the death of his wife Hippodamia he and Theseus abducted the young Helen (*q.v.*) of Troy. She fell by lot to Theseus who, in return and despite misgivings, promised to help Pirithous abduct a daughter of Zeus (*q.v.*) for himself. They attempted to abduct Persephone (*q.v.*) from the Underworld but Hades (*q.v.*) chained them to a rock. Heracles (*q.v.*) later freed Theseus but Pirithous was left to suffer torment for his sins.

Pleiades. The seven daughters of Atlas (*q.v.*) and Pleione and companions of Artemis (*q.v.*). Zeus (*q.v.*) turned them into doves and placed their image in the stars to save them from the attentions of Orion (*q.v.*) who pursued them for five years. A group of seven poets in 3rd century B.C. Alexandria also called themselves the Pleiad.

Plutarch. *See* **Section B.**

Pluto. (1) A Roman name for Hades (*q.v.*), "the rich one" who owns the riches of the earth itself.

(2) A nymph who was mother of Tantalus (*q.v.*) by Zeus (*q.v.*).

Podarces. (1) *See* **Priam.**

(2) Son of Iphiclus, leader of the Thessalians who fought at Troy (*q.v.*).

Polites. A son of Priam (*q.v.*) and Hecabe (*q.v.*), slain before their eyes by Neoptolemus (*q.v.*).

Pollux. The Roman name for Polydeuces. *See* **Castor.**

Polydeuces. *See* **Castor.**

Polydorus. (1) The son of Cadmus (*q.v.*) and Harmonia and ancestor of Oedipus (*q.v.*) and other great Theban kings.

(2) The youngest son of Priam (*q.v.*) and Hecabe (*q.v.*).

Polymnia. *See* **Muses.**

Polynices. The son of Jocasta and Oedipus (*q.v.*), brother of Eteocles (*q.v.*), Antigone (*q.v.*) and Ismene (*q.v.*). *See also* **Seven Against Thebes.** When Creon refused to allow his burial Antigone (*q.v.*) disregarded the order and buried the corpse.

Polypemon. Also known as Procrustes, "the stretcher'. A robber who tied travellers to a bed and if they were too tall he cut off their legs; if too short he put them on a rack. Theseus (*q.v.*) did the same to him.

Polyphemus. *See* **Cyclopes and Galatea.**

Polyxena. The daughter of Priam (*q.v.*) and Hecuba (*q.v.*) beloved by Achilles (*q.v.*) whose shade requested her sacrifice by Neoptolemus (*q.v.*) after Troy's (*q.v.*) fall. This is the theme of Euripedes' *Hecabe*.

Pomona. An Italian goddess of tree-fruits (*poma*) *e.g.* apples. She was a minor deity but had her own priest and sanctuary near Rome. Ovid links her with Vertumnus, an Etruscan god with the power to change his shape. He was god of the changing seasons and the ripening fruits of autumn, and also of money changing. *Vertere* means "change" in Latin. He loved Pomona and pursued her disguised as a harvester, vine-dresser, herdsman and old woman, but only won her when he appeared as himself. His statue stood in the Vicus Tuscus, a busy street of brothels and shops named after him as an Etruscan.

Pontus. The sea, offspring of Ge (*q.v.*) the earth.

Pontus Euxinus. The "Hospitable Sea", the Greek name for the Black Sea. The name was an attempt to flatter and placate a hostile sea which was much feared by sailors.

Porphyrion. *See* **Giants.**

Porsenna. *See* **Lars Porsenna.**

Portunus. A Roman sea-deity associated with harbours.

Poseidon. The Roman Neptune, the god of earthquakes, and later of the sea. The eldest son of Cronus (*q.v.*) and Rhea. When he and Zeus (*q.v.*) and Hades (*q.v.*) cast lots for their realms he won the sea and had an underwater palace near Aegae in Euboea. Here he kept horses with brazen hoofs and gold manes who drew his chariot across the sea. Its passage calmed the sea. Poseidon created the horse and invented the bridle. As a horse he raped Demeter (*q.v.*) who was disguised as a mare. Their offspring was the horse Arion and the nymph Despoena and, some say, Persephone (*q.v.*). He resented Zeus (*q.v.*) and helped Hera (*q.v.*) and Apollo (*q.v.*) enchain him. In punishment Zeus made him a servant of Laomedon (*q.v.*) and he built the Neptunilia Pergama, the walls of Troy. He helped the Greeks at Troy but hated Odysseus (*q.v.*) who blinded Polyphemus (*q.v.*). He disputed the possession of Athens with Athene (*q.v.*) and lost, but Zeus gave him the Isthmus of Corinth instead. Here the Isthmian games were held in his honour. He married Amphitrite (*q.v.*). By mortal women he had many children including Pegasus (*q.v.*) and the Aloeidae (*q.v.*).

He is usually portrayed with a trident which he used to shake the earth.

Priam. The son of Laomedon (*q.v.*) and husband of Hecuba (*q.v.*). Originally called Podarces his name was changed to Priam *i.e.* "ransomed" because Heracles (*q.v.*) spared him and sold him to Hesione (*q.v.*) his sister. He had fifty sons and fifty daughters, nineteen of whom were by Hecuba and included Hector (*q.v.*), Paris (*q.v.*), Helenus (*q.v.*) and Cassandra (*q.v.*). He begged Achilles (*q.v.*) to return Hector's body. Eventually slain at the altar of Zeus (*q.v.*) by Neoptolemus (*q.v.*).

Priapus. The son of Dionysus (*q.v.*) and Aphrodite (*q.v.*). A fertility god whose worship spread from the Hellespont to Greece and later Rome, though he was never taken seriously. He was often portrayed in the form of a red-faced scarecrow with a large detachable phallus and in this role was used to scare birds. The phallus became a truncheon to ward off other intruders. He was also a protector of cultivated gardens and a god of sailors. In Petronius' *Satyricon* he pursues the hero Encolpius and makes him impotent. Horace and Martial write of him lightheartedly and 85 obscene poems about him – *"priapeia'* – exist of unknown authorship. His sacrificial animal was the donkey, a symbol of lust.

Procne. The daughter of Pandion, king of Athens. Pandion gave her to Tereus in return for his assistance and they had a son Itys. But Tereus wanted her sister Philomela. He made Procne a slave and tore out her tongue, then seduced Philomela saying Procne was dead. Procne could only alert her sister and be free by stitching a message to her robe. Once free she slew Itys, cooked pieces of the corpse and fed it to Tereus. When Tereus learnt what had happened he chased the sisters with an axe but the gods turned him into a hawk, Procne into a swallow and Philomela a nightingale though some traditions say it was Philomela who lost her tongue and became a swallow.

Procris. Daughter of Erectheus of Athens and the wife of Cephalus. Eos (*q.v.*) who also loved Cephalus showed him that Procris was easily seduced in return for gold. Procris then fled to Crete and lived for a time with Minos (*q.v.*). On returning to Athens disguised as a youth she brought with her a hound and spear, gifts from Artemis (*q.v.*), which never missed their quarry. Cephalus so wanted the gifts that the couple were reconciled. But Procris suspected Cephalus of having an affair with Eos and followed him on a hunt where he accidentally killed her with the spear.

Procrustes. *See* **Polypemon.**

Proetus. The son of Abas (*q.v.*) king of Argolis. His twin brother Acrisius (*q.v.*) expelled him and he fled to Lydia where he married Anteia (also called Stheneboea) daughter of king Iobates (*see* **Bellerophon**). He later returned to Argolis and forced Acrisius to give him half the kingdom. He ruled from Tiryns whose huge walls he built with the aid of the Cyclopes (*q.v.*). Eventually gave two thirds of his kingdom to Melampus (*q.v.*) and Bias.

Prometheus. A Titan (*q.v.*) and the brother of Epimetheus (*q.v.*) or "afterthought" and Atlas (*q.v.*). Sometimes said to be the maker of mankind. He supported Zeus (*q.v.*) against his brother Titans but stole fire from Olympus and gave it to men. This angered Zeus who took revenge on man through Pandora (*q.v.*) and punished Prometheus by chaining him to a rock in the Caucasus. Here an eagle tore at his liver each day. The liver was renewed daily and Prometheus suffered this torment until Heracles (*q.v.*) rescued him.

Proserpina. Roman counterpart of Persephone (*q.v.*).

Proteus. A sea god and a subject of Poseidon (*q.v.*). He had the power of prophecy and could change his form. He would avoid prophecy by changing form until tightly gripped; then he appeared in his true shape and spoke the truth. Said to live on the isle of Pharos in the Nile Delta. Menelaus (*q.v.*) mastered him while returning from Troy (*q.v.*) and forced him to reveal the way to Sparta.

Psyche. In Greek literature, the "soul" personified, often portrayed as a butterfly. As the centre of emotion she was tormented by *"eros"*. Her beauty made Aphrodite (*q.v.*) jealous and she sent Eros (*q.v.*) to torment her. Instead he fell in love with her though he would not let her see him or disclose his identity. But at the bidding of her two sisters she sought to discover who he was. For the first time she saw him, holding a candle above him as he slept, but hot wax fell on him. He woke and left her to seek him. After many trials she found him, became immortal and was united with Eros for ever.

Pygmalion. (1) The king of Tyre and brother of Dido (*q.v.*).

(2) The king of Cyprus who made and fell in love with a maiden's statue. Aphrodite (*q.v.*) answered his prayers and gave the statue life as the girl Galatea. They married and had two sons, Paphus and Metharme. In some versions of the tale he is a sculptor. The basis of Shaw's *Pygmalion* and the musical *My Fair Lady*.

Pylades. Husband of Electra (*q.v.*). *See also* **Orestes.**

Pyramus and **Thisbe.** The lovers in a tale by Ovid which he heard in the East. Living in Babylon they are forbidden to meet but converse through a chink in a wall. They arrange a meeting at the tomb of Ninus but Thisbe, arriving first, was chased away by a lion and dropped her veil. Finding this, Pyramus thought her dead and committed suicide. She returned and slew herself on his sword. Since that time the nearby mulberry has borne fruit the colour of blood. This is the basis of Bottom's tale in Shakespeare's *A Midsummer Night's Dream*.

Pyrrhus. Another name for Neoptolemus.

Pythia. The priestess of Apollo (*q.v.*) at Delphi (*q.v.*).

Python. A she-dragon of Mt. Parnassus who controlled the oracle at Delphi (*q.v.*). The boy Apollo (*q.v.*) slew her and the Pythia (*q.v.*) took over her task of giving voice to oracles.

Q

Quirinus. A very ancient Roman deity whose cult was centred on the Quirinal. The Romans eventually forgot his original character and he was identified with Mars (*q.v.*) in classical times, though Romulus (*q.v.*) was also supposed to have adopted the name after his deification.

R

Rape of the Sabine Women. An episode recounted by Livy and Ovid to explain the intermarriage of the Roman settlers and natives. Romulus (*q.v.*) and his followers invited the surrounding tribes to celebrate a festival in the Circus Maximus then carried off the native girls. War broke out but the Sabine women, who had been well treated, intervened to restore peace.

The event has been the subject of paintings by Poussin and Rubens and of a group of statues by Giovanni da Bologna.

Remus. *See* **Romulus.**

Rhadamanthus. The son of Zeus (*q.v.*) and Europa (*q.v.*), brother of Minos (*q.v.*) and Sarpedon (*q.v.*). Once the ruler of part of Crete but Minos forced him to flee to Boeotia (*q.v.*). Famed for his wisdom and justice he was made one of the judges of the Underworld after his death. He married Alcmene (*q.v.*) on the death of Amphitrion (*q.v.*).

Rhea. (1) A Titaness, daughter of Ge (*q.v.*) and Uranus (*q.v.*). *See* **Cronus.**

(2) *See* **Romulus.**

Rhesus. A Thracian king who helped the Trojans. An oracle said that if his magnificent snow-white horses ate the grass of the Trojan plain and drank of the River Scamander Troy would not fall. Diomedes (*q.v.*) and Odysseus (*q.v.*) raided his camp, slew him, and stole the horses.

Rhodos/Rhode. The daughter of Poseidon (*q.v.*), wife of Helios (*q.v.*).

Rome. The "eternal city" sited on the banks of the Tiber. Traditionally founded in 753 B.C. (year 1 of the Roman calendar) by Romulus (*q.v.*). It only really became a city in the 6th century under the Tarquins. Under the Republic it had a population of two or three hundred thousand, of 450,000 by the time of Augustus and 1,000,000 under the Antonines, though the population was occasionally reduced by wars, fires and plagues.

Romulus. The legendary founder of Rome (*q.v.*), twin brother of Remus and together the sons of Rhea or Rhea Silvia. She was the daughter of Numitor, king of Alba Longa (*q.v.*) who was deposed by his brother. Her uncle compelled her to become a Vestal Virgin (*q.v.*) but she bore Romulus and Remus, according to her, by Mars (*q.v.*). Her uncle then imprisoned her and threw the babies into the Tiber. The shepherd Faustulus (*q.v.*) found a wolf suckling them and reared them. When they reached manhood they returned to Alba Longa, restored Numitor to the throne and set off to found a city of their own. They went to the site of Rome and decided to consult the gods. Romulus chose the Palatine Hill, his childhood home, as the centre of the city, Remus the Aventine (*q.v.*). The gods favoured Romulus, sending him an extraordinary omen of twelve vultures, Remus only six. Thus Romulus was given the honour of founding Rome which he did by ploughing a furrow around the Palatine. As he commenced building the city wall Remus derisively jumped over it, a quarrel ensued and Romulus slew him. Romulus took in fugitives in order to populate the city, found them wives by the "Rape of the Sabine women" (*q.v.*) and reigned for forty years before disappearing in a whirlwind on the Campus Martius.

He was deified and identified with the Sabine god Quirinus (*q.v.*).

Rubicon. *See* **Section L.**

S

Sabines. A branch of the Samnite race and one of the Sabellian peoples who occupied the Etruscanised area on the middle valley of the Tiber around Falerii. To the south of Rome they held the mountainous land between Rome and Campania. They were a constant threat to early Rome and the tradition that one Titus Tatius, a Sabine prince, was offered joint rule by Romulus (*q.v.*) may indicate a period of Sabine occupation or domination of Rome.

Sabinus. A mythical Sabine king.

Salmoneus. The son of Aeolus (*q.v.*) and brother of Sisyphus (*q.v.*). The founder of Salmone. His pride led him to emulate the thunder and lightning of Zeus (*q.v.*) who slew him and crushed his city with a thunderbolt.

Sarpedon. The son of Zeus (*q.v.*) and Europa (*q.v.*), brother of Minos (*q.v.*) and Rhadamanthus (*q.v.*). The three brothers quarrelled over the love of the youth Miletus (*q.v.*). Sarpedon went to Asia Minor and became king of the Lycians after helping king Cilix of Cilicia defeat them. Zeus allowed him to live three generations and he helped Troy (*q.v.*) in the Trojan war. Patroclus (*q.v.*) slew him.

Saturn. From *Satus i.e.* "sown". Ancient Mediterranean god of agriculture, possibly of Ligurian origin and particularly revered in Sardinia (*q.v.*) and Africa (*q.v.*). Later identified with Cronus (*q.v.*) who supposedly emigrated to Italy after being deposed by Zeus (*q.v.*). Here he presided over a mythical "Golden Age". His temple in Rome was consecrated in 497 B.C. and housed the state treasury. His festival, the Saturnalia, was celebrated near the winter solstice, originally on 17 December but from the 4th century A.D. on New Year's Day. During the celebrations complete licence was given, slaves took the place of their masters, presents were given, a "Lord of Misrule" appointed and merrymaking and disorder of every kind was rife. It may be that in primitive times his worship involved the sacrifice of humans because in classical times rush dummies in human shape (*argei*) were flung into the Tiber each year on 15 May in his honour.

Satyrs. Young spirits of wildlife, the woods and hillsides. Sons of Hermes (*q.v.*) closely associated with Dionysus (*q.v.*). They were possessed by lechery and a love of wine and embodied the fertile force of nature. Usually they were personified with pointed ears, horns and a tail like Pan's (*q.v.*).

Scaean Gate. The "left hand", the gate in the walls of Troy (*q.v.*) where Achilles (*q.v.*) fell.

Scamander, River. River in Asia Minor near Troy (*q.v.*), originally called the Xanthus. Its name was changed when the mythical Scamander (*q.v.*) of Crete founded a colony in Phrygia and jumped into the river.

Scamander. One-time king of Crete, father of Teucer (*q.v.*) by the nymph Idaea and therefore an ancestor of the Trojans.

Sciron. A robber who dwelt on the border of Attica and Megara. He preyed on travellers and forced them to wash his feet on the Scironian rock. He then kicked them off the rock into the sea to be eaten by a giant turtle. Theseus (*q.v.*) slew him.

Scylla. (1) *See* **Minos.**

(2) *See* **Charybdis.**

Scyrus. Aegean isle, half-way between Lesbos and Euboea and off the major trade routes. It was of no importance save in legend: here Achilles (*q.v.*) was hidden by Lycomedes. It was also here that Lycomedes threw Theseus (*q.v.*) from a rock while the hero was in voluntary exile from Athens after giving the city its first constitution. In 470 B.C Cimon expelled the local populace in order to install Athenian colonists. At the same time he found the reputed body of Theseus and took it back to Athens amidst great pomp.

Selene. Eastern goddess whom the Greeks identified with Artemis (*q.v.*) and the Romans with Diana (*q.v.*) or the older moon goddess Luna. Both also identified her with Hecate (*q.v.*) and thus the moon became associated with sorcery.

Semele. *See* **Dionysus.**

Semiramis. The wife of Ninus. These two were the mythical founders of Ninus or Nineveh.

Seven Against Thebes. Oedipus (*q.v.*) cursed his sons for neglecting him, saying they would divide their kingdom by the sword. To avoid this Eteocles and Polynices agreed to rule in turn but Eteocles then refused to give up the throne when his term expired. Polynices sought the help of Adrastus (*q.v.*) king of Argos and married his daughter Argia while her sister married Tydeus son of Oeneus of Calydon who was in exile because of a murder he had committed. Amphiaraus the seer (brother-in-law of Adrastus) prophesied death for all who marched on Thebes save Adrastus. But on the advice of Tydeus, Polynices bribed Eriphyle into persuading Amphiaraus to join them. These four were joined by Capaneus, Hippomedon and Parthenopaeus. The seven were initially successful but Teiresias (*q.v.*) prophesied that a The ban royal prince must sacrifice himself to save the city and Menoeceus did so. The fortunes of the seven now waned. Zeus (*q.v.*) killed Capaneus with a thunderbolt as he stormed the city walls. Tydeus was wounded by Melanippus but Athene (*q.v.*) intended to save him with an elixir from Zeus. But Amphiaraus, who had a grudge against him, persuaded him to drink the brains of Melanippus which so disgusted Athene she let him die. Hippomedon and Parthenopaeus were also slain. Polynices now fought a duel with Eteocles to settle the matter and both were mortally wounded. Amphiaraus was swallowed up by the earth and only Adrastus survived. *See also* **Antigone** and **Epigoni.**

Seven Hills of Rome. The Quirinal, Viminal, Esquiline, Caelian, Capitoline, Palatine and Aventine.

Seven Kings of Rome. Traditionally said to be Romulus, Numa Pompilius, Tullus Hostilius, Ancus Martius, Tarquinius Priscus, Servius Tullius and Tarquinius Superbus.

Seven Sages of Greece. Usually held to be Thales of Miletus, Bias of Priene, Solon, Chilo of Sparta who brought the bones of Orestes (*q.v.*) to Sparta, Periander of Corinth, Pittacus of Mytilene, a democrat, contemporary of Solon and opponent of Alcaeus, and Cleobulus of Rhodes.

Sibyl (Sibylla). A priestess and prophetess who uttered oracles. Localised in several places the term came to be used generically of many sibyls and Varro lists ten. The most famous was at Cumae in Campania and she told Aeneas (*q.v.*) how to enter the Underworld. Ovid says she was seven generations old when Aeneas met her and that Apollo (*q.v.*) had granted her request to live as many years as there were grains in a handful of sand. But she had forgotten to seek eternal youth and was now withered with age. In Petronius' *Satyricon* she hangs in a bottle and when asked what she wants replies "I want to die".

Sibylline Books. A Roman tradition tells how a sibyl (*q.v.*) offered Tarquinius Priscus nine prophetic books which he refused to buy at the price. She destroyed three and he still refused them; she burnt three more and he took the remaining three at the price demanded for the nine. Special priests kept them and they were consulted only when the Senate authorised it in time of need. In 83 B.C. the originals were destroyed by fire but replaced by new ones. Many later additions were made including Jewish and Christian forgeries and fourteen still exist. They were last consulted in the 4th century A.D. and shortly afterwards Stilicho had them burnt. The original books instructed the Romans to convey the sacred stone of Cybele to Rome.

Sigeum. Part of Troy (*q.v.*). Hence the Dardanelles were known as the "straits of Sigeum".

Sileni, Silenus. Scholars distinguish between *sileni* and satyrs (*q.v.*) but the two are very similar and the Greeks themselves seem to have made no distinction. They are regarded as companions of Dionysus (*q.v.*) and have pointed ears, flat noses and the tail of a horse or goat. By the 6th century B.C. one of their number, Silenus, stands out from his fellows for his wisdom and is sometimes said to have been the tutor of Dionysus. His special knowledge comes from wine drinking and like his fellows he is usually drunk. An old man with horse-ears and tail he proves a good raconteur when captured, though something of a comic drunkard.

Silvanus. Ancient Italian god, a protector of uncultivated land.

Sinis or **Sinnis.** A robber of the Corinthian Isthmus who killed travellers by tying them to the tops of fir trees tied to the ground and then releasing the trees. Theseus (*q.v.*) slew him in the same fashion.

Sinon. A cousin of Odysseus (*q.v.*) and grandson of Autolycus the thief. When the Greeks pretended to leave Troy (*q.v.*) he remained in camp and persuaded the Trojans that the wooden horse was a gift in atonement for the theft of Athene's Palladium (*q.v.*). Once the horse was inside Troy he signalled the Greek fleet to return.

Sirens. In Homer two sisters who lure sailors to their death by their singing. Odysseus (*q.v.*) and the Argonauts (*q.v.*) withstood their fatal charms, the latter because Orpheus (*q.v.*) outsang them. They have been associated with the modern Galli islands. In non-Homeric tradition their number varies and they are portrayed as having the bodies of birds and heads of either sex. Some say they were daughters of Ge (*q.v.*) and companions of Persephone (*q.v.*) who escorted the dead to the Underworld. They were said to feed on the dead. Later they are given the heads of beautiful women and sing to console the dead they escort. Finally they lose their funerary and evil nature and develop fishes' tails like mermaids.

Sisyphus. The son of Aeolus and husband of the Pleiad Merope who bore him Glaucus. He was an ancestor of Bellerophon (*q.v.*) and also seduced Anticleia, mother of Odysseus (*q.v.*) and may have been his father. The founder of Ephyra (later Corinth) and an infamous rogue and knave he was condemned in the Underworld perpetually to push a large stone, uphill, only to see it always roll down, hence the term "labour of Sisyphus' to denote a futile task.

Sophocles. *See* **Section B.**

Spartii. "The sown men" who sprang up when Cadmus (*q.v.*) sewed the dragon's teeth. They were fully armed and fought amongst themselves until only five remained, Echion, Udaeus, Chthonius, Hyperenor and Pelorus. These helped Cadmus build the Cadmea, citadel of Thebes, and were ancestors of the Thebans. The title was also given to their descendants. Cadmus saved some of the teeth and Jason (*q.v.*) had to sow these to get the Golden Fleece.

Sphinx. A fabulous monster with a human head and the body of a lion. In Egyptian mythology where it originates it could be of either sex but in Greek myth is a female and lives north of Thebes. It was the offspring of Echidne (*q.v.*) and Typhon (*q.v.*) or possibly Orthrus (*q.v.*) and the Chimaera (*q.v.*) and plagued Thebes by strangling and devouring all who could not answer her riddle: what walks on four legs at dawn, two at noon and three in the evening? Oedipus (*q.v.*) answered correctly that it was man who first crawls, then walks upright and finally uses a stick in old age. The sphinx then leapt from her rock and was dashed to pieces.

Stentor. Greek herald in the Trojan war who supposedly had a voice equal to that of fifty men. He died after Hermes (*q.v.*) beat him in a shouting match. His name gives us the word "stentorian' meaning extremely loud.

Steropes. One of the Cyclopes (*q.v.*).

Stheneboea. Another name for Anteia. *See* **Bellerophon.**

Sthenelus. (1) A king of Mycenae, the son of Perseus (*q.v.*) and Andromeda (*q.v.*). The husband of Nicippe by whom he was the father of Alcinoe, Medusa (*q.v.*) and Eursytheus (*q.v.*).

(2) The son of Capaneus and Evadne, a companion of Diomedes (*q.v.*) and one of the Epigoni (*q.v.*). One of the Greeks in the Wooden Horse (*q.v.*).

(3) A Trojan and companion of Aeneas (*q.v.*).

Stheno. One of the Gorgones (*q.v.*).

Strymon. River in Thrace, believed by the Greeks to be the home of the crane.

Stymphalian Birds. Monsters inhabiting Lake Stymphalus, a marshy area in northern Arcadia. They were huge birds with bronze beaks and claws that ate human flesh. They used their feathers as arrows. The birds were sacred to Ares (*q.v.*) but Heracles (*q.v.*) startled them with bronze castanets provided by Athene (*q.v.*) and shot them. Some say they flew to the Black Sea and were found there by the Argonauts (*q.v.*).

Styx. The river of "hate" in the Underworld and flowing several times around its perimeter. When dipped in it Achilles (*q.v.*) was made invulnerable. Ghosts could only cross it if they paid Charon (*q.v.*) to ferry them across and for this purpose a coin was placed beneath the tongue of corpses. On its far bank was Cerberus (*q.v.*). Aristophanes (*q.v.*) and others describe it as a marsh rather than a river though Herodotus (*q.v.*) identifies it with a trickle from the rock near Pheneus. Generally it was associated with the cascade on Mt. Chelmos further west whose cold waters stain the rock black. Plutarch and Arrian say Alexander the Great was poisoned by water from here brought to him in a mule's hoof.

Sul or **Sulis.** A Celtic deity identified with Minerva (*q.v.*) by the Romans. The patron of Aquae Sulis.

Symplegades. Floating islands, like icebergs, at the entrance to the Bosphorus. They clashed together and crushed ships. Jason (*q.v.*), on the advice of Phineus, let loose a dove which made them recoil and as they did so the Argo (*q.v.*) slipped between them. Henceforth they remained stationary.

Syrinx. An Arcadian nymph. *See* **Pan.**

T

Talaus. The father of Adrastus (*q.v.*).

Talos. (1) A mythical brazen giant with a bull's head said to protect Crete.

(2) *See* **Daedalus.** Another name for Perdix.

Tantalus. A wealthy king, the son of Zeus (*q.v.*) and the nymph Pluto. The father of Pelops, Broteas and Niobe. He was favoured by Zeus and was invited to Olympian banquets but stole nectar (*q.v.*) and ambrosia (*q.v.*) and revealed Zeus' secrets. He received the golden dog made by Hephaestus (*q.v.*) for Rhea (*q.v.*) (which had watched Zeus' cradle) from Pandareus. This incensed the gods but Tantalus denied having seen it. Pandareus was then put to a miserable death and his daughters were abducted by the Harpies (*q.v.*). His numerous other crimes included serving Pelops (*q.v.*) as a meal to the gods.

For this he was punished in the Underworld, either by being placed beneath a huge rock which constantly threatened to fall and crush him or by being placed in a lake the waters of which receded whenever he tried to drink, while above his head were boughs of fruit "tantalisingly" behind his reach.

Tarchon. Legendary ancestor of the Etruscan "Tarquins" who lead a group of emigrants from Lydia to Italy and there founded Tarquinii and other Etruscan cities. He became an ally of Aeneas (*q.v.*).

Tarpeia. The daughter of Tarpeius, commander of the Roman garrison on the Capitol during the Sabine (*q.v.*) wars shortly after Rome's foundation. Her story is told by Livy. She treacherously offered to show the way into the citadel if the Sabine chief Tatius would give her that which his men "wore on their shield arms". By this she meant gold torques but instead the Sabines crushed her to death with their shields. The tale is an attempt to account for the name of the Tarpeian Rock (*q.v.*).

Tarpeian Rock. A precipice on the south-west corner of the Capitol from which traitors and other condemned criminals were thrown to their death. The last victim was an equestrian implicated in a conspiracy against Claudius in 43 A.D.

Tartarus. (1) Another name for Hades (*q.v.*) though in Homer it refers to the deepest reaches of the Underworld, a place of punishment to which the Titans (*q.v.*) and Centimani (*q.v.*) were consigned by Cronus (*q.v.*).

(2) Also the name of a son of Ge (*q.v.*) who was father, by his mother, of the monster Typhon (*q.v.*).

Teiresias or Tiresias. A blind Theban prophet, who, while young, had come upon Athene (*q.v.*) bathing in the nude. She had therefore blinded him but in compensation gave him the gift of prophecy. He revealed to Oedipus (*q.v.*) the truth of his incest. He helped Thebes against the Seven (*q.v.*) then died after drinking from the well of Tilphussa. Odysseus (*q.v.*) consulted his shade in the land of the Cimmerians.

Telamon. The son of Aeacus and brother of Peleus (*q.v.*). After the two murdered their half-brother Phocus, his father expelled him to Salamis where he married Glauce and later succeeded her father as king. Next he married Periboea of Athens and she bore him Ajax (*q.v.*). A friend of Heracles (*q.v.*) and with him sacked Troy (*q.v.*). He carried off Hesione who bore him Teucer and his refusal to return her to her brother Priam (*q.v.*) was one cause of the Trojan war.

Telchines. Mythical beings, artists in metal work who made a sickle for Cronus (*q.v.*) and the trident for Poseidon (*q.v.*). They raised the infant Poseidon. At times they were destructive and interfered with the weather. They annoyed Zeus (*q.v.*) who drowned a number of them in a flood, and Apollo (*q.v.*) who took the form of a wolf to savage them.

Telemachus. *See* **Odysseus.**

Telephassa. The mother of Europa (*q.v.*) and Cadmus (*q.v.*) by Agenor.

Telephus. The son of Heracles (*q.v.*) and Auge (a priestess and daughter of Aleus, king of Tegea). Abandoned as a child, the Delphic oracle later directed him to the court of king Teuthras in Mysia where he found his mother married to Teuthras. He later succeeded Teuthras and married Laodice, daughter of Priam (*q.v.*). When the Greeks on their way to Troy (*q.v.*) landed in Mysia he repulsed them, but Dionysus (*q.v.*) caused him to trip on a vine and Achilles (*q.v.*) wounded him. An oracle told him he could only be cured by the one who wounded him while the Greeks were told they could not take Troy without his help. He therefore went to Achilles who cured the wound with rust from his spear and in return Telephus showed the Greeks the route to Troy.

Tempe. A vale in Thessaly where Apollo (*q.v.*) pursued Daphne (*q.v.*) and was purified of the killing of Python.

Tenedos. Small island off the coast of Asia Minor, south west of Troy (*q.v.*). Here Achilles (*q.v.*) slew king Tenes (*q.v.*) and his father Cyncus and here Philoctetes (*q.v.*) was wounded.

Tenes. The son of Apollo (*q.v.*) though reputed to be son of Cycnus, king of Colonae in Troas. His stepmother attempted to seduce him and, when he refused her, made false accusations against him. Cycnus then put Tenes and his sister Hemithea into a chest and cast it adrift at sea. It washed up on the isle of Leucophrys where Tenes became king and gave his name to the island, Tenedos (*q.v.*).

Tereus. *See* **Procne.**

Terpsichore. The muse of song and choral dance, portrayed with a lyre and plectrum.

Teucer. (1) The son of Scamander (*q.v.*) and the nymph Idaca. He gave the land to Dardanus (*q.v.*) on which Dardanus built Dardania. An ancestor of the Trojans.

(2) The son of Hesione and Telamon, half brother of Ajax (*q.v.*) behind whose shield he fought at Troy (*q.v.*).

Teucri. Name for the Trojans derived from that of their ancestor Teucer (*q.v.*).

Teuthras. *See* **Telephus.** The father of the girl Tecmessa. Ajax (*q.v.*) raided the Thracian Chersonese, slew him and abducted Tecmessa.

Tethys. A Titaness, mother of Oceanus (*q.v.*) of Metis.

Thalia. (1) Muse of comedy.

(2) One of the Charities (*q.v.*).

Thebe. The wife of Zethus, who gave her name to Thebes.

Themis. A Titaness, the daughter of Ge (*q.v.*) and Uranus (*q.v.*) and sister of Cronus (*q.v.*). The wife of Zeus (*q.v.*) before Hera (*q.v.*), she bore him the Horae (*q.v.*) and Moerae (*q.v.*). She determined religious rites, instituted laws and was the first to distinguish between that which was permitted and that which offended the divine order. Hence she became the personification of justice and represented the incarnation of divine law.

Therseander. *See* **Epigoni.**

Theocritus. *See* **Section B.**

Thersites. A low-minded, ugly and mean spirited wretch amongst the Greek forces at Troy (*q.v.*). He accused Agamemnon (*q.v.*) of prolonging the war to serve his own interest until Odysseus (*q.v.*) beat him into silence.

Theseus. The son of Aethra, a princess of Troezen, by Aegeus (*q.v.*) though one tradition says Poseidon (*q.v.*) fathered him in the form of a bull.

Aegeus left her after seducing her but showed her a rock under which he had hidden his sword and sandals. Theseus was raised secretly by his mother at her father's court, and when he reached adolescence lifted the rock to claim Aegeus' sword and sandals. With these he set off for Athens and on the way had many adventures, slaying the wild sow of Crommyum, Sciron (*q.v.*), Periphetes (*q.v.*), Cercyon and Procrustes (*q.v.*). Arriving at Athens Aegeus recognised the sword and sandals and accepted him as his son despite the plots of Medea.

Theseus then scattered the Pallantides, fifty nephews of Aegeus and the sons of Pallas who hoped to claim the throne themselves. Next he captured the Cretan Bull (*q.v.*). But his greatest task was to go voluntarily to Crete to slay the Minotaur (*q.v.*). As one of the tribute demanded by Minos (*q.v.*) he was to be sacrificed to the monster but Minos' daughter Ariadne fell in love with him and gave him a sword with which to slay the beast and a thread by which he could retrace his steps through the massive labyrinth in which it lived. The couple then fled to Naxos where he left Ariadne and where she was loved by Dionysus (*q.v.*) whose sacred island it was. Aegeus tragically killed himself on Theseus' return and the hero then became king of Athens. Either alone or with Heracles (*q.v.*) he invaded the land of the Amazons and carried off either Antiope or Hippolyte. The Amazons attacked Athens but Theseus defeated them in the middle of Athens. By the Amazon queen he became father of Hippolytus (*q.v.*). Later he married Phaedra and was father by her of Acamas and Demophon (*q.v.*). A close friend of Pirithous (*q.v.*), the two shared many adventures. Eventually he returned again to Athens but was ousted by Menestheus and retired to Scyros where, for some reason he was murdered by Lycomedes.

Unlike Heracles, Theseus was not worshipped throughout the Hellenistic world but was very much an Athenian hero and his reputed bones were brought to the city from Scyros in historical times. He is said to have gathered the villages of Attica into one state by the process of *synoecismus*.

Thetis. A Nereid (*q.v.*) who was raised by Hera (*q.v.*) and remained attached to her. Zeus (*q.v.*) and Poseidon (*q.v.*) desired her but it was foretold that her son would be greater than his father. She was thus forced to marry a mortal, Peleus (*q.v.*), but only after she had tried to avoid him by changing her shape, becoming various animals including a lion. Their wedding on Mt. Pelion was attended by all the gods save Eris (*q.v.*). They had a number of children who were killed when Thetis tried to make them immortal by throwing them into the fire. Peleus snatched their seventh child, Achilles (*q.v.*), from her as she tried yet again. Instead she dipped him in the Styx (*q.v.*). Angry at not giving birth to an immortal she left Peleus to live with her sister Neireids. She cared for Hephaestus (*q.v.*) when Zeus threw him into the sea, and for Dionysus (*q.v.*) though she and Briareus (*q.v.*) freed Zeus when the other gods enchained him.

Thoas. The son of Andraemon king of Calydon who took forty ships to Troy (*q.v.*) and was one of the Greeks in the Wooden Horse (*q.v.*).

Thyades. *See* **Thyia.**

Thyestes. The son of Pelops (*q.v.*) and Hippodamia and brother of Atreus, ancestor of the illustrious Atridae family. He and Atreus murdered their half-brother Chrysippus and fled to Mycenae. Here Atreus seized the kingdom and banished Thyestes. Thyestes had seduced Atreus' second wife Aerope and he now tricked Atreus into killing Pleisthenes, his son by his first wife. In revenge Atreus lured Thyestes to Mycenae, slew his three sons and served them to him. Thyestes unknowingly ate them. Not surprisingly he cursed the house of Atreus on learning the truth. The Delphic oracle told Thyestes he could get revenge by fathering a son on his own daughter Pelopia, a priestess at the court of Threspotus of Sicyon. He raped her and Atreus later married her, believing her to be the daughter of Threspotus. He raised Thyestes' son Aegisthus as his own.

Thyia. The first woman to worship and sacrifice to Dionysus (*q.v.*). She gave her name to the Attic women who participated in the orgies of Dionysus at Parnassus, the Thyiades. These women were also called Thyades, "raging women", a similar name but of different origin.

Thyone. *See* **Semele.**

Thyrsus. A wand carried by the Maenads, covered with ivy wreaths and surmounted by a fir cone.

Tiryns. City reputedly founded by Proetus (*q.v.*) and built with the help of the Cyclopes (*q.v.*). The actual site is a mound 300 yd long on the Gulf of Argolis. It was first inhabited in the 3rd millennium B.C. and held a chief's residence and town. Around 1600 B.C. a larger palace was built and ramparts constructed. In the 14th and 13th centuries the rampart was rebuilt and enlarged. Its impressive ruins remain.

Tisiphone. One of the Eumenides (*q.v.*).

Titanesses. Sisters of the Titans (*q.v.*), daughters of Ge (*q.v.*) and Uranus (*q.v.*). Their numbers included Rhea (*q.v.*), Themis (*q.v.*), Tethys and Mnemosyne.

Titanomachia. The ten-year war, waged in Thessaly by Zeus (*q.v.*) and the Olympian gods against Cronos (*q.v.*) and the Titans (*q.v.*) led by Atlas (*q.v.*). Ge (*q.v.*) promised Zeus (who had usurped his Titan father Cronos) victory if he would free the Cyclopes (*q.v.*) and Hecatoncheires (*q.v.*) from Tartarus (*q.v.*). He did and the Cyclopes gave him the thunderbolt, Hades (*q.v.*) a helmet which conferred invisibility and Poseidon a trident. The three overcame Cronos and the Hecatoncheires stoned the other Titans who were defeated and consigned either to Tartarus or an island far to the west. Here the Hecatoncheires guarded them. Atlas was made to carry the sky as punishment but the Titanesses (*q.v.*) were spared. The war is the basis of Keats' *Hyperion*.

Titans. The sons of Ge (*q.v.*) and Uranus (*q.v.*). There were twelve of them though the lists given of their names are inconsistent. The most often named are Cronus (*q.v.*), Oceanus (*q.v.*), Hyperion, Iapetus and Atlas (*q.v.*). Brothers of the Titanesses (*q.v.*). When Uranus consigned the Cyclopes (*q.v.*) to Tartarus (*q.v.*) Ge persuaded Cronos and his brother Titans to depose Uranus. The Titans were in turn deposed in the Titanomachia (*q.v.*).

Tithonus. The son of Laomedon and Strymor and a half-brother of Priam (*q.v.*). By Eos (*q.v.*) the father of Memnon (*q.v.*). Eos begged Zeus (*q.v.*) to make him immortal, which he did, but forgot to ask for perpetual youth. Tithonus grew older and older until Eos tired of looking on him, turned him into a cicada and locked him in a cage.

Tities. One of the three primitive tribes of Rome.

Tityus. A giant son of Ge (*q.v.*) sent by Hera (*q.v.*) to violate Leto (*q.v.*) but Artemis (*q.v.*) and Apollo (*q.v.*) slew him with their arrows. In Hades (*q.v.*) he was pegged to the ground (he covered nine acres) while two vultures picked at his liver.

Tleopolemus. A son of Heracles (*q.v.*) who settled in Argos and later Rhodes.

Triptolemus. *See* **Demeter.**

Triton. The son of Poseidon (*q.v.*) and Amphitrite (*q.v.*) though sometimes several tritons are spoken of. He was a merman, his upper body being human, the lower fish. He blew a shell-trumpet, the concha, to calm the waves and Ovid tells us that he blew the concha to order the waters to recede after the Flood. (*See* **Deucalion**).

Troilus. A young son of Priam (*q.v.*) slain by Achilles (*q.v.*). His romance with Cressida is a medieval invention.

Trojan War. The ten-year siege of Troy (*q.v.*) and its eventual sack by Greek forces under Agamemnon (*q.v.*). The combined forces sought to restore Helen (*q.v.*) to Menelaus (*q.v.*). The story of the war is told in Homer's *Iliad* where Achilles (*q.v.*) is the major hero of the Greeks and Hector (*q.v.*) of the Trojans. According to Homer the war was ended by the Wooden Horse (*q.v.*) concocted by Odysseus (*q.v.*). The war is usually placed by tradition as occurring in the 12th century B.C. The war is not a purely mythical episode. Archaeological evidence from the site of Troy shows that the city occupying the seventh stratigraphical layer was destroyed by fire, though probably in the 14th century B.C. Archaeology also confirms the *Iliad's* description of the main towns in Trojan civilisation together with its picture of the Greek people and army.

Trophonius and **Agamedes.** Sons of Erginus who built a temple for Apollo (*q.v.*) at Delphi. They were rewarded by living merrily for six days and dying in their sleep on the seventh. Trophonius later had an oracle of his own at Lebadeia in Boeotia. Here, according to Pausanias, the questioner underwent a complex initiation, was dressed as a sacrificial victim and (carrying a honey-cake to placate the Underworld divinities) descended into a pot-hole. An underground stream swept him along some distance before he was returned to the light having heard invisible speakers in the cavern. Not surprisingly the questioner would look dazed and dejected and it became common to speak of a gloomy person as one who had been consulting Trophonius.

Tros. (1) The grandson of Dardanus (*q.v.*) and father of Ilus (*q.v.*) and Ganymede (*q.v.*). An ancestor of the Trojans, he gave his name to Troy (*q.v.*).

(2) A small town absorbed by the city of Troy (*q.v.*).

Troy. Also called Ilium, a city of Asia Minor near the sea not far from the straits of the Dardanelles. From its position the inhabitants could watch the sea traffic between the Aegean and Sea of Marmara. Many traders off-loaded cargo and used the land route to bypass the dangerous straits. Hence in the late 3rd millennium B.C. Troy became very prosperous from trade, a prosperity which returned at various periods in the 2nd millennium. In 1870 the German Heinrich Schliemann, an amateur archaeologist, sought the site near modern Hissarlik in Turkey. He found it and later excavations have distinguished nine strata of occupations, the richest dating from 2200 B.C and the 7th showing signs of destruction by fire (*See* **Trojan War**). From the 14th century B.C. the site was of little importance until the Roman occupation when, as Ilium Nevum, it played a large part in provincial life. Homer's Troy had probably absorbed three neighbouring towns, Tros (*q.v.*), Dardania and Ilium and the names of three tribes, Ilians, Trojans and Dardanians are represented in the myths of its foundation.

Tyche or **Tuche.** The Roman "Fortuna", and always more popular in Rome. A daughter of Zeus (*q.v.*) and the goddess of luck who bestowed or denied gifts to men according to her whims. She often accompanied Pluto (*q.v.*). She is portrayed juggling a ball, symbolising the instability of fate, or with a rudder to guide men's affairs.

Tydeus. Son of Oeneus and Calydon, husband of Deipyle. After committing a murder in his youth he fled to the court of Adrastus (*q.v.*). *See* **Seven Against Thebes.**

Tyndareus. The brother of Hippocoon who deposed him as king of Sparta, but Heracles (*q.v.*) reinstated him. Helen (*q.v.*) was brought up at his court (she was his wife Leda's (*q.v.*) child by Zeus (*q.v.*)). Helen married Menelaus (*q.v.*) who succeeded Tyndareus. Tyndareus had had all the Greek nobles who sought Helen's hand swear an oath to defend her chosen husband. This was the reason why the Greeks allied in support of Menelaus in the Trojan War (*q.v.*). Tyndareus also helped Agamemnon (*q.v.*) expel Thyestes (*q.v.*) and regain his throne.

Typhon. The monstrous offspring of Ge (*q.v.*) and Tartarus (*q.v.*), whose eyes could expel fire and whose limbs ended in snakes' heads. He attacked Olympus and the gods fled to Egypt disguised as animals, Zeus (*q.v.*) as a ram, Apollo (*q.v.*) as a cow, Dionysus (*q.v.*) as a goat, Hera (*q.v.*) as a white cow, Artemis (*q.v.*) as a cat, Aphrodite (*q.v.*) as a fish, Ares (*q.v.*) as a boar and Hermes (*q.v.*) as an ibis. Athene (*q.v.*) did not flee and persuaded Zeus to fight. In a great struggle Zeus was saved by Hermes and Pan (*q.v.*) and then defeated Typhon with his thunderbolts. He was then buried under Mt. Etna. By Echidne (*q.v.*) Typhon was father of a variety of monsters.

Tyro. A nymph, the mother of Pelias (*q.v.*) and Neleus (*q.v.*) by Zeus (*q.v.*) and of Aeson by Cretheus. The grandmother of Jason (*q.v.*).

U

Udaeus. One of the Spartii (*q.v.*).

Ulysses. The Roman name for Odysseus (*q.v.*).

Urania. The Muse of Astronomy.

Uranus. The Sky, offspring of Ge (*q.v.*) the earth and brother of Pontus, the sea. The father by Ge of the Hecatoncheires (*q.v.*), the Cyclopes (*q.v.*) and the Titans (*q.v.*). He threw the rebellious Cyclopes into Tartarus (*q.v.*). Ge then persuaded the Titans to rise against their father and avenge their brothers. She gave Cronos (*q.v.*) a flint sickle with which he castrated Uranus. The blood of Uranus which fell to earth produced the Erinyes and the blood which fell into the sea produced Aphrodite (*q.v.*). Uranus was deposed but cursed Cronos that his own children depose him.

V

Venus. Originally an Italian deity whose name meant "beauty" or "charm", she was a goddess of vegetable rather than animal fertility. She became identified with Aphrodite (*q.v.*) by way of Aphrodite's cult at Mt. Eryx in Sicily, said to have been founded by Aeneas (*q.v.*) on the death of Anchises (*q.v.*). In 217 B.C. Venus Erycina was given a temple at Rome and became completely associated with Aphrodite taking on her functions and attributes. She was patron goddess of Sulla and Pompey. In the imperial cult she played a very important role as the Julian family claimed descent from Aeneas and therefore Aphrodite. In this context she was Venus Genetrix, creator of all things, the universal mother and life giver.

Vesta. A primitive Roman goddess of the hearth, the counterpart of Hestia (*q.v.*). She was worshipped in each Roman house and officially in a circular temple in the Forum. The temple held a fire, said to have come from Troy (*q.v.*) which could never be allowed to go out. It was tended by the Vestal Virgins (*q.v.*). Her cult was purely Italian and never spread to the provinces.

Vestal Virgins. A college of priestesses of the cult of Vesta (*q.v.*). There were originally four of them, later six and finally seven. Candidates for the college were chosen at between six and ten years of age; both their parents had to be alive and they underwent a prolonged special training. They served for thirty years under the control of the Pontifex Maximus and during all this period had to remain virgins. The punishment for unchastity was burial alive. However they were highly honoured and had great privileges. For instance they could save from execution any criminal they met on the way to his death. They lived in a large residence near the temple of Vesta.

The sacred fire of Vesta was tended by Vestal Virgins up to the 4th century A.D.

Victoria. The Roman goddess of victory, corresponding to the Greek *Nike* (*q.v.*).

Virgil. *See* **Section B.**

Vulcan. The Roman god of fire, identified with Hephaestus (*q.v.*) and sometimes called Mulciber, "the smelter". His name gives us the word "volcano".

W

Wooden Horse of Troy. The "Trojan Horse", a stratagem devised by Odysseus (*q.v.*) which ended the Trojan War (*q.v.*). The Greeks had Epeius, son of Panopeus, build a large wooden horse. Athene (*q.v.*) helped him and it bore an inscription dedicated to her. Then twenty-three or more Greeks including Odysseus, Neoptolemus (*q.v.*), Sthenelus and Thoas hid inside it. The rest of the Greek force then burnt their camp and put to sea leaving only the wily Sinon (*q.v.*) to trick the Trojans into dragging the horse into Troy. (*See also* **Laocöon**).

Inside the city Helen patted the horse and called out the names of those she suspected were inside it, but she was accompanied by the Trojan prince Deiphobus and Odysseus stopped the Greeks answering. At night the Greek fleet returned, Sinon let the men out of the horse, the gates of Troy were opened and the city was sacked.

X

Xenophon. *See* **Section B.**

Xuthus. The son of Hellen and husband of Creusa, the daughter of Erectheus, king of Athens. By her the father of Achaeus and Ion. On the death of

Erectheus Xuthus was asked to determine which of the king's sons should succeed him. He chose Cecrops and was expelled to Achaia by the other heirs. Euripedes (*q.v.*) makes Ion the son of Apollo (*q.v.*) and Creusa.

Z

Zagreus. A son of Zeus (*q.v.*). He was torn apart and eaten by Titans (*q.v.*) except for his heart which Athene (*q.v.*) saved. He is sometimes identified with Dionysus (*q.v.*).

Zephyrus. The son of Astraeus and Eus. He was the west wind, originally imagined, like all winds, in the form of a horse. The father of Xanthus and Balius, the talking horses of Achilles (*q.v.*) which Poseidon (*q.v.*) had given to Peleus (*q.v.*) as a wedding gift. The husband of Iris (*q.v.*). He deflected the discus which killed Hyacinthus (*q.v.*). His Roman counterpart was Favonius.

Zetes. *See* **Calais.**

Zethus. *See* **Amphion.**

Zeus. The son of Cronos (*q.v.*) and Rhea (*q.v.*). He deposed his father and defeated the Titans (*q.v.*). Then he and his brothers Hades (*q.v.*) and Poseidon (*q.v.*) cast lots for their kingdoms and Zeus won the sky. The earth was common to all. Zeus was the king of the gods and was identified with Jupiter by the Romans. He was the father of men. In early legend his consort is Dione, but his consort on Mt. Olympus (*q.v.*) is the jealous Hera (*q.v.*). He first married Hetis who bore him Athene (*q.v.*) and his second wife was Themis (*q.v.*) who bore him the Horae and Maerae. Hera bore him Ares (*q.v.*), Hebe (*q.v.*) and Hephaestus (*q.v.*). His sister Demeter (*q.v.*) bore him Persephone (*q.v.*) and Eurynome bore him the Charities (*q.v.*) while by Mnemosyne he was father of the Muses (*q.v.*). By mortal women he was father of Hermes (*q.v.*), Apollo (*q.v.*) and Artemis (*q.v.*) and Dionysus (*q.v.*). Given the thunderbolt by the Cyclopes (*q.v.*) he was known as the thunderer.

SPECIAL TOPIC

NORSE MYTHOLOGY

Introduction.

The Norse myths have never enjoyed in Britain the same cultural esteem and popularity as the myths of Greece and Rome. At best they have been deemed inferior, more normally they have been simply ignored. The celebrated nineteenth-century designer, William Morris, is perhaps the only well-known Briton to have taken them with real seriousness.

There are a number of possible causes of this neglect. We know very little, for example, about the associated religious observances and rites, which would have given them meaning to the individual. They may never even have truly developed. Julius Caesar, writing of the Germanic peoples as a whole more than one thousand years before Scandinavia was converted to Christianity, observed that they had no priests comparable to the Celtic druids and had little interest in ritual. He believed that they found religious significance rather in the depths of the forests.

Their Relative Inaccessibility.

Moreover, the Norse myths have never exercised the direct influence on art and literature that their classical counterparts have done. This may be explained to no small degree by their inaccessibility until comparatively recent times. The myths of the Germanic peoples—encompassing the Anglo-Saxons, the Germans, and the Scandinavians or Vikings—remained a living tradition longest in Viking Iceland which was one of the last places in Europe to be converted to Christianity. We owe their preservation to a Christian priest, Saemund, who wrote down the Elder Edda, in which the oral traditions were collected, and to Snorri Sturluson who at the beginning of the thirteenth century wrote a guide to the myths for poets. Both wrote in Old Icelandic, hence our designation of the myths as specifically Norse myths. The Icelandic language, however, was virtually unknown outside its remote homeland until the end of the eighteenth century.

The Case of Beowulf.

Mention must also be made of the Anglo-Saxon epic poem Beowulf. It necessarily stands somewhat apart by virtue of the seventh-century date of its composition and its preservation in a language other than Icelandic, but there are numerous cross-references in it to specifically Norse mythology.

Norse Myths and our Ancestors.

Such causes, though, do not make the neglect of the myths any less regrettable, for a wide range of reasons. One of the most important is that although they were preserved specifically as the myths of the early Scandinavians, most familiar to us as the feared Vikings of the tenth and eleventh centuries, they were common, with variations over time and from place to place, to the early Germanic peoples as a whole, including the Anglo-Saxons, the direct ancestors of the modern English. They are thus the best reflection we have of the thought-world of our earliest ancestors. It is a thought-world which has literally left its mark. If the global worship of the sun and moon has given us Sunday and Monday, then the father of the gods, Odin, in his Anglo-Saxon form of Woden, has given us Wednesday, his son Thor has given us Thursday, and his wife Freya has given us Friday. Tuesday takes its name from the goddess Tiwe, only known from Anglo-Saxon sources. Freya has also bequeathed the German *Frau* and Swedish *Fru*, both meaning "Mrs."

Place Names and Norse Mythology.

English place names similarly preserve this mythological heritage. Wednesbury and Wednesfield, both in the West Midlands, preserve the name of Woden; Thoresby, Thoresway and Thorganby, all in Lincolnshire, and Thorlby and Thormanby in North Yorkshire, preserve the name of Thor through the personal name of the original Viking settler. They remind us similarly, as does the prevalence of the Scandinavian ending "by", meaning village, of the very extensive settlement by the Vikings of the eastern counties. Thundersley in Essex not only preserves the name of Thor in its Anglo-Saxon form of Thunor but vividly recalls the thunder which he created through the crash of his hammer on his anvil.

Not least, Odin or Woden had the alternative name of "Grim" and the prehistoric earthworks across England known as Grimsditch or Grimsdyke and Grimes Graves record the readiness of the early Anglo-Saxon settlers to attribute anything marvellous to the greatest of their gods.

The Bleak Norse World.

This geographical legacy gives an invaluable insight into the establishment of the English nation we know today, but the myths live on much more significantly in the essentially subconscious psychological continuities. Their world was a bleak one, overshadowed by a sense of doom and foreboding and the threat of Ragnarok, Wagner's *Götterdämmerung*, the twilight of the gods. The image of Hel, the ruler of the underworld, who was semi-decomposed with the face and trunk of a living woman but the legs and thighs of a dead one, conveys some of its grimness. We have inherited such words as hell and grim for good reason—some might even prefer the Christian tradition of the fiery furnace!

The Divine Actors.

The myths were complex although, at least by the time they were written down, coherent. The main protagonists are set out later in the Glossary.

The Psychological Heritage.

One can see the psychological continuity of this bleak world, full of doom and foreboding, in the black humour which comes so naturally to the English but is so alien, for example, to the French, and the thread of the sombre and the macabre which permeates so much Germanic literature, whether it be Shakespeare, the German Romantics, or such Scandinavian dramatists as Ibsen and, particularly, Strindberg.

Rather remarkably, 80% of Icelanders allegedly still believe in the existence of elves, and roads have been rerouted to avoid them. Other manifestations of the enduring mind-set of the myths may be more controversial. Parallels have been drawn between the impending catastrophe of Ragnarok and the medieval German obsession with the Last Judgement, which was a major inspiration of the greatest German painting, Matthias Grünewald's Issenheim altarpiece, now preserved in the Alsatian city of Colmar.

It is also certainly the case that modern European environmentalism owes much to the Germanic sense of the religious significance of the forest noted by Caesar. The German Green Party became a political party of lasting significance in response to growing national alarm at the death of German forests as a consequence of sulphur pollution.

A Greatness of Soul.

The myths of the north may have been bleak but they were never ignoble. The nineteenth-century English writer, Thomas Carlyle, maintained that they "have a truth in them, an inward perennial truth and greatness. It is a greatness not of mere body and gigantic bulk, but a rude greatness of soul." Perhaps its finest expression in English is in the Anglo-Saxon poem "The Battle of Maldon", commemorating, slightly ironically, the defeat of the now Christianised Anglo-Saxons at the hands of the Vikings, when the Anglo-Saxon warrior exhorts his comrades: "Thought shall be the harder, heart the keener, courage the greater, as our might lessens." A similar spirit has even been seen in the ferocious German resistance in the Second World War, continuing long after the War was clearly lost.

A Source of Inspiration Missed?

A rather different reason to regret the neglect of the Norse myths is suggested by comparing a hope expressed by William Morris with the reality of Wagner's triumph in composing his operatic masterpiece *Der Ring der Nibelungen*, or simply "The Ring". Morris maintained: "This is the great story of the North, which should be to all our race what the Tale of Troy was to the Greeks—to all our race . . . when the change of the world has made our race nothing more than a name of what has been –a story too—then should it be to those that come after us no less than the Tale of Troy has been to us." Such a hope has an unfashionable sound at the beginning of the twenty-first century but even the most superficial acquaintance with Richard Wagner's operatic cycle, widely valued as one of the world's greatest cultural achievements, gives rise to a suspicion that a great source of inspiration has been missed by so many others. The suspicion is not diminished by a consciousness of the limited relevance of so much classical imagery to northern climes. The inspiration there has been, as in the novels of J.R.R. Tolkien, is at most tangential.

Wagner and Norse Mythology.

Wagner drew on some specifically German legends, but the proceedings are dominated by Wotan (Odin or Woden), the father of the gods, Freya, his wife, and Brünnhilde, his daughter. Wagner uses the myths for his own purposes, but in so doing he reminds us, as have the countless writers and artists who have reinterpreted the classical myths, that myths are more than legends. Legends are usually rooted in historical fact, however distorted by time. Myths, however, are an attempt to understand the human condition and, as such, exist outside time. Wagner's Wotan is the quintessential father—stern but caring. Freya is the quintessential jealous wife, hurt and outraged by her husband's compulsive pursuit of the latest pretty face glimpsed on earth. Brünnhilde is the eternal disobedient daughter. Age is permanently threatened by the youth which will supplant it.

Moreover the Norse myths provided Wagner with a vision which the classical myths had apparently lost: a vision in which the gods themselves would come to an end. *Götterdämmerung*, the Twilight of the Gods, the last of the Ring cycle, sees decay of the earth and the heavens in which the gods perish as surely as the world beneath.

The Sense of Divine Impotence.

The vision is as powerful as that of Dante's Divine Comedy, although obviously the reverse of Christian, but the concept of the ultimate impotence of the gods is found likewise at the opposite end of the Indo-European world, in Hindu India. There is a celebrated passage in the Rig-Veda, a sacred Sanskrit text dating from 1500–900 B.C., on the subject of creation, which concludes:

Only he who is overseer in highest heaven knows,
He only knows, or perhaps he does not know!

Parallels with Classical Mythology.

This sense of divine ignorance or impotence, which contrasts so strongly with the omnipotent deity of Judaism, Christianity and Islam, underlines another reason for valuing the Norse myths. The gods of the Germanic world, of the classical world and of India were all intimately related, and originally the same. Thor is paralleled by the Latin Vulcan, Freya by the Latin Venus and Greek Aphrodite, all voluptuous goddesses of love. Where those of Europe diverged from those of India was in making one god, in practice a "father god", the ruler of the rest, call him Zeus, Jupiter or Odin-Woden.

The Norse myths open a window not just on the thought-world of our own Germanic ancestors, but also on that of their ancestors across Europe, Iran and India whom we can otherwise approach only through archaeology.

An Untapped Potential?

Norse mythology and religion, moreover, were not static, and one last reason for valuing them is the light they throw on European man's deepest psychological needs in the absence of Christianity. One of the more unpredictable developments was a growing belief that Ragnarok would not mark the total end of the world and the gods and their submission to Jormungand, the immense world serpent, but that a fair, green new world would arise out of the water, and that several of the gods would survive, including Baldr who would return from the dead. A second was that Thor became an increasingly personal deity and by the end of the Viking period had become a greater god than his father, Odin. The magic hammer, Mjollnir, with which he wielded destruction was also a force for fertility and resurrection.

Were these echoes of distant Christianity or was Christianity, when it arrived, itself but a further response to existing aspiration and even faith? We can never know, but the parallel myths of India were to flourish until our own time, associated with the imposing wealth of religious mysticism and philosophy which is the great creation of Hinduism. The religious potential of the north could have proved similarly unexpected.

GLOSSARY

Note: Some mythological names have come down to us from different sources and are not, therefore, spelt consistently. Moreover, the Germanic languages were highly inflected and names varied accordingly, *e.g.* Kriemhild, Kriemhilde, Kriemhilden (Gudrun). The more significant variations include Balder and Baldr; Brynhild, Brünhild, Brünnhilde and Prünhilt; Thonur and Thor; and Woden and Wotan.

Ægir. The god of the sea, sometimes known by the epithet "the ale-brewer".

Æsir. Generic name for the gods led by Odin (*q.v.*).

Alfheim. The elvish homeland. *See* **Elves**.

Andvari. Loki (*q.v.*) compelled this dwarf (*q.v.*) to surrender his hoard of gold. Andvari put a curse of death on a ring from this treasure: the curse was eventually responsible for the death of Sigurd (*q.v.*).

Angrboda. "Bearer of Grief". Loki's (*q.v.*) consort, a frost giantess and mother of Fenrir (*q.v.*), the Midgard serpent (*q.v.*) and Hel (*q.v.*).

Apples of Youth. (Golden Apples of Idunn). Magical fruit which preserved the gods' eternal youth. Under duress, Loki (*q.v.*) stole them for the giant Thjazi (*q.v.*). The Æsir (*q.v.*) promptly began to age and soon found Loki out. He was then forced to recapture the apples, which he successfully did disguised as a falcon.

Asgard. Home of the gods led by Odin (*q.v.*).

Baldr. His name means "lord". A warrior hero of celestial birth. Snorri Sturluson identified him as Odin's (*q.v.*) blond son "the shining sky-god". However, there is no evidence that Baldr was part of traditional Germanic myth. His mother the goddess Frigg (*q.v.*) ensured his invulnerability on earth by asking all terrestrial things to swear they would not hurt him. Subsequently, the Æsir (*q.v.*) tested him with spears and stones. According to Snorri, the troublemaker Loki (*q.v.*) discovered that misletoe had not been accounted for and provided the blind god Hod (*q.v.*) with a dart made of this wood. Once shot at Baldr, the dart killed him and he descended to Hel (*q.v.*).

There is also some variation in this story with the writer Saxo Grammaticus suggesting that Hod alone was responsible for Baldr's death. The detail of the misletoe may be a late addition, possibly a misunderstanding caused by the name of the magic sword *Mistilleinn*, with which Hod killed Baldr in Saxo's account. Baldr is sometimes seen as a Christ-like figure due to his lead role in the "resurrection" of the world after Ragnarok.

Baugi. The brother of the giant Suttung (*q.v.*). He helped Odin (*q.v.*) steal the Mead-of-Inspiration (*q.v.*) from his brother.

Bragi. The god of poetry, possibly a personified facet of Odin (*q.v.*). Married to Idunn (*q.v.*).

Brynhild. A beautiful Valkyrie (*q.v.*) released from a curse of sleep in a ring of fire by Sigurd (*q.v.*). Despite falling in love with Brynhild, Sigurd subsequently married Gudrun (*q.v.*) due to the effects of a magic drink, and then convinced his foster brother Gunnar (*q.v.*) to seek Brynhild's hand. However, Gunnar could not enter the ring of fire, so Sigurd adopted his likeness and wooed Brynhild as his brother. Brynhild became aware of the trick and vowed to revenge herself on her former lover. Pressed by Gunnar and his brother Hegni, her brother-in-law Guttorm killed Sigurd whilst he was in bed, but she was then overwhelmed with remorse and killed herself on Sigurd's funeral pyre. Her story is told in the Old Norse *Volsunga Saga* (*q.v.*) and the Germanic *Nibelungenlied* (*q.v.*), where she is called Prünhilt.

Disir. The Norse goddesses.

Draupuir. Odin's (*q.v.*) gold ring. The origin of all others.

Dwarves. Swarthy elves (*q.v.*), naturally treacherous, who lived underground. Also known as trolls.

Elves. Supernatural creatures below the level of gods. There were two types of elves: swarthy ones who dwelt within the earth and brilliant ones who lived in Alfheim (*q.v.*).

Fafnir. The brother of Regin (*q.v.*), originally a man but then transformed into a dragon. At Regin's request, Sigurd (*q.v.*) killed Fafnir and ate his heart. He and Regin thus obtained the hoard of gold which the dragon guarded. The story is in the *Volsunga Saga* (*q.v.*) and the *Nibelungenlied* (*q.v.*).

Farbauti. A giant and the father of Loki (*q.v.*).

Fenrir. The wolf-son of Loki (*q.v.*) and Angrboda (*q.v.*). The gods heard that he would one day destroy the world and so attempted to tie him up. However, Fenrir repeatedly broke out of his chains and eventually the gods turned to the dwarves (*q.v.*) to make a magical fetter. Fenrir took his chaining up as a challenge and agreed to accept the dwarves chain, but only on condition that one of the gods put their hand into his mouth in case it was a trick. Only Tyr (*q.v.*) had the courage to do so and when Fenrir found he was trapped, lost his hand, bitten off by the wolf.

Fitela. Nephew of Sigmund (*q.v.*).

Fjorgyn. A goddess of fertility and the mother of Thor (*q.v.*).

Freyja. The chief Vanir (*q.v.*) goddess, a symbol of promiscuity and fertility. Daughter of Njord (*q.v.*) and twin sister of Freyr (*q.v.*). Her most prized possession was the *Brisingamen* necklace. One of her magical powers was her ability to turn into a falcon at will. The Frost Giants (*q.v.*) made repeated attempts to win her. She married Od (*q.v.*).

Freyr. Son of Njord, twin brother of Freyja and one of the greatest of the Vanir (*q.v.*). His cult was associated with fertility and often linked with horses and boars (established fertility symbols). Freyr also had connections with the sea. He married the giantess Gerd (*q.v.*).

Frigg. Odin's (*q.v.*) wife, a fertility goddess linked with Freyja (*q.v.*), with whom she is sometimes confused. Frigg seems to have represented the maternal side of fertility, Freyja the more promiscuous. Frigg was the mother of Baldr (*q.v.*). She was said to know the fate of all men.

Frija. Wife of Woden (*q.v.*).

Frost Giants. The enemies of the Æsir (*q.v.*). Springing from the feet of the giant Ymir (*q.v.*) all the Frost Giants died when Ymir was killed by the Æsir, with the exception of Bergelmir. Bergelmir fostered a new race who lived in Iotunheim.

Garm. The hound of Hel (*q.v.*), possibly an alternative version of Fenrir (*q.v.*).

Gerd. Wife of Freyr (*q.v.*) and daughter of the giant Gymir.

Gimli. The gilded hall in Asgard (*q.v.*) to which good men went after death.

Ginnungagap. The original space between Muspellsheim (*q.v.*) and Niflheim (*q.v.*).

Gudrun. In *Volsunga Saga*, Sigurd's (*q.v.*) wife and one of the Nibelungs. On his death she married Atli. She is known as Kriemhilt in the *Nibelungenlied* (*q.v.*).

Gunnar. The foster-brother of Sigurd (*q.v.*) and husband of Brynhild (*q.v.*).

Heimdall. The guardian of Asgard (*q.v.*) and offspring of "nine giantesses". Associated with Freyja (*q.v.*) and possibly one of the Vanir (*q.v.*), he will be the herald of Ragnarok (*q.v.*). Heimdall was the enemy of Loki (*q.v.*).

Hel. The daughter of Loki and the frost goddess Angrboda. The ruler of the underworld where she was more powerful than Odin, although banished there by him.

Helgrind. The gate between the world and the underworld.

Hod. The blind god who killed Baldr (*q.v.*).

Hreidmar. The father of Fafnir (*q.v.*) and Regin (*q.v.*), by whom he was murdered.

Idunn. Goddess and guardian of the Apples of Youth (*q.v.*). Married to Bragi (*q.v.*).

Iotnar. The race of the giants, probably envisaged as types of demons or trolls.

Iotunheim. The land of the Frost-Giants (*q.v.*).

Irminsul. The central pillar of the world. *See* **Yggdrasil**.

Kvasir. After a great battle between the Æsir (*q.v.*) and the Vanir (*q.v.*), peace was made and sealed by all parties spitting into a cauldron. From this spittle the gods made Kvasir, a being of supreme wisdom. However, Kvasir was killed by two dwarves (*q.v.*) who brewed the Mead-of-Inspiration (*q.v.*) from a mixture of his blood and honey.

Loki. Part god, part demon and the son of the giant Farbauti (*q.v.*). Loki was a mischievous god of ambivalent loyalties, whose cheekiness resulted in him often being portrayed in comic terms. He was a master of disguise and shape-changing. Loki was central in the killing of Baldr (*q.v.*) and was consequently punished by the Æsir (*q.v.*) by being bound beneath the dripping jaws of a venomous snake. His writhing produces earth tremors and he will remain in agony until Ragnarok (*q.v.*). He married Sigyn (*q.v.*).

Mead-of-Inspiration. A drink-inspiring poetic eloquence and wisdom, brewed by dwarves (*q.v.*) from the blood of Kvasir (*q.v.*). Suttung (*q.v.*) took the Mead from the dwarves as compensation for the death of his father and killing of his mother. Through trickery it finally came to Odin (*q.v.*).

Midgard. The world of men or "middle earth". Made by the Æsir (*q.v.*) from the body of Ymir (*q.v.*).

Midgard Serpent. The world serpent, which coils around the earth and keeps it in place. Twice (inconclusively) pitted against Thor (*q.v.*), the two will once again face each other at Ragnarok (*q.v.*) when the serpent will rise from the sea and flood the earth. The Midgard serpent seems to have been generally seen as a malevolent creature.

Mimir. One of the Æsir (*q.v.*) and possibly a giant. Mimir was sent with Hoenir as a hostage to the Vanir (*q.v.*) as part of a truce package. However, the Vanir killed him by cutting off his head, which they then returned to Odin (*q.v.*). Odin enchanted the head and gave it powers of speech. Mimir's head could then tell hidden things and Odin regularly consulted it.

Mimir, the Spring of. A font of wisdom for all who drank from it, situated below the root of Yggdrasil (*q.v.*) in the land of the Frost Giants (*q.v.*). Odin gave up one of his eyes as the price for obtaining a drink from it. There is some confusion as to whether this Mimir is the same as the beheaded giant (*q.v.*). It may be that Mimir is here used as a general term for "giants".

Mjollnir. Thor's (*q.v.*) magic hammer, made by dwarf (*q.v.*) craftsmen.

Muspell. A personification of Muspellsheim (*q.v.*). Muspell's sons fight on the side of the fire giant Surt (*q.v.*) at Ragnarok (*q.v.*).

Muspellsheim. The southern part of the world, an area of fire and light in opposition to Niflheim (*q.v.*). The home of the Muspell (*q.v.*). Sparks from Muspellsheim melted the ice of Niflheim and created the first life, the giant Ymir (*q.v.*).

Nanna. The wife of Baldr (*q.v.*).

Nibelungenlied. The medieval German epic poem telling the story of the father and son heroes Siegmund (Norse Sigmund) and Siegfried (Sigurd). The same material is also found in the Old Norse *Volsunga Saga* (*q.v.*).

Nidhogg. A voracious dragon who steals corpses. Also the name of the snake which gnaws at one of the roots of Yggdrasil (*q.v.*).

Niflheim. The northern part of the world, an area of ice and darkness in opposition to Muspellsheim (*q.v.*). Niflheim was the kingdom of Hel (*q.v.*), the goddess of the dead.

Njord. God of seafaring, fishing and plenty. He married the giantess Skadi (*q.v.*).

Norns. The three guardians of the Well of Urd—the Spring of Fate—at the foot of Yggdrasil (*q.v.*). They were named Urd (past), Verdandi (present) and Skuld (future). *See also* **Wyrd**.

Od. The husband of Freyja (*q.v.*), whom he later abandoned.

Odin. The greatest of the gods and the father of the divine family. The personification of the air, the god of wisdom, and the spirit of the universe. His blue cloak flecked with grey symbolised the sky. He was also venerated as the father of the slain, the Einherjar, whom he gathered with him in Valhalla in preparation for Ragnarok, the final battle on the Vigrid Plain when nearly all would die in the struggle between the gods and the frost giants. He himself would be killed by the wolf, Fenrir, the offspring of the fire god, Loki, and the giant frost goddess, Angrboda.

He was traditionally one-eyed and was also the inspiration of the berserkers, the frenzied and fearsome warriors who fought naked and fathered the English phrase "to go berserk".

Ragnarok. The apocalyptic doom of the gods, when Fenrir (*q.v.*) will eat the sun and moon and a monstrous anarchy will be set loose on the world. The inhabitants of the underworld will rise, the Midgard serpent (*q.v.*) will rise from the sea and flood the earth, the Æsir (*q.v.*) will fight a final battle: Odin (*q.v.*) against Fenrir, Thor (*q.v.*) against the Midgard serpent, Freyr (*q.v.*) against Surt (*q.v.*), Tyr (*q.v.*) against Garm (*q.v.*), Heimdall (*q.v.*) against Loki (*q.v.*). Of these combatants only the fire-god Surt will survive and he will engulf the world in flames, killing everyone. However, the earth will rise again, be repopulated by those who had hidden inside Yggdrasil (*q.v.*), and Baldr (*q.v.*) will return from the dead to rule the sons of the gods.

Ran. Goddess of the sea and wife of Ægir (*q.v.*).

Regin. Fafnir's (*q.v.*) duplicitous brother. He betrayed Fafnir with Sigurd (*q.v.*) to obtain his hoard of gold. He also intended to trick Sigurd out of his share, but was killed by him instead.

Siegfried. *See* **Sigurd**.

Siegmund. *See* **Sigmund**.

Sif. The wife of Thor (*q.v.*), notable for her golden hair.

Sigmund. Germanic hero of *Volsunga Saga* (*q.v.*) and father of Sigurd (*q.v.*). In *Beowulf* (*q.v.*) it is he, not his son, who kills the dragon Fafnir (*q.v.*). He corresponds to Siegmund in the *Nibelungenlied* (*q.v.*).

Sigtyr. God of victory, a title for Odin (*q.v.*).

Sigurd. One of the heroes of *Volsunga Saga* (*q.v.*). The posthumous son of Sigmund (*q.v.*) and slayer of the dragon Fafnir (*q.v.*). He is known as Siegfried in the *Nibelungenlied* (*q.v.*). *See also* **Brynhild** and **Gudrun**.

Sigyn. The wife of Loki (*q.v.*). She attempted to catch the poison dripped over Loki as a punishment for his involvement in the death of Baldr (*q.v.*).

Skadi. Giantess, daughter of Thjazi (*q.v.*) and the wife of Njord (*q.v.*).

Skuld. One of the Norns (*q.v.*).

Sleipnir. Odin's (*q.v.*) great eight-legged stallion—the offspring of Loki (*q.v.*)—used by his son Hermod to rescue Baldr (*q.v.*) from Hel (*q.v.*).

Surt. The giant fire-god of Muspellsheim (*q.v.*), who will destroy the earth at Ragnarok (*q.v.*).

Suttung. The son of Gilling and sometime owner of the Mead-of-Inspiration (*q.v.*).

Thjazi. A giant who obtained the Apples of Youth (*q.v.*). When Loki (*q.v.*) recaptured them for the Æsir (*q.v.*), Thjazi pursued him in the form of an eagle. However, the Æsir singed his wings and easily killed him.

Thor. The son of Fjorgyn (*q.v.*) and the champion of the Æsir (*q.v.*). He wore iron gloves and wielded the terrible hammer Mjollnir (*q.v.*) in the defence of Asgard (*q.v.*). Thor was often associated with thunder and violence, being a highly irascible god; however, he also appears in a number of comic stories. He will confront the Midgard serpent (*q.v.*) at Ragnarok (*q.v.*).

Thunor. The Anglo-Saxon god of thunder, often associated with oak trees.

Tyr. A Norse god, equivalent to the Germanic Tîwaz (*see* **Odin**). The brave and wise god of war, he captured Fenrir (*q.v.*), but sacrificed one of his hands to secure the wolf. The boldest of the gods, according to Snorri Sturluson.

Ull. One of the Æsir (*q.v.*), associated with archery and skiing.

Urd. One of the Norns (*q.v.*).

Utgarthar-Loki. Giant and opponent of Thor (*q.v.*) who challenged him to a series of tests and won by means of misleading magic.

Valhalla. The great hall of battle-dead heroes presided over by Odin (*q.v.*). The inhabitants feast all night on pork and mead, milked from the goat Heidrun which lived on the roof of the hall.

Vali. Odin's (*q.v.*) son by Rind. He will survive Ragnarok (*q.v.*).

Valkyries. Terrible figures associated with bloody battles and death, sometimes seen as riding wolves and stalking battlefields. The Valkyries often represented Fate—their name means "Choosers of the Slain". They included Brynhild (*q.v.*), Hild, Hlok, Gud and Herfjotur.

Vanir. The race of Njord (*q.v.*), Freyr (*q.v.*) and Freyja (*q.v.*), a group of gods particularly associated with fertility. They were often in opposition to the Æsir (*q.v.*).

Verdandi. One of the Norns (*q.v.*).

Volsung. Founder of the Volsungs, the family of Sigmund (*q.v.*) and Sigurd (*q.v.*).

Volsunga Saga. Icelandic prose account of the Volsungs, including the heroes Sigmund (*q.v.*) and Sigurd (*q.v.*). Analogous with the German *Nibelungenlied* (*q.v.*).

Voluspá. Icelandic poem telling of the creation and destruction of the world.

Wayland (**Weland**). The Anglo-Saxon smith of the gods, known as Volund (*q.v.*) in Icelandic and the equivalent of the Roman Vulcan.

Woden (**Wodan, Wotan**). "Master of Fury", an Anglo-Saxon analogue of the Norse god Odin (*q.v.*). Woden was seen as the leader of sky warriors, a master of the powers of darkness and death and a god of variable favour. Also known by many other names in Norse myth.

Wyrd. The Anglo-Saxon Fate, equivalent to the

Norse Urd (*q.v.*). Wyrd was an arbitrary, inexorable and at times malevolent force presiding over all men's destinies. A key concept in Old English heroic verse.

Yggdrasil. The great ash tree, central to the world. Its tree roots went into Asgard (*q.v.*), Iotunheim (*q.v.*) and Niflheim (*q.v.*). Its boughs encompassed heaven and earth. At its foot was the Well of Urd (*q.v.*) and beneath its roots were the Spring of Mimir (*q.v.*) and Hvergelmire, the source of all rivers. After Ragnarok (*q.v.*), the new world will be created by those who had sheltered inside Yggdrasil.

Ymir. An ice giant, the result of the contact between the fire of Muspellsheim (*q.v.*) and the ice of Niflheim (*q.v.*). From Ymir came the first man and woman and the Frost Giants (*q.v.*). He was killed by the Æsir (*q.v.*).

IDEAS & BELIEFS

This section explains many of the ideas and beliefs that dominated our history during the centuries. The arrangement is alphabetical and the subjects covered range from a world-wide spectrum of religious and philosophical terms to the major political controversies and ethical debates which have helped to shape contemporary thought.

IDEAS AND BELIEFS

This section explains many of the ideas and beliefs which people have held at different periods in history. Beliefs may be true or false, meaningful or totally meaningless, regardless of the degree of conviction with which they are held Since man has been moved to action so often by his beliefs they are worth serious study. The section throws a vivid light on human history.

Humans have has always felt a deep need for emotional security, a sense of "belonging". This need has found expression in the framing of innumerable religious systems, nearly all of which have been concerned with man's relation to a divine ruling power. There is also to be found in man an irresistible curiosity which demands an explanation of the world in which he finds himself. This urge to make the world intelligible takes him into the realm of science where the unknown is the constant challenge. Science is a creative process, always in the making, since the scientist's conjectures are constantly being submitted to severe critical tests. Basic scientific ideas are discussed in **Section T**.

A

Abortion is the ending of the life of a foetus after conception and before birth. Is this ever morally right? After 1967 there was a liberalization of abortion laws throughout Europe, but opponents have not given up the argument, making abortion a bitter ethical issue. The Roman Catholic church in particular is strongly opposed to it. Defenders of abortion argue that an embryo is very different from us and that there is little difference between an early abortion and contraception. Opponents focus on the later stages of pregnancy. They talk of 'the unborn child' and claim that abortion is the deliberate killing of an innocent human being and in the same category as murder. So the debate is often about drawing the line as to where one becomes a human being or person. The debate is particularly acrimonious in the USA.

The 1967 Abortion Act (in the UK) legalised abortion until 28 weeks. The 1990 Human Fertilisation and Embryo Act reduced this time limit to 24 weeks. In 2015 the Irish Republic voted to legalise abortion in a referendum (but Northern Ireland still lags behind).

Activists, those in a political movement who insist on taking active steps towards their objectives rather than merely putting forward a programme. Lately activism has become an increasingly common facet of political life. This is probably because the undeniably rapid social changes which are taking place across the world at the moment are not generally being followed by appropriate shifts in political structures and ideals.

Acupuncture, a unique medical system originating in China and based on the established therapeutic effects of implanting fine gold needles in specific parts of the body. The site of needle implantation is decided according to traditional texts. The apparent lack of any logical relationship between the implantation sites and any known physiological or anatomical systems within the body once caused acupuncture to be held in low regard by Western medicine. Indeed it was certainly true that acupuncture and other similar practices tended to flourish in parts of the world where orthodox medicine has made little progress or where doctors and trained staff are scarce.

Recent years however have seen a curious and unexpected revival of interest in acupuncture in Europe and America. Chinese medicine has now used acupuncture for over 2000 years.

In Britain there is now a growing number of acupuncturists registered with the British Acupuncture Council. Increasingly the British Medical Association (BMA) is endorsing acupuncture as studies show its beneficial effects are similar to Western medicines.

Adlerian Psychology. In 1911 the Viennese psychoanalyst Alfred Adler (1870–1937) together with his colleague Carl Gustav Jung broke with their friend Sigmund Freud over disputes concerning the latter's theoretic approach to psychoanalysis. Jung and Adler were themselves shortly also to part company, each to set up and develop his own "school".

Adler's system of psychotherapy is based on the idea, not of sex as a driving force as in the case of Freud, but on the concept of "compensation" or a drive for power in an attempt to overcome the "inferioritycomplex" which he held to be universal inhuman beings. The child naturally feels inferior to adults, but bullying, making him feel insignificant or guilty or contemptible, even spoiling, which makes him feel important within the family but relatively unimportant outside, increases this feeling. Or the child may have physical defects: he may be small or underweight, have to wear glasses, become lame, be constantly ill, or stupid at school. In these ways he develops a sense of inferiority which for the rest of his life he develops a technique to overcome.

This may be done in several ways: he may try to become capable in the very respects in which he feels incompetent—hence many great orators have originally had speech defects; many painters poor eyesight; many musicians have been partially deaf; like Nietzsche, the weakling, he may write about the superman, or like Sandow, the strong man, be born with poor health.

On the other hand he may overdo his attempt and overcompensate. Hence we have the bully who is really a coward, the small man who is self-assertive to an objectionable degree (Hitler, Napoleon, Stalin, and Mussolini were all small men) or the foreigner who like three of these men wanted to be the hero of his adopted country—Hitler the Austrian, Napoleon the Italian, Stalin the Georgian.

But what about the man who can do none of these things, who continues to fail to compensate? He, says Adler, becomes a neurotic because neurosis is an excuse which means "I could have done so-and-so but . . ." It is the unconscious flight into illness—the desire to be ill. Adler's treatment involves disclosing these subterfuges we play on ourselves so that we can deal with the real situation in a more realistic way.

Adlerian psychoanalysis still attracts supporters, but its golden days were when the founder was at the head of the movement in the USA, when his views were considered to provide a more "acceptable" theory of the mind than the controversial theories of Freud with their strong sexual orientation.

Adventists, a group of American religious sects, the most familiar being the Seventh-Day Adventist Church, which observes Saturday as the true Sabbath. Today, it has more than 6 million members throughout the world. It shares with other Adventists a belief in the imminent second coming of Christ (a doctrine fairly widespread in the USA during the early decades of the 19th cent. when the end of the world was predicted by William Miller for 1843, then for 1844). Modern Adventists content themselves with the conviction that the "signs" of the Advent are multiplying, the "blessed event" which will solve the world's ills. Believers will be saved, but the sects differ as to whether the unjust will be tortured in hell, annihilated, or merely remain asleep eternally.

Agnosticism. *See* **God and Man**.

Albigenses, also known as Cathars. French heretical sect (named after the town of Albi in Provence) which appeared in the 11th cent. to challenge the Catholic Church on the way true Christians should lead their lives. They followed a life of extreme asceticism in contrast to the local clergy and their faith was adopted by the mass of the local population, especially in Toulouse. Condemned as heretics by Pope Innocent III, the sect was exterminated in the savage Albigensian Crusade (1208–29), initially led by Simon de Montfort. (In his thoroughness, de Montfort also succeeded in destroying the high culture of the Troubadours.)

Alchemy, ancient art associated with magic and astrology in which modern chemistry has its roots. The earliest mention of alchemy comes from ancient Egypt but its later practitioners attributed its origins to such varied sources as the fallen angels of the Bible, to Moses and Aaron, but most commonly to Hermes Trismegistus, often identified with the Egyptian god Thoth, whose knowledge of the divine art was handed down only to the sons of kings (*cf.* the phrase "hermetically sealed").

Its object was the transmutation of metals. Egyptian speculation over this reached its height during the 6th cent. in the Alexandrian period. Brought to Western Europe by the Muslims, one of its most famous Arab exponents was Jabir (*c.* 760–*c.* 815), known to the Latins as Geber, who had a laboratory at Kufa on the Tigris. One school of early Greek philosophy held that there was ultimately only one elemental matter of which everything was composed. Such men as Albertus Magnus (1206–80) and Roger Bacon (1214–94) assumed that, by removing impurities, this *materia prima* could be obtained. Although Bacon's ideas were ahead of his time, he firmly believed in the philosopher's stone, which could turn base metals into gold, and in an elixir of life which would give eternal youth.

Alternative Medicine includes treatments such as acupuncture (**J2**), homoeopathy (*see* **J26**), reflexology, chiropractic, aromatherapy and yoga. A Natural Healthcare Council has been established to regulate complementary therapies for the first time. Since 2011, all herbal medicines sold over the counter must be approved and registered.

Amish. *See* **Mennonites.**

Anabaptists. *See* **Baptists.**

Analytical Psychology, the name given by Carl Gustav Jung (1875–1961) of Zürich to his system of psychology, which, like Adler's (*see* **Adlerian Psychology**), took its origin from Freud's psychoanalysis from which both diverged in 1911. Briefly, Jung differed from Freud: (1) in believing that the latter had laid too much emphasis on the sexual drive as the basic one in man and replacing it with the concept of *libido* or life energy of which sex forms a part; (2) in his theory of types: men are either extrovert or introvert (*i.e.* their interest is turned primarily outwards to the world or inwards to the self), and they apprehend experience in four main ways, one or other of which is predominant in any given individual—sensing, feeling, thinking, or intuiting; (3) in his belief that the individual's unconscious mind contains not only repressed materials which, as Freud maintained, were too unpleasant to be allowed into awareness, but also faculties which had not been allowed to develop—*e.g.*, the emotional side of the too rational man, the feminine side of the too masculine one; (4) in the importance he attaches to the existence of a collective unconscious at a still deeper level which contains traces of ancient ways of thought which mankind has inherited over time.

These are the *archetypes* and include primitive notions of magic, spirits and witches, birth and death, gods, virgin mothers, resurrection, *etc.* In the treatment of the neuroses Jung believed in the importance of (*a*) the present situation which the patient refuses to face; (*b*) the bringing together of conscious and unconscious and integrating them.

In the 1940s and 1950s interest in Jung's ideas waned, at least in academic circles, as the emphasis among experimental psychologists shifted closer and closer to the "hard" scientific line. This was also true in the field of psychoanalysis where the Jungian as opposed to the Freudian point of view became progressively less popular. At the present time this trend is beginning to reverse, and while Jung's offbeat views on astrology, telepathy, *etc.*, are still unfashionable, a reappraisal of the significance of his views on the nature of the unconscious is taking place and many psychologists feel that his contribution to our understanding of the nature of human mental processes has been greatly underrated.

Anarchism, a political philosophy which holds, in the words of the American anarchist Josiah Warren (1798–1874), an early follower of Robert Owen, that "every man should be his own government, his own law, his own church."

The idea that government interference or even the mere existence of authority is inherently bad is as old as Zeno, the Greek Stoic philosopher, who believed that compulsion perverts the normal nature of man. William Godwin's *Enquiry Concerning Political Justice* (1793) was the first systematic exposition of the doctrine. Godwin (father-in-law of Shelley) claimed that man is by nature sociable, co-operative, rational, and good when given the choice to act freely; that under such conditions men will form voluntary groups to work in complete social harmony.

Such groups or communities would be based on equality of income, no state control, and no property: this state of affairs would be brought about by rational discussion and persuasion rather than by revolution.

Proudhon. The French economist Proudhon (1809–65) was the first to bring anarchism to the status of a mass movement. In his book *What is Property?* he stated bluntly that "property is theft" and "governments are the scourge of God". He urged the formation of co-operative credit banks where money could be had without interest and goods would be exchanged at cost value at a rate representing the hours of work needed to produce each commodity. Like Godwin, he disapproved of violence but, unlike Marx, disapproved of trade unions as representing organised groups.

Bakunin and Kropotkin. In communistic anarchism these ideas were combined with a revolutionary philosophy, primarily by the Russians Michael Bakunin (1814–76) and Peter Kropotkin (1842–1921) who favoured training workers in the technique of "direct action" to overthrow the state by all possible means, including political assassination. In 1868 anarchists joined the First International which broke up a few years later after a bitter struggle between Bakuninists and Marxists. Subsequently small anarchist groups murdered numerous political figures.

Anarchism and communism differ in three main ways: (1) anarchism forms no political party, rejects all relationship with established authority, and regards democratic reform as a setback; (2) communism is against capitalism, anarchism against the state as such; (3) both have the final goal of a classless society, but anarchism rejects the idea of an intermediate period of socialist state control accepted by communism. Philosophical anarchists, such as the American writer Henry David Thoreau (1817–62), were primarily individualists who believed in a return to nature, the non-payment of taxes, and passive resistance to state control; Thoreau thus strongly influenced Gandhi as did the Christian anarchist Tolstoy.

Spain. Although active in the 1917 Russian Revolution, where it opposed Bolshevik dictatorship, anarchism has had only limited political influence. Its most notable achievement was in the anarcho-syndicalist trade union, the CNT, which had mass support in parts of Spain and which developed agricultural and industrial workers' control in the early stages of the 1936–9 civil war. There was a revival in the 1960s student movement, particularly in the 1968 French events, and the anti-capitalist and anti-globalisation movement of recent years has shown renewed interest. *See also* **Syndicalism**.

Anglicanism. *See* **Church of England**.

Anglo-Catholicism. To Queen Elizabeth I the Church of England was that of the "middle way" in which human reason and commonsense took their place beside Scripture and Church authority. The extent to which these various factors are stressed creates the distinctions between "high" and "low" church.

Anglo-Catholics tend to reject the term "Protestant" and to stress the term "Catholic" and, although few accept the infallibility of the Pope some Anglo-Catholic churches have introduced much or all of the Roman ritual and teach Roman dogmas. The ordination in March 1994 of the first women priests to the Anglican ministry caused over 200 former Anglican clergy (many of them married) to be received into the Catholic Church. *See* **Catholicism, Tractarianism**.

Animal Rights. *See* **Anti-vivisection (J5)**.

Animism. To early man and in less developed societies the distinction between animate and inanimate objects was not always obvious—it is not enough to say that living things move and non-living things do not, for leaves blow about in the wind and streams flow down a hillside. In the religions of early societies, therefore, we find a tendency to believe that life exists in all objects from rocks and pools to seas and mountains. This belief is technically known as *animatism*, which differs from *animism*, a somewhat more sophisticated view which holds that natural objects have no life in themselves but may be the abode of dead people, spirits, or gods who occasionally give them the appearance of life.

The classic example of this, of course, is the idea that an erupting volcano is an expression of anger on the part of the god who resides in it.

Anthropomorphism, the attribution of human form, thoughts or motives to non-human entities or life forms from gods to animals. At one end this can be summed up in the once widespread image of God as a "white-bearded old gentleman sitting on a cloud." At the other end is the very common tendency to invest domestic animals and pets with man-like wishes and personalities. At both extremes the belief could be seriously misleading. Firstly, it could be very unwise to assume that God, if he exists, necessarily thinks as humans do and has human interests at heart. Secondly, we shall learn very little about animal behaviour if we look upon them as mere extensions of our own personality, and we do them less than justice if we see them simply as human beings of diminutive intelligence.

Anthroposophy, a school of religious and philosophical thought based on the work of the German educationist and mystic Rudolf Steiner (1861–1925). Steiner was originally an adherent of Madame Blavatsky's theosophical movement (*cf* Theosophy) but in 1913 broke away to form his own splinter group, the Anthroposophical Society. Steiner was much influenced by the German poet and scientist, Goethe, and believed that an appreciation and love for art was one of the keys to spiritual development. One of the first tasks of his new movement was the construction of a vast temple of arts and sciences, known as the Goetheanum, to act as the headquarters of the society. This structure, which was of striking and revolutionary architectural style, was unfortunately burnt down in 1922 to be replaced by an even more imaginative one which today is one of the most interesting buildings of its kind in the world.

Anthroposophy, which continued to expand following its founder's death, is well-established in various parts of the world with specialised, and often very well equipped, schools and clinics which propagate the educational and therapeutic theories of the movement. These, which include the allegedly beneficial powers of music, coloured lights, *etc.*, have made an increasing impact on modern educational ideas, but the schools have acquired a reputation for success in the training of mentally handicapped children. Today there are more than 750 Steiner schools worldwide, many clinics and homes for the handicapped, adult education centres, an international management consultancy, and several hundred thousand acres under biodynamic cultivation without the use of chemical pesticides, herbicides, or fertilizers. Interesting work continues to be done, in pharmacology, botany, mathematics and physics, and architecture.

New banking systems, operating rather like credit unions, have arisen (Mercury in Britain, Prometheus in New Zealand).

Anticlericalism, resentment of priestly powers and privileges, traceable in England to Wyclif's insistence in the 14th cent. on the right of all men to have access to the Scriptures. The translation of the Bible into the common tongue was a great landmark in the history of the Bible and the English language. Wyclif's principles were condemned by the Roman Church of his time but were readily accepted during the Reformation. Tudor anticlericalism arose from motives ranging from a greedy desire to plunder the riches of the Church to a genuine dislike of the powers of the priesthood whose spiritual courts still had the right to decide on points of doctrine or morals in an age when the layman felt he was well able to decide for himself. In innumerable ways the Church was permitted to extort money from the laity. It is generally agreed that the final submission of church to state in England was motivated quite as much by anticlericalism as by Protestantism.

The rise of the Reformed churches in England satisfied the people generally and anticlericalism never became the fixed principle of permanent parties as happened in France and Italy.

Antiglobalisation is either scepticism of the existence of globalisation (*q.v.*), or opposition to globalisation. Scepticism of globalisation rejects the view that globalisation is new and intrinsically different, and points to the long history of global trade, exchange of ideas and culture, and international treaties and laws. Such sceptics also point to the continued importance of nation states as many groups continue to strive for nationhood, and global free trade struggles with national protected markets and economic subsidies. Opponents regard globalisation as a cloak for the expansion of western, and particularly American economic, political and social power. Some opponents promote an alternative form of globalisation where solidarity and cooperation defeat private capital and western strategic interests. Such has been the motivation of the anti-globalisation protests in London, Seattle and Genoa in recent years.

Antisemitism, a term which gained currency about the middle of the 19th century to those who were anti-Jewish in their outlook. Although this attitude was prevalent for religious reasons throughout the Middle Ages, modern antisemitism differed (*a*) in being largely motivated by economic or political conditions, and (*b*) in being doctrinaire with a pseudo-scientific rationale presented by such men as Gobineau (1816 82) and Houston Stewart Chamberlain (1855–1927), and later by the Nazi and Fascist "philosophers".

It was evident in Russia and Hungary with the pogroms of 1882.It was later to spread south and westwards where, in France, the Dreyfus case provided an unsavoury example in 1894. Thousands of Jews from Eastern Europe fled to Britain and America during this period; for in these countries antisemitism has rarely been more than a personal eccentricity. During the Second World War the murder of six million Jews by the Nazis and their accomplices led to a further exodus to various parts of the world and finally to the creation of the state of Israel.

But there are social causes too and politicians in some lands are well versed in the technique of blaming unsatisfactory conditions (which they themselves may have in part produced) upon minority groups and persuading others to do the same. Historically, the Jew was ideally suited for this role of scapegoat; (1) in the Middle Ages when usury was forbidden to Christians but not to Jews, the latter often became moneylenders incurring the opprobrium generally associated with this trade; (2) many trades being closed to Jews, it was natural that they concentrated in others, thus arousing suspicions of "influence" (*i.e.* Jews are felt to occupy a place in certain trades and professions which far exceeds their numerical proportion to the population as a whole); (3) even with the ending of ghetto life, Jews often occupy *en masse* some parts of cities rather than others and this may lead to resentment on the part of the original inhabitants who begin to feel themselves dispossessed; (4) Jews tend to form a closed society and incur the suspicions attached to all closed societies within which social contacts are largely limited to members; marriage outside the group is forbidden or strongly disapproved of, and the preservation, among the orthodox, of cultural and religious barriers tends to isolate them from their fellow citizens. After 1990, with the political changes in Russia and Eastern Europe, neo-fascists began a resurgence of anti-semitism. Acts of anti-semitism continued to rise after the economic crisis of 2007. Anti-semitism in Europe has now reached its highest level in decades.

Anti-Slavery International, the world's oldest human rights organisation (founded in 1839). It is the successor to the British and Foreign Anti-Slavery Society. Slavery was abolished in the British Empire in 1839. There are even today an estimated 40 million people living in slavery, in countries such as Mauritania, India, Pakistan, Haiti, Benin *etc.*, according to the 2016 Global Slavery Index. Slavery includes debt bondage, forced marriage, human trafficking and child exploitation. A Moden Slavery Act was passed in 2015 which established the first anti-slavery commissioner.

Anti-vivisection, opposition to scientific experimentation upon live animals based, according to its supporters, both on the moral grounds of the suffering imposed, and also on the grounds that many doctors and scientists of repute have rejected the value of information gained in this way. It is true that the protagonists of the movement during its early days in the mid-19th cent. included a number of eminent physicians and surgeons. Many people today remain deeply concerned about the moral problems of vivisection, even though without animal experiments we would be unable to test out new drugs for safety before using them on human beings. There are in Britain many active anti-vivisection societies. Much of their work is co-ordinated through the British Council of Anti-Vivisection Societies. In Britain, experiments on live animals are covered by the 1986 Animals (Scientific Procedures) Act. Worldwide over 200 million animals are killed in experiments each year.

Many people would like the number of experiments on animals reduced and the law changed to prohibit any experiments in which there is any risk of inflicting suffering. Recent years have seen an upsurge in support for such organisations. The 2006 Animal Welfare Act set out the needs of a pet to protect its physical and mental health.

Recent years have also seen moves to outlaw the use of wild animals in circuses, to reduce the use of animals to test cosmetic products and to insist animals killed in abattoirs are first stunned.

Apartheid. An Afrikaans word meaning "apartness", which refers to the policy of total racial discrimination between black and white South Africans as enforced by successive governments of that country from 1948 until the early 1990s when the system was dismantled. At its height, apartheid was an inhuman system which denied even the most basic human rights to the Africans.

In January 2000 a far-reaching Equality Bill was introduced in South Africa which sought finally to end the legacy of apartheid.

Arianism, formed the subject of the first great controversy within the Christian Church over the doctrine of Arius of Alexandria (d. 336) who denied the divinity of Christ. The doctrine, although at first influential, was condemned at the Council of Nicaea (325), called by the Emperor Constantine, at which Arius was opposed by Athanasius, also of Alexandria, who argued the now orthodox view that the Son is of one substance with the Father.

Arius was banished but the heresy persisted until the 7th cent., especially among the barbarians, the Goths, Vandals and Lombards. Disbelief in the divinity of Christ has formed part of the doctrine of many sects since (*e.g.*) **Unitarianism** (*q.v.*).

Arminianism. A theological movement in Christianity, based on the teachings of the Dutch theologian Jacob Harmensen (or Hermansz) (1560–1609), whose name was Latinised as Jacobus Arminius. He reacted against the Calvinist doctrine of predestination. His followers formulated his three main beliefs as: divine sovereignty was compatible with real freewill in man; Christ died for all men (and not only the elect); and all who believe in him can be saved. Arminianism had an important influence on John Wesley and through him on Methodism.

Asceticism. The practice of self-discipline of both mind and body in order to achieve a spiritual ideal or goal. From the Greek *askein*, to practise or exercise. The term originally referred to the training carried out by athletes. The concept was then transformed into the idea of training for wisdom. This view is clearly articulated in Plato, who argued that one must free oneself from the desires of the body in order to achieve full spiritual insight. Since all religions exalt the soul over the body, the spiritual over the material, and eternal life over this world, they all have traces of asceticism. In many of them, there are adherents who have gone beyond self-denial to self-punishment. Important features of ascetic movements are celibacy, abdication of worldly possessions, abstinence and fasting.

Ascetism has been very important in Christianity, most notably in the monastic movement (*see* **Monasticism**), though practices varied widely among monks, from the extravagant austerity of Egyptian hermits to the work-oriented community life of the Benedictines. Since the rise of Protestantism, however, extreme austerity has been less favoured. Hinduism also has a strong tradition of asceticism, and there are elements in Buddhism and Islam.

Assassins, a sect of Muslim Shi'ites, founded by the Persian Hasan i Sabbah (*c.* 1090), which for more than two centuries established a rule of terror all over Persia and Syria. The coming of the Mongols in 1256 destroyed them in Persia and the Syrian branch suffered a similar fate at the hands of the then Mamluk sultan of Egypt, *c.* 1270. It was a secret order, ruled over by a grand master, under whom the members were strictly organised into classes, according to the degree of initiation into the secrets of the order.

The devotees, belonging to one of the lower groups, carried out the actual assassinations under strict laws of obedience, and total ignorance of the objects and ritual of the society. It is believed that these devotees were given ecstatic visions under the influence of hashish, whence the term *hashshashin*, corrupted to "assassin".

Assisted Dying. *See* **Euthanasia.**

Associationism. In psychology, the Associationist school of the 19th cent. accepted the association of ideas as the fundamental principle in mental life. It was represented in Britain by the two Mills and Herbert Spencer, in Germany by J. F. Herbart (1776–1841). To these, mental activity was nothing but the association of "ideas" conceived of as units of both thought and feeling—the emotion of anger or the perception of a chair were both "ideas"—and apart from them the self did not exist. Personality was simply a series of these units coming and going, adding to or cancelling each other out, in accordance with rigid scientific laws.

Astrology was once the best available theory for explaining the course of human life and bears much the same historical relationship to astronomy as alchemy does to chemistry.

Originally it was divided into two branches: (1) **Natural Astrology** which dealt with the movements of the heavenly bodies and their calculations, and (2) **Judicial Astrology** which studied the alleged influence of the stars and the planets on human life and fate. It was the former that developed into modern astronomy; the latter was, and remains, a myth.

Astrology owes most to the early Babylonians (or Chaldeans) who readily accepted the idea that divine energy is manifested in the movements of the sun and planets. Gradually this concept became enlarged and the relative positions of the planets both in relation to each other and to the fixed stars became important together with the idea of omens—that, if a particular event occurred whilst the planets were in a particular position, the recurrence of that position heralded a recurrence of the same sort of event.

The planets became linked with almost every aspect of human life. They were bound up with the emotions, with parts of the body, so that astrology played quite a large part in medicine up to late medieval times. Not only was the position of the planet to be considered but also the particular sign of the zodiac (or house of heaven) it was occupying, and it was believed possible to foretell the destiny of an individual by calculating which star was in the ascendant (*i.e.* the sign of the zodiac nearest the eastern horizon and the star which arose at that precise moment) at the time of his birth.

Astrology was popular among the Egyptians, the Romans (whose authorities found the

Chaldean astrologers a nuisance and expelled them from time to time), and in the Middle Ages.

Atheism. *See* **God and Man.**

Atlantis, a mythical empire supposed to have lain somewhere between Europe and America and a centre of advanced civilisation before it was inundated by some great natural catastrophe in pre-Christian times. Plato made use of the myth. Some believe the myth was based on the eruption of Santorini, an island in the Eastern Mediterranean.

Atomism. In philosophy, the atomists were a group of early Greek thinkers, the most important of whom were Leucippus (fl. *c.* 440 B.C.) and his younger contemporary Democritus (*c.* 460–370 B.C.). Prior to these men, although it had been agreed that matter must be composed of tiny ultimate particles and that change must be due to the manner in which these mingled or separated from each other, it was supposed that there existed different types of particle for each material—*e.g.* for flesh, wood, hair, bone. The atomists taught that atoms were all made of a single substance and differed only in the connections (pictured as hooks, grooves, points, *etc.*) which enabled them to join each other in characteristic ways. Theirs was the first move towards modern atomic theory and a predecessor of the modern concept of chemical linkages.

Authoritarianism, a dictatorial form of government as contrasted with a democratic one based on popular sovereignty.

Automatism, the production of material, written or spoken in "automatic" fashion—*i.e.*, apparently not under the conscious or volitional control of the individual. This psychologically perplexing phenomenon has occurred from time to time throughout the history of literature and art, and while it has occasionally produced work of great merit (much of William Blake's poetry, Coleridge's "Kubla Khan", *etc.*) the bulk of it is indifferent and often simply rubbish. Spiritualists claim that the work is produced under the direct guidances of the spirit world, and their argument once attracted considerable attention through the compositions of the pianist Rosemary Brown who, with little or no academic background in musical theory, produced a number of "original" piano pieces allegedly composed by Beethoven, Mozart, *etc.*, from the astral plane. While few music critics denied Mrs. Brown's honesty and integrity, most consider her work to be clever pastiche and barely comparable in quality to the masterworks of the dead composers.

Nevertheless automatism wants some explaining, and most psychologists today defer judgement, taking the view that it serves to remind us of the fund of material which lies in the unconscious mind, and which is prone to pop up from time to time without warning.

Ayurveda (Sanskrit, the Science of Life), a philosophy based on divine Hindu writings, which seeks to prolong both physical and spiritual life and health.

B

Baconian Method, the use of the inductive (as opposed to the deductive or Aristotelian) method of reasoning as proposed by Francis Bacon in the 17th cent. and J. S. Mill in the 19th cent. Deduction argues from supposedly certain first principles (such as the existence of God or Descartes's "I think, therefore I am") what the nature of the universe and its laws *must* be, whereas the only means of obtaining true knowledge of the universe, in Bacon's view, was by the amassing of facts and observations so that when enough were obtained the certain truth would be known in the same way that a child's numbered dots in a playbook joined together by a pencilled line create a picture. However, this is not the way science progresses in practice. Bacon had underrated the importance of hypothesis and theory and overrated the reliability of the senses. In discussing the scientific tradition, Sir Karl Popper in his book, *Conjecture and Refutations*, says: "The most important function of observation and reasoning, and even of intuition and imagination, is to help us in the critical examination of those bold conjectures which are the means by which we probe into the unknown." Two of the greatest men who clearly saw that there was no such thing as an inductive procedure were Galileo and Einstein.

Bahá'i Faith. Although its origins lie within Islam, the Baha'i movement today considers itself to be the fourth branch of the Western Monotheistic Tradition. Believing that God's revelation to mankind did not end with the Prophet Muhammad, Baha'is revere two further figures, Bab and Baha'u'lla. It was begun in 1844 by a Persian Muslim, Mirza Ali Muhammad, who pronounced himself to be Bab, 'The Gate', who would be a forerunner for a greater prophet. Upon his execution in 1850, one of his closest followers Mirza Husayn-Ali Nuri, also known as Baha'u'lla, 'The Glory of God' took over the community and in 1863 announced that he was the promised one. Baha'is revere the holy writings of both figures and believe them to be the first-hand writings of God's own messengers.

The fundamental beliefs of the faith relate to God sending a messenger in every generation to bring together the teachings of those who have gone before. It prides itself in inclusion, having no priesthood or liturgy and a structure based on gender and race equality as well as absolute democracy.

Although at times plagued by internal disputes, it claims that the message of Baha'u'lla is for the whole of mankind. An emphasis is placed on the education of all, traditional family values and healthy living, including the recommendation of vegetarianism.

The Baha'i faith has suffered repeated severe persecution in Iran (the country of its birth) since the 1979 revolution (over 200 have been executed, hundreds more imprisoned). They are most numerous in India (1·8 million).

Baptists, a Christian denomination whose distinctive doctrines are that members can only be received by baptism "upon the confession of their faith and sins" and that "baptism is no wise appertaineth to infants." Baptism is therefore by total immersion of adults. Modern Baptists base their doctrines upon the teaching of the Apostles and some hold that the Albigenses (*q.v.*) maintained the true belief through what they regarded as the corruption of the Roman Church in medieval times. On the other hand any connection with the Anabaptist movement during the Reformation is rejected and the beginning of the modern Church is traced to John Smyth, a minister of the Church of England who in Amsterdam was influenced by the Arminians (*q.v.*) and Mennonites. Smyth died in 1612 when the first Baptist church in England was built at Newgate.

This, the "General" Baptist Church, rejected Calvinistic beliefs and held the Arminian doctrine of redemption open to all, but some years later a split occurred with the formation of the "Particular" Baptist Church which was Calvinist in doctrine. In 1891 the two bodies were united in the Baptist Union and today the sect is spread throughout the world, notably in the United States. There are less than 150,000 Baptists in Great Britain.

Anabaptism. This movement began in Zurich, Switzerland, in 1525, when Conrad Grebel, Felix Manz and Jörg Blaurock, their hearts moved by their failure to live according to the Gospel, decided to give their lives to following Christ's teaching, whatever the cost. The movement spread widely in Switzerland, Germany and Holland in the 16th century, and its followers suffered martyrdom by fire, water and the sword for the sake of their faith. They met with further condemnation and persecution because of the excesses of a violent and radical group, known as the Münster Anabaptists, whom they disowned.

The wider movement was non-violent and stood for baptism on confession of faith, love to one's enemies and obedience to the Spirit of Christ's Sermon on the Mount. This movement is the spiritual precursor of several of the Peace Churches of today: the Hutterians (named after their founder, Jakob Hutter), the Mennonites (after Menno Simons), and, later, the Amish.

The most radical of these groups is that of the Hutterian Brethren, who live, work, and hold their goods in common like the first Christians.

Beat Generation, a term first used by the American writer Jack Kerouac (1922–69), author of *The Town and the City* and *On the Road*, to define various groups spread across the face of the country, but notably in New York and San Francisco, who, belonging to the post-war generation, represented various rebellious attitudes to authority.

Behaviourism, a school of psychology founded in 1914 by J. B. Watson (1878–1958), an animal psychologist at Johns Hopkins University, Baltimore. Its main tenet was that the method of introspection and the study of mental states were unscientific and should be replaced by the study of behaviour. When animals or human beings were exposed to specific stimuli and their responses objectively recorded, or when the development of a child, as seen in its changing behaviour, was noted, these alone were methods which were truly scientific. Watson contributed an important idea to psychology and did a great deal towards ridding it of the largely philosophical speculations of the past. But he also went to absurd extremes, as in his view that thought is nothing but subvocal speech, consisting of almost imperceptible movements of the tongue, throat, and larynx (*i.e.*, when we think, we are really talking to ourselves), and his further opinion that heredity is, except in grossly abnormal cases, of no importance. He claimed that by "conditioning", the ordinary individual could be made into any desired type, regardless of his or her inheritance.

Pavlov. The work of Ivan Pavlov began about 1901, but was unknown in America until about ten years later, and it was through another Russian, Vladimir Bekhterev, that the concept of "conditioning" was introduced into the country. Bekhterev's book *Objective Psychology*, describing his new science of "reflexology". was translated in 1913 and played a great part in the development of Behaviourist ideas.

The conditioned reflex became central to Watson's theory of learning and habit, formation (*e.g.*, he showed that a year-old child, at first unafraid of white rats, became afraid of them when they came to be associated with a loud noise behind the head).

Finally all behaviour, including abnormal behaviour, came to be explained in terms of conditioned responses; these were built up by association on the infant's three innate emotions of fear, rage, and love, of which the original stimuli were, for the first, loud noises and the fear of falling; for the second, interference with freedom of movement; and for the third, patting and stroking.

Because of its considerable theoretical simplicity and its implicit suggestion that human behaviour could be easily described (and even modified or controlled), Pavlovian psychology appeared very attractive to the Communist regime in Russia, and before long it became the "official" dogma in universities and research laboratories. Whereas in America and Western Europe its severe limitations became gradually apparent, in the former USSR these were ignored or disguised for ideological reasons with the inevitable outcome that Soviet psychology failed to evolve and, at one stage, seemed to be no more than a pallid offshoot of physiology. In non-Communist countries simple Watsonian behaviourism evolved into more sophisticated studies of animal learning, largely pioneered by the Harvard psychologist, Skinner. These techniques, which have shown that animals, from monkeys to rats, may be taught to solve a remarkable range of physical problems (such as pressing complex sequences of buttons or levers to escape from a cage) have themselves turned out to be rather disappointing in terms of advancing our general understanding of the workings of the human and animal brain. There is a growing feeling among psychologists that the real keys to the understanding of mankind will only be found through the study of man himself, and not his simpler animal cousins. *See also* **Gestalt Psychology**.

Benthamism. *See* **Utilitarianism.**

Bermuda Triangle, an area of sea, bounded by Bermuda, Florida and Puerto Rico where unexplained disappearances of aircraft and ships have led to many fanciful theories. Natural phenomena are the most likely explanation.

Bioethics, the application of ethics to such fields as the biological sciences, medicine, healthcare *etc.* as well as the debate on which policies should be approved by government in these areas.

Biopsychology, the study of the biological and physiological bases of behaviours and psychological processes. It is considered to be a branch of neuroscience and includes the study of: the structure and development of the nervous system; the effects of hormones and other chemicals on neural activity; the effects of drugs, surgery and electrical manipulation on the central nervous system; and the genetics and heritability of behavioural traits.

Bolshevism. When the Russian Social Democratic Party at a conference held in London in 1903 split over the issue of radicalism or moderation, it was the radical faction headed by Lenin which polled the majority of votes. The Russian for majority is *bolshinstvo* and for minority *menshinstvo*; hence the radicals became known as Bolsheviks and the moderates as Mensheviks. Bolshevik was sometimes used (wrongly) in a derogatory way to include all communists (after the Bolshevik seizure of power in Russia in October 1917). *See* **Communism, Marxism**.

Brahmanism. A religion of ancient India which evolved out of the Vedas about 1000–800 B.C. and is still powerful today. It provides the orthodox core of traditional Hinduism. Characteristics of the faith were elaborate ceremonies, material offerings, animal sacrifice, a dominant priestly caste (the Brahmins), and a development of the idea of Brahman as the eternal, impersonal Absolute Principle. *See also* **Hinduism.**

Buchmanism. *See* **Moral Re-Armament**.

Buddhism, one of the great Oriental religions. It arose against the background of Brahmanism in north India in the 6th cent. B.C., its founder being the Sākyan prince Siddhattha Gotama, known as the Buddha or "Enlightened One". Distressed by the problem of human suffering from which even death allowed no escape—since Buddha accepted a doctrine of a cycle of lives—he left his palace and his beloved family to become a religious mendicant and ascetic, studying for six years the beliefs of Brahmin hermits and self-torturing recluses. After this long search he sat down under a tree (the Banyan tree, which became known as the Bo-tree or tree of enlightenment because of his enlightenment) and finally came to understand the cause and release from suffering.

The result of his meditations are found in the "four noble truths" which are: (1) that all living is itself suffering; (2) suffering is caused by desire; (3) suffering ceases when desire is eradicated; (4) that it can be destroyed by following the "noble eightfold path" whose steps are: right views; right thought; right speech, plain and truthful; right conduct, including abstinence not only from immorality and the taking of life, whether human or animal; right livelihood, harming no one; right effort, always pressing on; right awareness of the present; and lastly, right meditation. The more man acquires merit by following these rules in his chain of lives, the sooner is *Nirvana* attained; he loses his individuality, not by annihilation, but "as the dewdrop slips into the shining sea," by merging with the universal life.

Buddhism teaches a way of liberation through ethics and meditation. In many Buddhist nations no word exists for the concept of an Almighty God, which was neither affirmed nor denied by Buddha himself but simply ignored. Nor did Buddha claim to be other than a man, although prayers were made to Buddha, ritual developed, sacred relics preserved under stupas, and the belief in a succession of Buddhas introduced; the sacred writings (*Tripitaka*) are divided into three parts; *Suttanta*, *Abhidhamma* and *Vinaya*. *Suttanta* are mostly teachings in everyday language, *Abhidhamma* are teachings using the analytical method and the *Vinaya* is the monastic rule for monks. They were gathered by devotees at various councils—the first held after the death of Buddha at the age of 80, a third at the order of King Asoka in 244 B.C. The founder himself wrote nothing.

Buddhism spread to Sri Lanka, Nepal, Tibet, Mongolia, Indo-China, Myanmar (Burma), Thailand, China, and Japan, although on the whole losing influence in its old stronghold of the Indus Valley in India. In Tibet, Buddhism developed into Lamaism (*q.v.*). In Sri Lanka, Burma, Thailand *etc.*, it persisted in its pure form (the Theravada), while in China and Japan it developed into the Mahayana. Nowadays, there are over 494 million Buddhists world-wide, with over 250,000 in Britain. The greatest number live in China (*c.* 250 million), where there has been a major revival. Buddhism is the state religion in Cambodia. Fragments of the oldest known Buddhist manuscript (the religion's equivalent to the Dead Sea Scrolls) were discovered by the British Library in 1996. The largest Buddhist temple in the world is in Magelang in Java.

In 2013, excavations at the site believed to be the birthplace of Buddha produced evidence dating back to the 6th cent. B.C.

Buddhism is now advocating a more secular version of its religion to adapt to the needs of modern society.

Bushido, the traditional code of honour of the Samurai or Japanese military caste corresponding to the European concept of knighthood and chivalry. Bushido evolved in the 12th cent. Even today it is a potent influence among the upper classes, being based on the principles of simplicity, honesty, courage, and justice.

C

Cabala (**Kabbalah**), originally a collection of Jewish doctrines about the nature of the Universe, supposedly handed down by Moses to the Rabbis, which evolved into a kind of mystical interpretation of the Old Testament. Students of the history of religious belief have found its origins to be in fact extremely obscure, and some aspects appear to have been lifted from ancient Egyptian sources. Skilled Cabalists hold that the system contains a key to biblical interpretation based on the numerical values of the words and letters of the Scriptures which reveal hidden depths of meaning behind the allegorical Old Testament stories. This 'received' teaching is now enjoying a major revival (*e.g.* in the USA).

Caliph, The title of Muslim rulers, successors to Mohammed. In 680 it became hereditary in the Umayyad line until 750. It then passed to the Abbasids. The title was later taken by various rulers, notably the Ottomans until 1924.

Calvinism, the branch of Protestantism founded basically (athough preceded by Zwingli and others) by Jean Chauvin (1509–64), who was born in Noyon in Picardy. John Calvin, as he is usually called, from the Latin form of his name, Calvinius, provided in his *Institutions of the Christian Religion* the first logical definition and justification of Protestantism, thus becoming the intellectual leader of the Reformation as the older Martin Luther was its emotional instigator. The distinctive doctrine of Calvinism is its dogma of predestination which states that God has unalterably destined some souls to salvation to whom "efficacious grace and the gift of perseverance" is granted and others to eternal damnation. Calvinism, as defined in the Westminster Confession, is established in the Reformed or Presbyterian churches of France, Holland, Scotland, *etc.*, as contrasted with the Lutheran churches, and its harsh but logical beliefs inspired the French Huguenots, the Dutch in their fight against Spanish Catholic domination, and the English Puritans. The rule set up under Calvin's influence in Geneva was marred by the burning at the stake of the anatomist Servetus for the heresy of "pantheism", *i.e.* Unitarianism.

Perhaps its greatest single influence outside the Church was the result of Calvinist belief that to labour industriously was one of God's commands. This changed the medieval notions of the blessedness of poverty and the wickednesss of usury, proclaimed that men should shun luxury and be thrifty, yet implied that financial success was a mark of God's favour. In this way it was related to the rise of capitalism either as cause or effect.

Max Weber, the German sociologist, believed that Calvinism was a powerful incentive to, or even cause of, the rise of capitalism (*q.v.*): Marx, Sombart and Tawney asserted the reverse view—that Calvinism was a result of developing capitalism, being its ideological justification.

Capitalism is an economic system under which the means of production and distribution are owned by a relatively small section of society which runs them at its own discretion for private profit. There exists, on the other hand, a propertyless class of those who exist by the sale of their labour power. Modern capitalism, in the form Marxists refer to it, arose towards the end of the 18th cent. in England where the early factory owners working with small-scale units naturally approved of free enterprise and free trade. But free enterprise has no necessary connection with capitalism; by the beginning of the 20th century monopolies were developing and state protection against foreign competition was demanded. Capitalism is opposed by those who believe in socialism (*q.v.*), first, for the moral reasons that it leads to economic inequality and the exploitation of labour and the consuming public, and that public welfare rather than private profit should motivate the economic system; secondly, for the practical reason that capitalism has led to recurrent economic crises.

Cartomancy, the art of fortunes or predicting the future by playing cards or by the Tarot pack.

Caste System. *See* **Hinduism.**

Cathars. *See* **Albigenses.**

Catholic Reformation. *See* **Counter-Reformation.**

Catholicism. For those who are not Roman Catholics the term "Catholic" has two separate meanings. The more general refers to the whole body of Christians throughout the world, the more specific refers to a particular view of Christianity. In this latter sense the Church of England, the Orthodox Eastern Churches, and others consider themselves "Catholic" meaning that (*a*) they belong to Christ's Church as organised on an accepted basis of faith and order; (*b*) they insist on the necessity of "liturgical" worship through its established forms (*e.g.*, baptism, holy communion); (*c*) they emphasise the continuity of Christian tradition by the use of ancient creeds (*e.g.*, the Apostles' Creed, the Nicene Creed) and regard the ministry as a succession (Apostolic succession) deriving from early practice.

In this sense there is no necessary contradiction between Catholicism and Protestantism regarded as a renewal of the Church in the 16th cent. by an appeal to the Scriptures as interpreted by the early Fathers of the Church.

This definition obviously excludes Quakers, Christian Scientists, and many Nonconformist sects. *See also* **Roman Catholic Church**.

Characterology, the attempt made over many centuries to classify people into personality types on the basis of physical or psychological characteristics. The first attempt was made by Hippocrates in the 5th cent. B.C. who classified temperaments into the *sanguine* (or optimistic), the *melancholic*, the *choleric* (or aggressive), and the *phlegmatic* (or placid).

Theophrastus, a pupil of Aristotle, described, with examples, thirty extreme types of personality (*e.g.* the talkative, the boorish, the miserly, *etc.*); these were basically literary and imaginative but at same time "physiognomy" arose which attempted to interpret character from the face.

Physiognomy subsequently became of importance again during the Renaissance and there are still those today who believe in it in spite of the fact that, broadly speaking, there is no connection whatever between facial features and personality (*i.e.* although it may be possible to tell from the features that a man is an idiot or some extreme abnormal type and some idea of character may be obtained from an individual's characteristic facial expressions, it is not possible to tell from the shape of the nose, height of the brow, or dominance of the lower jaw, whether anyone is weak, intellectual or determined). The old contention of the 19th century. Italian criminologist Cesare Lombroso that criminals show typical facial characteristics was convincingly disproved by Karl Pearson when he found that 3,000 criminals showed no major differences of features, carefully measured from a similar number of students at Oxford and Cambridge.

It has, however, been noted that people in general tend to be intellectual or emotional, inward- or outward-looking, and this observation is reflected in the classification of the

Scottish psychologist, Alexander Bain (d. 1903), into intellectual, artistic, and practical; Nietzsche's Apollonian and Dionysian types; William James's "tender" and "toughminded"; and C. G. Jung's introvert and extrovert.

Some connection has been found between temperament and body-build. The German psychiatrist Ernst Kretschmer (1888–1964) showed that manic-depressive patients and normal people who are extroverted and tend to alternate in mood (as do manic-depressives to an exaggerated degree) were usually short and stout or thick-set in build; schizophrenics and normal people, who both show shyness, serious or introverted reactions, were usually tall and slender. The former of "pyknic" body-build are "cyclothyme" in temperament, the latter with "schizothyme" temperament are of two bodily types—tall and thin or "asthenic" and the muscularly well-proportioned or "athletic".

The American Sheldon has confirmed these observations on the whole and gone into further details. According to him the basic body types are: (1) *endomorphic* (rounded build), corresponding to Kretschmer's pyknic, normally associated with the *viscerotonic* temperament (relaxed, sociable); (2) *mesomorphic* (squarish, athletic build), normally associated with the *somatotonic* temperament (energetic, assertive); and (3) *ectomorphic* (linear build) often associated with the *cerebrotonic* temperament (anxious, restless).

Glandular and metabolic factors have considerable effect on human personality and also, to some extent, on physique. It is not too surprising, therefore, to find an association between body build (or "somatotype" as Sheldon termed it) and general mood. Genetic conditions which shape, for example, the face can lead scientists to diagnose inherited disease.

Charismatic, the evangelical, 'New Church' Christian movement that has broken away from the traditional Church. The 'house church' movement is part of this rapidly-growing movement, which started in Britain with the 1987 'March for Jesus'.

Chartism, a socialistic movement in England (1837–55) which attempted to better the conditions of the working classes. Named after "The People's Charter" of Francis Place (1838), its radical programme demanded: (1) universal manhood suffrage; (2) vote by ballot; (3) equal electoral districts; (4) annual parliament; (5) payment of members; (6) abolition of their property qualifications.

Chartism was supported by the Christian socialists (*q.v.*), J. F. D. Maurice (1805–72), and Charles Kingsley (1819– 75) with certain qualifications. The movement, the first mass organisation of the industrial working class, had considerable influence on the evolution of socialism in England.

The movement failed from internal divisions.

Chauvinism, a term applied to any excessive devotion to cause, particularly a patriotic or military one. The word is derived from Nicholas Chauvin whose excessive devotion to Napoleon made him a laughing-stock.

Chirology, the subject concerned with the hand as an indicator of psychological and medical significance. Chirology derives from an Oriental tradition concerning mental and physical healing and spirituality and as such encompasses many associated arts and studies of direct relevance to modern day living. Palmistry in the main is a crude folk art and does not attempt to understand or clarify its own teachings.

The Cheirological Society was founded in 1889 by Katherine St. Hill to promote the systematic study of the hand as a serious subject worthy of scientific attention bereft of superstition and fakery. It still exists today and has members throughout the world.

Chiropractic, the art of manipulation of the joints, in particular the spine, as a means of curing disease. Some qualified doctors employ its principles and, as with its near-neighbour osteopathy, it seems on some occasions to be a useful treatment. It was founded in the 19th cent. by D. D. Palmer. Chiropractors are licensed by law in the UK.

Christadelphians, The Christadelphians (or Brothers of Christ) were founded in 1848 by an English doctor, John Thomas, who, having been saved from a shipwreck on his emigration to America, vowed to devote his life to the service of Christ. In 1849, believing that the Last Days had begun, he published Elpis Israel, 'The Hope of Israel' promising the restitution of the nation. It was not designed however to be a replacement for the Bible which Christadelphians regard as inerrant and the sole source of revelation. Congregationalist in background, Thomas also advocated local ecclesiastical authority, but went further in rejecting the need for a priesthood. Critical of other Christian Churches in their approach to the interpretation of the Bible and the nature of Christ, they are neither Trinitarian nor Unitarian in their dogma.

Christadelphians believe strongly in Christ's atoning work, but regard evil as a human failing rather than as the work of a supernatural power. Moreover, they do not believe in the traditional concepts of heaven, hell or the immortality of the soul, believing rather in a millenialist approach to the resurrection of the faithful upon earth. Although previous predictions have proved inaccurate, Christadelphians still feel strongly that the world is in its latter days.

Christianity, the religion founded by Jesus Christ whose teaching is found in the New Testament's four Gospels. Simple as His creed may seem it soon became complicated by the various ways in which Christians interpreted it, and the differences within the early Church are reflected in the numerous Councils held to define truth from heresy. The Eastern Church of the Byzantine Empire from the 5th cent. onwards had differed in various ways from the See of Rome and by 1054 the breach became permanent. The 16th cent. Reformation was the other great break in the unity of the Church and once Protestantism had given in effect the right to each man to interpret the Scriptures in his own way, the tendency to fragmentation increased so that, by 1650, there were no fewer than 180 sects, mostly dogmatic and intolerant towards each other. Today there are thousands more.

There are signs today that the trend of disunity is being reversed. The modern ecumenical movement, which has its roots in the great missionary movement of the 19th cent., aims to bring about a reunion of Christendom by uniting Christians throughout the world on the simple basis of the acceptance of Jesus Christ as God and Saviour, *i.e.*, on the basis of Christian fellowship. The movement finds expression in the World Council of Churches (*q.v.*). The Christian life is expressed in the words of Christ: "Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself."

For many it is the humanitarian side of Christianity that has meaning today; to accept responsibility for others, as well as for oneself.

Christians today are faced with persecution in numerous countries such as Pakistan, Nigeria, Iraq *etc*. The countries with the most Christians are the USA (260m), Brazil (185m) and Russia (115m) but eventually China could surpass them all. It has over 70 million Christians at present.

Christian Democracy has its roots in the 1891 papal encyclical *Rerum Novarum* of Pope Leo XIII. This encyclical encouraged Roman Catholics to organise and engage with the nascent democracies of Europe. The Roman church expressed anxiety at the growth of atheistic communism, increased material inequality, and the projection of the state's influence deeper into the fabric of social life. During the early 20th century, Christian democracy became less exclusively Roman Catholic as Christian democratic political parties drew in supporters from many Christian denominations.

Christian democratic parties shared an opposition to the increased jurisdiction of the state, particularly at the service of radical political ideology. This rather conservative attitude to government was also combined with a strong commitment to social justice through welfare reform. Following World War II, Christian democratic parties became powerful and popular as they offered a moderate and sceptical approach to the role of government combined with support of redistribution and welfare provision.

Christian Science. Founded around 1866 by Mary Barker Eddy, Christian Science is noted for its belief in the power of spiritual healing practised and inaugurated by Christ Himself. It uses as its key text along with the Bible, 'Science and Health with Key to the Scriptures,' although this has undergone substantial revisions over time. Literature forms a very important part of the life of Christian Scientists, and compulsory purchase of reading material is an important Church practice. The worship follows the 'Church Manual' laid down by Mrs. Eddy in 1895.

Christian Science uses the term healing to refer to all the 'ills' which befall mankind, and they argue that moral regeneration goes hand in hand with physical restoration. Members make a commitment to refrain from harming their bodies to the extent of avoiding tea and coffee, and abstain from non-marital sexual relationships. Non-trinitarian in nature, Christian Scientists believe that the Christ-spirit has been present in good men and women down the ages.

Christian Socialism, a movement launched in 1848, a year of revolutions throughout the continent, by a group in England designed to commit the church to a programme of social reform.

The leaders, notably J. F. D. Maurice, Charles Kingsley (both Anglican clergymen), and John Ludlow were deeply moved by the wretched conditions of the British working class and the two priests had, indeed, given active support to the Chartist movement (*q.v.*). However, all insisted that socialism in its existing forms ignored the spiritual needs of mankind and must be tempered with Christianity. Tracts were written to expose the sweated industries and the evils following the enclosure system; but, more concretely, Christian socialism fostered co-operative workshops and distributive societies based on those of the Rochdale pioneers, organised a working-man's college, and set up elementary classes for education. The traditions of Christian socialism have been carried on by the Fabian Society and by adherents of Guild Socialism.

Church of England. There is some evidence of possible continuity with the Christianity of Roman Britain, but in the main the Church derives from the fusion of the ancient Celtic church with the missionary church of St. Augustine, who founded the See of Canterbury in A.D. 597. To archbishop Theodore in 673 is ascribed its organisation in dioceses with settled boundaries, and in parishes. St. Augustine's church was in communion with Rome from the first, but the Church of England was not brought within papal jurisdiction until after the Norman conquest, and was never under the total domination of Rome.

It remains (at least in one sense) the Catholic Church of England without break of continuity, but during the Reformation the royal supremacy was accepted and that of the pope repudiated. It is the Established Church (*i.e.*, the official church of the realm), crowns the sovereign, and its archbishops and bishops in the House of Lords can act as a kind of "conscience of the state" at every stage of legislation. Some argue that the Church should now be disestablished. The Church is organised in two ecclesiastical provinces (Canterbury and York) and 43 dioceses. There are 16,000 churches, but this total includes 2,000 with less than 10 weekly parishioners. Around 760,000 people regularly attend (a major decline in the last 30 years). Funerals conducted by the Anglican Church are now at their lowest-ever level.

Its traditional forms of worship are embodied in the Book of Common Prayer, but the Alternative Service Book of 1980 is also widely used. A new service book, *Common Worship*, was introduced in 2000. The 39 articles (*see also* **Tractarianism**) embody its main tenets.

In 1992, the General Synod finally accepted the ordination of women priests. The first 32 women priests were ordained on 12 March 1994 in Bristol Cathedral. The first 42 Anglican women priests in Scotland were ordained in the Scottish Episcopal Church in December 1994. (the first female priest in the Anglican Communion was ordained in 1944).

The first women priests in Wales were ordained in 1997, whilst in 1996 the Movement for the Ordination of Women was reformed to campaign for Anglican women bishops. In 2006 the Synod decided that the ordination of women bishops is theologically justified. A further step forward was taken in July 2010, but the 2012 Synod rejected ordination by a mere six votes. In 2014 women were finally victorious in their struggle to become bishops.

Controversy surrounded the decision in 2002 by the Church of England to relax its ban on divorcees remarrying in Church (although remarriage of divorcees was previously forbidden, in practice all 43 dioceses allowed remarriage in certain circumstances).

The crisis reached a new height in 2003, caused by three events: the nomination (and subsequent withdrawal) of the gay Dr Jeffrey John as Bishop of Reading; the election of the openly gay Canon Gene Robinson as Bishop of New Hampshire by the Episcopal Church of America; and the same-sex blessings authorised in New Westminster, Canada.

An emergency conference of the 38 primates held at Lambeth Palace in October 2003 established a commission to investigate these issues, narrowly avoiding schism. The ensuing Windsor Report urged moderation and restraint. The failure of the 2005 Anglican "summit" in Northern Ireland left the Church still facing great divisions. In 2007 Gordon Brown announced that the Prime Minister would no longer have a part to play in selecting bishops.

Against a background of divisions over the issues of gay priests and women bishops, and with falling congregations, the Anglican Church faces a difficult future. At the same time, the expanding population of ethnic minorities is seeing the rise of 'black majority' churches (*e.g* the Redeemed Christian Church of God).

In October 2009 a controversial Vatican initiative offered disaffected Anglicans "personal ordinariates", allowing them to enter into full communion with the Catholic Church whilst preserving elements of their Anglican identity.

In 2011 the Church gave the go-ahead for celebate gay men in civil partnerships to become bishops. In 2013 Justin Welby, the Bishop of Durham, succeeded Rowan Williams as Archbishop of Canterbury. Also in 2013, a new 'super-diocese' of Leeds was created (the first new diocese since 1927). In 2013 the Church in Wales approved women bishops. In January 2015 Libby Lane, the first woman bishop in England, was consecrated as Soffragan Bishop of Stockport. In March 2015 Rachel Treweek was appointed diocesan Bishop of Gloucester. In January 2017 the Church in Wales consecrated its first woman bishop at St. Davids.

The Anglican Communion comprises *c.* 80 million Christians in 44 self-governing churches (in 34 provinces) spread across 164 countries which are in communion with the Church of England. All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (first held in 1867), over which the Archbishop of Canterbury by custom presides as *primus inter pares*. At the 1968 Conference observers and laymen were admitted for the first time. The 1998 Lambeth Conference (attended by 798 bishops) strongly supported the traditionalists over homosexuality issues.

The 2008 Lambeth Conference, boycotted by many conservative bishops, managed to avoid open schism by some tortuous agreements to keep the divided parties together. Likewise, in 2016, only the suspension of the liberal Episcopal Church in America prevented a deeper split.

Church of Jesus Christ of Latter Day Saints (Mormons). Better known as the Mormon religion, from its origins in New York State in the 1820s, the Church of Jesus Christ of Latter Day Saints now has more than 11 million members worldwide. Although there is much dispute over the details, the movement was founded by Joseph Smith who at the age of 14 asked God which denomination of Christianity was the true one. In a vision, he was told that all were wrong and that he should wait a few years. In 1823, he had another vision of the angel Moroni who directed him to dig up golden plates buried in a hillside. Smith began to translate the text in 'reformed Egyptian hieroglyphs' using special eye-glasses, dictating it to his wife from behind a curtain. The first edition of the 'Book of Mormon: Another Testament of Jesus Christ' was published in 1830. It focuses on two migrations of mysterious Jewish tribes to America, one of whom, the Nephites were visited by Christ after his resurrection. The last of the tribe were the prophet Mormon and his son Moroni who created the golden tablets.

Although continuous revelation remains an important element of doctrine, it can come only from the Presidents of the Church, who have followed Smith. His own authority and power in the early progress of the movement was questioned, leading to dissension and eventually to Smith's murder in 1844. His successor was Brigham Young, who in 1847 led the breakaway to the Great Salt Lake Valley which is now in Utah. Mormons continued to attract hostile criticism however, largely owing to their belief in polygamy which was abandoned in 1890. Of importance for Mormons is the belief that the new Jerusalem will be built in America. They also have an unorthodox belief in the Trinity which claims that both God the Father and God the Son have bodily forms. A key belief is in the pre-existence of souls which come from God who lives with his family on a planet near the star Kolob.

Although Mormons worship in churches, many of their most important rites take place in Temples, and are said to have links with Masonic practices. Special clothing is worn and admission reserved for certain members in order to ensure sacredness. This relates to the very complex system of hierarchy and government within the Church. Mormons have very strict views about morality and oppose the use of any stimulants.

Members are encouraged to give two years free service to the Church, which is often spent abroad in missionary work. In recent years, Mormons have grown rapidly in the developing world. In Britain, there are around 200,000 Mormons. Many Mormons worldwide are leaving over its opposition to same-sex marriage.

Until 1978, the Mormons taught their followers that black people were cursed and they were barred from becoming priests.

Church of Scotland, the established national church of Scotland, presbyterian in constitution, and governed by a hierarchy of courts—the kirk-sessions, the presbyteries, the synods, and the General Assembly. Its congregations have declined rapidly in recent years (from 1,133,000 in 1971 to below 375,000 today). It has only *c.* 800 ministers for its 1,400 congregations. It has recently authorised the approval of same-sex weddings. A serious split arose in May 2009 when the General Assembly upheld the appointment of a gay minister to Queen's Cross parish church. The ban on openly gay ministers was lifted in May 2013. There are ongoing talks with the Church of England to seek agreement based on the Columba Declaration. *See* **Presbyterianism**.

Clairvoyance. *See* **Telepathy**.

Collectivism. The theory of the collective ownership or control of all the means of production, and especially of the land, by the whole community or state, *i.e.* the people collectively, for the benefit of the people as a whole. The term has also acquired a broader sense, to denote the view that the individual is subordinate to the social collectivity. An influential expression of collectivist ideas can be found in Rousseau's *Du contrat social* (1762). It is an important theme in Hegel and Marx, and has been expressed in such movements as socialism, communism and fascism. Collectivism is to be contrasted with individualism (*q.v.*).

Colonialism. Colonialism refers to the kind of imperialism practised by European countries in for example Africa and S.E. Asia, where the colonised country was allowed to have partially autonomous legal and social institutions, while the mother country retained supreme power, and the colonial community had social and political rights denied to the natives. "Neo-colonialism" means the cultural and economic infiltration of developing countries by manipulation of market forces. *See also* **Imperialism.**

Communism, ideally refers to the type of society in which all property belongs to the community and social life is based on the principle "from each according to his ability, to each according to his needs." There would be public ownership of all enterprises and all goods would be free.

Since no such society as yet exists, the word in practice refers to the attempt to achieve such a society by initially overthrowing the capitalist system and establishing a dictatorship of the proletariat (Marx identified the dictatorship with a democratic constitution). Communists believe that their first task is the establishment of socialism under which there remain class distinctions, private property to some extent, and differences between manual and brain workers. The state is regulated on the basis "from each according to his ability, to each according to his work".

Lenin applied Marx's analysis to the conditions which had arisen in 20th-cent. capitalist society. Marxism–Leninism develops continuously with practice since failure to apply its basic principles to changed circumstances and times would result in errors of dogmatism. Mao Tse-tung worked out the techniques of revolutionary action appropriate to China; Che Guevara the tactics appropriate to the peasants of Latin America.

A fundamental principle of communism is the class struggle between oppressed and oppressing classes and between oppressed and oppressor nations. Maoism, for example, held that it was a mistake to lay one sided stress on peaceful transition towards socialism otherwise the revolutionary will of the proletariat becomes passive as well as unprepared for the tasks ahead.

In Russia the civil war developed *after* the revolution; in China the communists fought their civil war *before* they seized power: the Yugoslav partisans won their own guerrilla war *during* their stand against the fascist powers— differences which had important political consequences. Russia suffered decades of isolationism and totalitarian suppression before the old Soviet Union collapsed. *See* **Maoism, Marxism** and **Trotskyism**.

Confucianism. Confucius (Latinised form of K'ung-Fo-tzu) was born in 551 B.C. in the feudal state of Lu in modern Shantung province. He was thus a contemporary of Buddha, although nobody could have been more dissimilar. Where Buddha was metaphysical in his thought, Confucius was practical; Buddha was original, Confucius had hardly an original idea in his head; Buddha wanted to convert individuals to an other-worldly philosophy. Confucius wanted to reform the feudal governments of his time, believing that in this way their subjects would be made happier. Other religions have in their time, been revolutionary; Confucius was a conservative who wanted to bring back a golden age from the past.

Much of his time was spent in going from the court of one feudal lord to another trying to impress them by his example. For he suffered from the curious belief that the example set by the ruler influences his subjects. He made much of etiquette, trembling and speaking in low tones and behaving with "lofty courtesy" to his inferiors. Promoting the idea of "the golden mean", he was not impressed by heroic deeds or unusual people, and was greatly displeased when he heard that a truthful son had reported that his father had stolen a sheep: "Those who are upright", he said, "are different from this; the father conceals the misconduct of the son, and the son conceals the misconduct of the father." One feels that Confucius would have felt not at all out of place in an English public school. Virtue brings its own reward in this world, ceremonial is important, politeness when universal would reduce jealousy and quarrels; "reverence the spirits but keep them far off." Destiny decides to what class a man shall belong, and as destiny is but another name for Nature prayer is unnecessary, for once having received his destiny, a man can demand and obtain from Nature what he chooses, his own will decides. In Confucian society, women played a lowly role.

Congregationalists, the oldest sect of Nonconformists who hold that each church should be independent of external ecclesiastical authority. They took their origin from the Brownists of Elizabeth's days. Robert Browne (*c.* 1550–*c.* 1633), an Anglican clergyman, who had come to reject bishops, was forced with his followers to seek refuge, first in Holland and then in Scotland where he was imprisoned by the Kirk.

Later he changed his views and is disowned by Congregationalists because of his reversion to Anglicanism. His former views were spread by Henry Barrow and John Greenwood who, under an Act passed in 1592, were hanged at Tyburn.

They had preached (*a*) that the only head of the church is Jesus Christ; (*b*) that, contrary to Elizabethan doctrine, the church had no relationship to the state; (*c*) that the only statute-book was the Bible whereas the Articles of Religion and Book of Common Prayer were mere Acts of Parliament; (*d*) that each congregation of believers was independent and had the power of choosing its own ministers. The body fled once more to Holland and were among the Pilgrims who set sail in the *Mayflower* in 1620 whilst those who remained were joined by Puritans fleeing from Charles I.

They became free once more to live in England under the Commonwealth only to be repressed again under Charles II. Finally full liberty of worship was granted under William III. In 1833 the Congregational Union of England and Wales was formed which had no legislative power. It issued a Declaration of Faith by which no minister was bound; he was responsible only to his own church.

The sect is widespread both in Britain and the USA where it is held in special honour because of its connection with the Pilgrim Fathers. In 1972 the Congregational Church in England and Wales and the Presbyterian Church of England united to form the United Reformed Church. Those who did not join comprise the Congregational Federation.

Conservatism, is sceptical of rationalism as the lodestar of politics and social life. Conservatives instead prefer the inherited wisdom of tradition and history, regarding the persistence of values and institutions through time as a good pragmatic reason to justify their authority. Edmund Burke crystallised conservatism in his '*Reflections on the Revolution in France*' which argued that society was an organic unity with a naturally hierarchical relationship between its parts. A similar opposition to rationalism in politics was expressed in the 20th century by Michael Oakeshott. Oakeshott argued that socialism's rational approach to politics ignored the style of human relationships that were ordered more by experience, tradition, wisdom and prudence *etc.*

Contemporary conservative politics has been dominated more by neoliberalism (*q.v.*) than traditional conservative values. Contemporary conservatives share an opposition to social democratic values and bureaucratic state institutions, but favour a view of society as a free market rather than an organic unity.

Consumerism. Traditionally, an individual's identity and role in society was seen as determined by what they produced. Being a miner, a farmer, or an office clerk would contribute greatly to the nature of a person's income, social class, and opportunities. Increased prosperity, wider social and geographical mobility, and more pervasive markets have allowed for consumption to be a more important and dominant feature of the identity of persons and societies.

The proliferation of choice and products, combined with relentless advertising, has allowed consumerism to pervade all areas of life and society: toddlers and children are important consumers in contemporary markets.

Consumerism has also encroached on politics, and not simply in the promotion of political parties as brands and products. Parents and the sick are encouraged to see health and education as products to be consumed in a competitive market place. Successive governments justified this on the grounds that people expect choice in all areas of life, and that competition for consumers improves the quality of products, whether toasters, health, or education.

Cooperativism. A cooperative is an organization owned by and operated for the benefit of its members, who may be either workers or customers. They have been set up all over the world, for farming, purchasing of equipment and raw materials, and in wholesaling, retailing, banking, insurance and housing industries. In most cooperatives the members receive a share of the net earnings. The modern consumer cooperative movement started as the Rochdale Pioneers Society in 1844 and developed rapidly in the second half of the 19th century, mostly in the industrial areas of Northern England and Scotland. It spread quickly through northern Europe. Development in the USA and Latin America came later in the 20th century. The Cooperative Bank was established in the UK in 1872.

Coptic Church, the sect of Egyptian Christians who, holding "Monophysite" opinions (*i.e.*, refusing to grant the two natures, God and Man, of Christ), were declared heretical by the Council of Chalcedon in 451. They practise circumcision and have dietary laws. Their language is a direct descendant of ancient Egyptian. Like the Armenians, they are regarded as an heretical branch of Eastern Christianity. Their religious head is Patriarch Tawadros III. They are the largest Christian minority in the Middle East. They are currently suffering persecution.

Corporate State. State whose economic and political life is based on trade and on professional corporations rather than territorial units. Thus members of parliament would be elected by vocational corporations instead of by geographical constituencies and would regulate industrial production and working conditions. The arguments in favour of such a system are that it would exclude party politics, prevent the state from growing too powerful and correspond to the links which truly bind people (professional ties, fellowship in the workplace and shared economic interest) rather than haphazard territorial association and that it would end class warfare. Believers in the theory have no particular bias to right or left although the societies which have come closest to being corporate states were Italy under Fascism and Portugal under the dictator Salazar (1928–74). The Catholic Church tended to favour the idea and Nazi Germany toyed with plans for it.

Counter-Reformation. A movement in the 16th and 17th centuries in Europe, by which the Roman Catholic church reformed itself, defined its doctrines, strengthened its discipline and halted the advance of Protestantism. The Council of Trent (1545–1563) aimed at removing abuses within the church and defining Catholic thought in the debate with Protestantism. New, more active religious orders were founded, in particular the Jesuits (1534).

The greater control exercised over church doctrine was seen in the setting up of the Inquisition and an Index of Prohibited Books. Some historians now prefer the term Catholic Reformation to Counter-Reformation.

Creationism. The theory which attributes the origin of matter, the different species of plants and animals, *etc.*, to "special creation" by a supreme being or deity. This '"Theory of Intelligent Design" suggests that certain organisms are so complex that they could only be the product of supernatural design rather than natural selection. Creationists thus accept that the Book of Genesis is a literal description of the beginning of the world. It is this doctrine which fundamentalist Christians have opposed to the evolutionary theories of Darwin, which are now accepted by most scientists since the publication of *The Origin of Species* in 1859.

An attempt was made in the 1980s in the USA to have creationism taught alongside evolution, but failed in the US Supreme Court.

A second slightly older meaning of the term is in reference to the theory that God creates a soul for every being born.

Cryonics, the practice of preserving humans using ultra-cold temperatures until medicine is sufficiently advanced to restore good health. In 1964, the publication by Robert Ettinger of *Prospect* of *Immortality* increased interest in the idea.

Cynics, a school of philosophy founded in the time of Alexander the Great by Diogenes. Choosing to live like a dog by rejecting all conventions of religion, manners, or decency, and allegedly living in a tub. Diogenes unwittingly brought on his school the title "Cynic", meaning not "cynical", as the word is understood today, but "canine".

His teacher, Antisthenes, who had been a disciple of Socrates, decided, after the latter's death, that all philosophy was useless quibbling and man's sole aim should be simple goodness. He believed in a return to nature, despised luxury, wanted no government, no private property, and associated with working men and slaves. Far from being cynics in the modern sense, Diogenes and Antisthenes were virtuous anarchists rather like Tolstoy.

Demonism, Demons, and the Devil. Demons are ethereal beings of various degrees of significance and power which are believed to be implicated in men's good, but especially evil, fortune. They are common to most cultures. From the anthropological point of view the demon arose as a widespread concept in the following ways: (1) as a psychological projection into the outer world of man's own good or evil emotions and thoughts; (2) as a survival of primitive animism (*q.v.*), thus spirits are believed to haunt places, trees, stones, and other natural objects; (3)

when by warlike invasion the gods of the vanquished become the devils of the conquerors (as when the Jews occupied Canaan); (4) as a primitive belief that spirits of the dead continue after death to hover near their former habitation, and not always entirely welcome to the living; (5) the conception of a supreme source of evil (the Devil or Satan) which took shape among the Jews during their sojourn in Babylon under the influence of Zoroastrianism (*q.v.*), a religion in which the struggle between the two spirits, Good and Evil, reached its height in the imagination of the ancient world.

The Satan of the Old Testament was first regarded as one of God's servants (in the Book of Job he goes up and down the earth to see whether God's commands are obeyed), but when the Jews returned from their captivity he had become identified with Ahriman, the spirit of evil, who was in continual conflict with Ahursa Mazda, the spirit of good. The primitive mind ascribed both good and evil to one power alone; the division into God and the Devil, priest and witch, belongs to a higher stage of civilisation. The worship of evil itself, or of its personification in Satan, is a curious practice which seems to have developed hand-in-hand with Christianity and to have received steady support from a small but measurable minority.

Determinism and Free-will. The question of whether man is, or is not, free to mould his own destiny is one which has exercised the minds of philosophers since Greek mythology conceived of the Fates as weaving a web of destiny from which no man can free himself. Socrates emphasised that man could through knowledge influence his destiny whilst ignorance made him the plaything of fate; Plato went further in pointing out that man can, and does, defeat the purposes of the universe and its divine Creator. It is our duty to live a good life, but we can live a foolish and wicked one if we chose. Aristotle wrote "Virtue is a disposition or habit involving deliberate purpose or choice". If this were not so morality would be a sham.

The Problem for Theology. The last of the great philosophers of Antiquity and one of the great influences in moulding Catholic theology was Plotinus (*c.* 204–70). Soul, he taught, is free, but once enmeshed in the body loses its freedom in the life of sense. Nevertheless, man is free to turn away from sensuality and towards God who is perfect freedom; for even when incarnated in matter the soul does not entirely lose the ability to rescue itself. This conception was carried over into the beliefs of the early Christian Apologists because it appeared to be in line with the teaching of Jesus that He had come to save man from sin. Sin implies guilt, and guilt implies the freedom to act otherwise; furthermore an all-good God cannot be responsible for the sin in the world which must be man's responsiblity and this again implies freedom.

Pelagius (*c.* 355–*c.* 425), a Welsh priest, not only believed in free-will but questioning the doctrine of original sin, said that when men act righteously it is through their own moral effort, and God rewards them for their virtues in heaven. This belief became fairly widespread and was declared a heresy by the Church, being attacked notably by St. Augustine (354–430), a contemporary of Pelagius, who believed in predestination—that, since the sin of Adam, God had chosen who in all future history would be saved and who damned. This represents one tradition in Christianity: the determinism which leads to Calvinism (*q.v.*).

St. Thomas Aquinas (1227–74), the greatest figure of scholasticism and one of the principal saints in the Roman Catholic Church, compromised between the two positions in the sense that, believing man to be free, he yet held that Adam's sin was transmitted to all mankind and only divine grace can bring salvation. But even when God wishes to bestow this salvation, the human will must cooperate. God foresees that some will not accept the offer of grace and predestines them to eternal punishment.

The Problem for Philosophy. With the Renaissance, thinkers began to free themselves from the domination of the Church and so study the world objectively and freely without preconceptions. But the more man turned to science, the more he discovered that the world was ruled by apparently inexorable laws and, since the scientist must believe that every event has a cause, he was led back to determinism. Man as part of the universe was subject to law too and all that existed was a vast machine. Francis Bacon (1561–1626) separated the fields of religion and science but left man subject completely to the will of God. Thomas Hobbes (1588–1679) was a rigid determinist and materialist although, having had trouble with the church in France whence, as a royalist, he had fled, he took care to announce that the Christian God is the Prime Mover.

Descartes. Modern philosophy begins with René Descartes (1596–1650), a Frenchman who tried to reconcile the mechanical scientific universe of his time with the spiritual need for freedom.

He did this by separating completely mind and body; the former, he said, is free, the latter completely determined. But, by admitting that the will can produce states of body, he was left with the problem of how this could happen—a problem which the so-called Occasionists solved to their own satisfaction by stating that the will is free and God so arranges the universe that what a person wills happens. Baruch Spinoza (1632–77), a Dutch Jew whose independence of thought had led to his excommunication from the Amsterdam Synagogue in 1656, was a complete determinist. He asserted that God and Nature are one, everything that happens is a manifestation of God's inscrutable nature, and it is logically impossible that things could be other than they are. Thus both Hobbes and Spinoza were determinists for entirely opposed reasons. The former as a materialist, the latter because he believed in the absolute perfection and universality of God. Yet the great religious mystic and mathematician Blaise Pascal (1623–62) held that, no matter what reason and cold logic may indicate we *know* from direct religious experience that we are free. John Calvin (1509–64) and Martin Luther (1483 1546) were both determinists. *See* **Calvinism, Lutheranism**.

Locke and Hume. To the British philosophers, John Locke (1632–1704) and David Hume (1711–76), free-will was related to personality. Locke believed that God had implanted in each individual certain desires and these determine the will; the desires are already there, but we use our will to satisfy them. Hume argued that a man's behaviour is the necessary result of his character and if he had a different character he would act otherwise. Accordingly, when a man's actions arise from his own nature and desires he is free. He is not free when external events compel him to act otherwise (*e.g.*, if he strikes another because his own nature is such he is free as he is not if he is compelled to do so against his desire). Leibnitz (1646–1716), although as a German metaphysical philosopher holding very different general views, said much the same thing—that choice is simply selecting the desire that is strongest. But most of the 18th cent. thinkers after Voltaire, with the great exceptions of Rousseau and the later German philosophers Kant, Fichte, Schopenhauer, and Hegel, who were initially influenced by him, accepted determinism. Rousseau (1712–78) began to stem the tide by his declaration that man is a free soul striving to remain free and only prevented from being so by society and the cold science which stifles his feeling heart. Once again the will became important as Kant (1724–1804) asserted that belief in freedom is a moral necessity although it cannot be proved by reason; the moral nature of man shows that there is a "transcendental" world beyond the senses where freedom applies. Fichte and Schelling found freedom in the Absolute ego or God, of whom each individual was part and thus also free. Hegel (1770–1831) saw the whole universe as evolving towards self-awareness and freedom in man although this could only be fully realised in a society that makes for freedom. Even God himself only attains full consciousness and self-realisation through the minds of such individuals as are free. This is the goal of the dialectical process. (*See* **Dialectical Materialism.**)

The Scientist's View. For the scientist the law of cause and effect is a useful hypothesis since, by and large, it is necessary for him to assume that all events are caused. Nevertheless the modern tendency is to think in terms of statistical probability rather than relentless mechanistic causality, and, although the free-will problem does not concern the scientist as such, it is clear that freedom and determinism (assuming the terms to have any meaning at all) are not necessarily opposed. In sociology, for example, we *know* that certain actions will produce certain results upon the behaviour of people in general, *e.g.*, that raising interest rates will discourage business expansion. But this does not mean that Mr. Brown who decides in the circumstances not to add a new wing to his factory is not using his free-will. Even in the case of atoms, as Dr. Bronowski has pointed out, the observed results of allowing gas under pressure in a cylinder to rush out occur because most of the atoms are "obeying" the scientific "law" relating to such situations. But this does not mean that some atoms are not busy rushing across the stream or even against it—they are, but the general tendency is outwards and that is what we note. Lastly, the modern philosophical school of Logical Analysis would probably ask, not whether Free-will or Determinism is the true belief, but whether the question has any meaning. For what scientific experiment could we set up to prove one or the other true? The reader will note that some of the philosophers mentioned above are using the words to mean quite different concepts.

Dialectical Materialism, the combination of Hegel's dialectic method with a materialist philosophy produced by Karl Marx (1818–83) and his friend Friedrich Engels (1820–95). It is the philosophical basis of both **Marxism** (*q.v.*) and **Communism** (*q.v.*) "Dialectic" to the ancient Greek philosophers meant a kind of dialogue or conversation, as used particularly by Socrates, in which philosophical disputes were resolved by a series of successive contradictions: a thesis is put forward and the opposing side holds its contradiction or antithesis until in the course of argument a synthesis is reached in which the conflicting ideas are resolved.

From Thesis through Antithesis to Synthesis. Hegel in the 19th cent. put forward the view that this process applies to the course of nature and history as they strive towards the perfect state. But to him, as to the Greeks, the conflict was in the field of ideas. The "universal reason" behind events works through the ideas held by a particular society until they are challenged by those of another which supersedes them and in turn, usually by war, becomes the agent of universal reason until the arrival of a new challenger. Hegel therefore regarded war as an instrument of progress and his Prussian compatriots found no difficulty in identifying their own state as the new agent of progress by universal conquest.

Feuerbach, Lassalle, and other early socialists were impressed by some of Hegel's ideas: *e.g.*, that societies evolved (with the assumption that finally their own ideal society would be achieved) and that truth, morals, and concepts were relative so that a society that was "good" at one time was not necessarily so at another.

However, Marx and Engels in effect turned Hegel upside-down, accepted his dialectic but rejected his belief that ideas were the motive force. On the contrary, they said, ideas are determined by social and economic change as a result of materialistic forces. (*See* **Calvinism,** where it is pointed out that the Marxist view is not that Calvin changed men's economic ideas but rather that a developing capitalism unconsciously changed his.) The historical materialism of Marxism purports to show that the inexorable dialectic determines that feudalism is displaced by capitalism and capitalism by creating a proletariat (its antithesis) inevitably leads to socialism and a classless society. The state, as a tool of the dominant class, withers away. Dialectical materialism is applied in all spheres. As a philosophy there is little to be said for it save that it has shown us the close dependence of man's thoughts upon material and social conditions. But as a battle-cry it wielded immense power over the minds of men. *See also under* **Marxism**.

Dianetics. *See* **Scientology**.

Diggers, one of the many sects which flourished under the Commonwealth (others were the Muggletonians, the Levellers, the Millennarians, and the Fifth Monarchy Men), so-called because they attempted to dig (*i.e.* cultivate) untilled land. Gerrard Winstanley, a profoundly religious man, and leader of the Diggers, believed in the economic and social equality of man and castigated the clergy for upholding the class structure of society. In his book *The True Leveller's Standard Advanced* (1649) he wrote: "Every day poor people are forced to work for fourpence a day, though corn is dear. And yet the tithing priest stops their mouth and tells them that "inward satisfaction of mind' was meant by the declaration "the poor shall inherit the earth'. I tell you, the Scripture is to be really and materially fulfilled. You jeer at the name "Leveller'; I tell you Jesus Christ is the Head Leveller".

Diwali, the annual "festival of lights", celebrated by Hindus, Sikhs and Jains, held between mid-October and mid-November.

Doukhobors, a religious sect of Russian origin, founded by a Prussian sergeant at Kharkov in the middle of the 18th cent., and now mainly settled in Canada. Like many other sects they belong to that type of Christianity which seeks direct communication with God and such bodies tend to have certain traits in common, such as belief in the "inner light", opposition to war and authority in general, and often ecstasies which show themselves in physical ways such as shaking, speaking in strange tongues (glossolalia), and other forms of what to the unbeliever seem mass hysteria. Liturgy, ritual, or ceremony is non-existent.

The Doukhobors were persecuted in Tsarist Russia, but in 1898 Tolstoy used his influence to have them removed to Canada in what is now Saskatchewan.

Dowsing. *See* **Radiesthesia**.

Dreamtime, in Australian aboriginal mythology, the period of time when mystic beings shaped the natural environment. Some of these mystic beings took human form. Human life was created by the great fertility mother. To the aborigines, these mystic beings are spiritually alive today. Alternative names for this period are *World Dawn* or *The Dreaming*.

Druidism, the ancient religion of Celtic Britain and Gaul of which Druids were the priesthood. They were finally wiped out by the Roman general Suetonius Paulinus *c.* A.D. 61 in their last stronghold, the island of Anglesey. There are two sources of our present knowledge of Druidism:

(1) the brief and factual records of the Romans, notably Pliny and Julius Caesar, which tell us that they worshipped in sacred oak groves and presumably practised a religion doing reverence to the powers of nature.

(2) the beliefs put forward by William Stukeley, an amateur antiquarian who from 1718 did valuable work by his studies of the stone circles at Stonehenge and Avebury. However, influenced by the Romantic movement, he later put forward the most extravagant theories. Stonehenge and Avebury were depicted as the temples of the "white-haired Druid bard sublime" and an attempt was made to tie up Druidism with early Christianity, above all with the concept of the Trinity. In fact, these circles have no connection with the Druids. They may have made ceremonial use of them but recent evidence suggests that the megalithic stones at Stonehenge belong to a Bronze Age culture (2100–1600 B.C.). Nor have Druidism and Christianity any relationship.

In 2010 Druidism became the first pagan practice in the UK to be given official recognition as a religion by the Charity Commission.

Druze, an offshoot of Islam, with around 200,000 followers in Lebanon and *c.* 1·5 million globally. Most lived in Syria before the 2011 uprising there.

Dualism, any philosophical or theological theory which implies that the universe has a double nature, notably Plato's distinction between appearance and reality, soul and body, ideas and material objects, reason and the evidence of the senses, which infers that behind the world as we perceive it there lies an "ideal" world which is more "real" than that of mere appearance. In religions such as Zoroastrianism or the Gnostic and Manichaeism heresies, it was believed that the universe was ruled by good and evil "principles"—in effect that there was a good God and a bad one. In psychology, dualism refers to the philosophical theories which believe mind and body to be separate entities. The opposite of dualism is monism which asserts the essential unity of the substance of the universe.

An essential problem in the dualistic view lies in the question as to how and where the two separate and distinct properties of the universe interact. Where, for example, does the "mind" actually mesh with the physical mechanics of the brain and body—where does the ghost sit in his machine? Descartes decided that mind and body must interact somewhere and he selected the pineal gland (an apparently functionless part of the brain) as the spot. But this did nothing to explain how two *totally different* aspects of nature can possibly influence each other, and today most philosophers and psychologists reject dualistic views of life and personality as posing more problems than they solve. *See also* **Psychology, Occam's Razor**.

E

Ecumenism, a world movement which springs from the Christian belief that all men are brothers and that the Christian Church should be re-structured to give reality to the belief. Christ's church exists not to serve its own members, but for the service of the whole world. Some see the answer in a united church of a federal type (unity in diversity), others in an organic structure with one set of rules. The period since the convening of the Second Vatican Council by Pope John has been one of prolonged discussion among Christian theologians with the aim of promoting Christian unity.

Education. Education was no great problem to primitive man, but as societies became more complex people began to ask themselves such questions as: *What* should young people be taught? *How* should they be taught? Should the aim of their education be to bring out their individual qualities or rather to make them good servants of the state?

The first teachers were priests who knew most about the traditions, customs, and lore of their societies and thus the first schools were in religious meeting places. This was notably true of the Jews who learned from the rabbis in the synagogue.

The Greeks. We begin, as always, with the Greeks whose city-states, based on slavery, educated men (not women) for the sort of life described in Plato's *Dialogues*—the leisured life of gentlemen arguing the problems of the universe at their banquets or in the market-place. This made it necessary to learn debate and oratory (or rhetoric) especially for those who proposed to take up politics. The Sophist philosophy taught the need to build up convincing arguments in a persuasive manner, to learn the rules of logic and master the laws and customs of the Athenians, and to know the literature of the past so that illustrations might be drawn from it. These strolling philosophers who taught for a fee were individualists showing the student how to advance himself at all costs.

Socrates had a more ethical approach, believing that education was good in itself, made a man happier and a better citizen, and emphasised his position as a member of a group. His method of teaching, the dialectic or "Socratic" method, involved argument and discussion rather than overwhelming others by rhetoric and is briefly mentioned under **Dialectical Materialism** (*q.v.*). Today this method is increasingly used in adult education where a lecture is followed by a period of discussion in which both lecturer and audience participate; for psychologists have shown that people accept ideas more readily when conviction arises through their own arguments.

Socrates' pupil Plato produced in his book *The Republic* one of the first comprehensive systems of education and vocational selection. Believing that essentially men have very different and unequal abilities he considered that in an idealistic or utopian society they should be put into social classes corresponding to these differences, and suggested the following method: (1) For the first 18 years of a boy's life he should be taught gymnastics and sports, playing and singing music, reading and writing, a knowledge of literature, and if he passed this course sent on to the next stage; those who failed were to become tradesmen and merchants. (2) From 18–20 those successful in the first course were to be given two years of cadet training, the ones thought incapable of further education being placed in the military class as soldiers. (3) The remainder, who were to become the leaders of society, proceeded with advanced studies in philosophy, mathematics, science, and art. Such education was to be a state concern, state supported and controlled, selecting men and training them for service in the state according to their abilities.

Plato's pupil Aristotle even suggested that the state should determine shortly after birth which children should be allowed to live and destroy the physically or mentally handicapped; that marriage should be state-controlled to ensure desirable offspring. However, in their time the leisured and individualistic Sophists held the field and few accepted the educational views of Plato or his pupil.

Rome. The Romans were not philosophers and most of their culture came from Greece. Administration was their chief aptitude and Quintilian (A.D. *c.* 35–*c.* 95) based his higher education on the earlier classical tuition in public speaking, but he is important for emphasising the training of character and for his humanistic approach to the method of teaching that caused his *Institutio oratoria* to be influential for centuries later—indeed one might almost say up to the time of the great Dr. Arnold of Rugby. Education, he believed, should begin early but one must "take care that the child not old enough to love his studies does not come to hate them" by premature forcing; studies must be made pleasant and interesting and students encouraged by praise rather than discouraged when they sometimes fail; play is to be approved of as a sign of a lively disposition and because gloomy, depressed children are not likely to be good students; corporal punishment should never be used because "it is an insult as you will realise if you imagine it yourself". The world became interested not in *what* he taught but *how* he taught it; he was the pioneer of humanistic education and character-training from Vittorino d. Feltre (1378–1446) of Mantua, through Milton and Pope who commended his works to the modern educationists who have studied their pupils as well as their books.

The Middle Ages: *The Religious View*. With the development of Christianity education once more became a religious concern. The earliest converts had to be taught Christian doctrine and were given instruction in "catechumenal" schools before admission to the group, but as the religion came increasingly into contact with other religions or heresies a more serious training was necessary, and from these newer "catechetical" schools, where the method used was the catechism (*i.e.*, question and answer as known to all Presbyterian children today), the Apologists arose among whom were Clement of Alexandria and the great Origen. From this time education became an instrument of the church and in 529 the Emperor Justinian ordered all pagan schools to be closed.

As typical of the best in medieval education we may mention St. Benedict (*c.* 480-*c.* 547) of Monte Cassino. There, in southern Italy, a rule was established which became a part of monastic life in general. Monastic schools were originally intended for the training of would-be monks, but later others were admitted who simply wanted some education; thus two types of school developed one for the *interni* and the other for *externi* or external pupils. Originally studies were merely reading in order to study the Bible, writing to copy the sacred books, and sufficient calculation to be able to work out the advent of holy days or festivals. But by the end of the 6th cent. the "seven liberal arts" (grammar, rhetoric, dialectic, arithmetic, geometry, music, and astronomy) were added.

The Renaissance. The close of the Middle Ages saw the development of two types of secular school. One came with the rise of the new merchant class and the skilled trader whose "guilds" or early trade unions established schools to train young men for their trades but ultimately gave rise to burgher or town schools; the other was the court school founded and supported by the wealthy rulers of the Italian cities—Vittorio da Feltre (mentioned above) presided over the most famous at Mantua.

These Renaissance developments are parallelled in northern Europe by the Protestant reformers who, having with Martin Luther held that everyone should know how to read his Bible in order to interpret it in his own way, were logically committed to popular education, compulsory and universal. In theory this was intended for biblical study, but writing, arithmetic, and other elementary subjects were taught and Luther said that, even if heaven and hell did not exist, education was important. In this sense, universal education is a Protestant conception.

Hobbes and Locke. From this period onwards people were free to put forward any ideas about education, foolish or otherwise, and to create their own types of school. Of English philosophers who theorised about, but did not practise, education we may mention the rationalist Francis Bacon (1561–1626) who saw learning as the dissipation of all prejudices and the collection of concrete facts; the materialist and totalitarian Hobbes (1588–1679) who, as a royalist, believed that the right to determine the kind of education fit for his subjects is one of the absolute rights of the sovereign power or ruler; the gentlemanly Locke (1632–1704) whose ideal was a sound mind in a sound body to be attained by hard physical exercise, wide experience of the world, and enough knowledge to meet the requirements of the pupil's environment. The end result would be one able to get on with his fellows, pious but wise in the ways of the world, independent and able to look after himself, informed but reticent about his knowledge. Classics and religious study were not to be carried to excess, since Locke held that these subjects had been much overrated in the past.

Jean-Jacques Rousseau (1712–78), a forerunner of the Romantic movement (*q.v.*), which despised society and its institutions, put emotion at a higher level than reason. His book *Emile* describes the education of a boy which is natural and spontaneous. Society, he holds, warps the growing mind and therefore the child should be protected from its influences until his development in accordance with his own nature is so complete that he cannot be harmed by it. During the first 4 years the body should be developed by physical training; from 5 to 12 the child would live in a state of nature such that he could develop his powers of observation and his senses; from 13 books would be used and intellectual training introduced, although only in line with the child's own interests, and he would be given instruction only as he came to ask for it. Moral training and contact with his fellows to learn the principles of sympathy, kindness, and helpfulness to mankind would be given between 15 and 20. Girls, however, should be educated to serve men in a spirit of modesty and restraint. His own five children he deposited in a foundling hospital.

Summary. Broadly speaking, then, there have been four main attitudes to education: (1) religious, with a view to a life beyond death; (2) state-controlled education, with a view to uniform subservience to authority; (3) "gentlemanly" education, with a view to social graces and easy congress in company; (4) the "child-centred" education, which attempts to follow the pupil's inner nature. It is unnecessary to mention the ordinary method of attempting to instil facts without any considerable degree of co-operation between pupil and teacher in order that the former may, with or without interest, follow some occupation in adult life; for this the philosophers did not consider. Today there remain the two fundamental principles: education for the advantage of the state and its ideology or education for individual development and freedom.

Modern Educationalists. Four educationists of the modern period who have influenced us in the direction of freedom were Johann Pestalozzi of Switzerland (1746–1827) who, by trying to understand children, taught the "natural, progressive, and harmonious development of all the powers and capacities of the human being"; Friedrich Froebel (1782–1852) of Germany, the founder of the Kindergarten who, like Pestalozzi, was influenced by Rousseau but realised the need to combine complete personal development with social adjustment; Maria Montessori (1869–1952) whose free methods have revolutionised infant teaching; John Dewey (1859–1952) who held that the best interests of the group are served when the individual develops his own particular talents.

Egalitarianism. The doctrine that human beings are, in an important sense, equal and that it is desirable to remove inequalities by social and political means. It was part of the famous slogan of the French Revolution: "Liberty, Equality, Fraternity". There has been much debate, however, as to what extent human beings are, in fact, equal. Critics of equality as a political ideal argue that it conflicts with other more valuable ideals or social values, and that the different kinds of equality are not compatible.

Eid, the Muslim festival which celebrates the end of Ramadan (the fasting period). It is the holiest day in the Islamic calendar, marking the willingness of Abraham to sacrifice his son Isaac.

Eleatics, the philosophers of Elea in ancient Greece who, at the time when Heraclitus (*c.* 535–475 B.C.) was teaching that change is all that exists and nothing is permanent, were asserting that change is an illusion. Of the three leaders of this school, Xenophanes asserted that the universe was a solid immovable mass forever the same; Parmenides explained away change as an inconceivable process, its appearance being due to the fact that what we see is unreal; and Zeno (the best-known today) illustrated the same thesis with his famous argument of the arrow which, at any given moment of its flight, must be where it is since it cannot be where it is not. But if it is where it is, it cannot move, this is based, of course, on the delusion that motion is discontinuous.

Elitism. A political theory, largely drawn from the writings of V. Pareto (1848–1923). Power in a society will always be exercised by a minority (the elite) which takes the major decisions. An elite gains its dominant position through possessing certain resources or qualities valued in that particular society, *e.g.* priests or soldiers or senior state officials. Elites normally aim to continue their domination, but are not always capable of doing so and become displaced by another elite. If elite rule is inevitable then there can be no hope of an egalitarian, socialist society. This analysis of the importance of elites has been very influential. Some sociologists have extended the theory in recent years to argue that in all developed countries there is a plurality of competing elites within different systems of control. Such systems are politics, trade union organisations, cultural and educational institutions.

Empiricism. While not a single school of philosophy, empiricism is an approach to knowledge which holds that if a man wants to know what the universe is like the only correct way to do so is to go and look for himself, to collect facts which come to him through his senses. It is, in essence, the method of science as contrasted with rationalism (*q.v.*) which in philosophy implies that thinking or reasoning without necessarily referring to external observations can arrive at truth. Empiricism is typically a British attitude, for among the greatest empirical philosophers were John Locke, George Berkeley, and David Hume. *See* **Rationalism**.

Encyclopedists. The writers (all men) who contributed to the *Encyclopedie* published in France from 1751 to 1772. The work's full title was *Encyclopedie, ou dictionnaire raisonne des sciences, des arts et des metiers.* It was designed as a synoptic description of all branches of human knowledge, and is perhaps the most characteristic work of the Enlightenment (*q.v.*). The *Encyclopedie* was inspired by Chambers' *Cyclopedia, or a universal dictionary of arts and sciences* published in London in 1728. The project began in 1745, with Denis Diderot and Jean d'Alembert as editors. The latter resigned in 1758, leaving Diderot to shoulder most of the work. In 1772 the project reached 28 volumes; between 1776 and 1780 7 supplementary volumes were published.

Besides Diderot and d'Alembert and many obscure writers, Voltaire, Rousseau and d'Holbach contributed. The work was a showcase for representatives of new schools of thought in all branches of intellectual activity. The work was tolerant, liberal, and also innovative in giving attention to trades and mechanical arts. In its scepticism, its emphasis on being scientific, and its criticism of superstition and contemporary social institutions, the *Encyclopedie* had immense influence.

Enlightenment. A European intellectual movement of the 18th century. Enlightenment thinkers aimed to bring clarity, order and reason, in a word, *light* to regions where formerly there had been mystery, superstition and blind authority, that is, darkness. Man would become enlightened by knowledge and progress to greater happiness and freedom. The movement affected the arts, the sciences, political and social life.

The Enlightenment was prepared by the rise of science from the 16th century on. In particular, the success of Newton (1642–1727) in encapsulating the laws that govern the motion of the planets gave great hopes in man's capacity to attain extensive understanding. According to the German philosopher Kant (1724–1804) the motto of the Enlightenment was "Have courage to use your own understanding". Scientific knowledge was the ideal. If something was held to be true, it had to be based on dispassionate rational investigation. This overrode any claim to knowledge based on authority. One great source of authority was the Christian church, which was widely criticised by Enlightenment thinkers (*e.g.* in Voltaire's *Candide*); another was the despotism and arbitrary power of many states at the time. Although there is now a tendency to be sceptical about the Enlightenment and the power of reason, the belief in human progress through increased knowledge has been one of the most powerful of all ideas.

Epicureanism. The two great schools of the Hellenistic period (*i.e.* the late Greek period beginning with the empire of Alexander the Great) were the Stoics and Epicureans, the former founded by Zeno of Citium (not to be confused with Zeno the Eleatic) (*q.v.*), the latter by Epicurus, born in Samos in 342 B.C.

Both schools settled in Athens, where Epicurus taught that "pleasure is the beginning and end of a happy life." However, he was no sensualist and emphasised the importance of moderation in all things because excesses would lead to pain instead of pleasure and the best of all pleasures were mental ones. Pleasures could be active or passive but the former contain an element of pain since they are the process of satisfying desire not yet satiated. The latter involving the absence of desire are the more pleasant. In fact, Epicurus in his personal life was more stoical than many Stoics and wrote "when I live on bread and water I spit on luxurious pleasures." He disapproved of sexual enjoyment and thought friendship one of the highest of all joys.

A materialist who accepted the atomic theory of Democritus, he was not a determinist, and if he did not dis-believe in the gods he regarded religion and the fear of death as the two primary sources of unhappiness.

Epiphenomenalism. *See* **Mind and Body.**

Erastianism, the theory that the state has the right to decide the religion of its members, wrongly attributed to Erastus of Switzerland (1524–83) who was believed to have held this doctrine. The term has usually been made use of in a derogatory sense–*e.g.*, by the Scottish churches which held that the "call" of the congregation was the only way to elect ministers at a time when, about the turn of the 17th and 18th cent., they felt that Episcopalianism was being foisted on them. "Episcopalianism" (*i.e.* Anglicanism) with its state church, ecclesiastical hierarchy, and system of livings presented by patrons was to them "Erastian" in addition to its other "unscriptural practices."

Essenes, a Jewish sect which, during the oppressive rule of Herod (d. 4 B.C.), set up monastic communities in the region of the Dead Sea. They refused to be bound by the scriptural interpretations of the Pharisees and adhered rigorously to the letter of Holy Writ, although with additions of their own which cause them by orthodox Jews today to be regarded as a break-away from Judaism. Among their practices and beliefs were purification through baptism, renunciation of sexual pleasures, scrupulous cleanliness, strict observance of the Mosaic law, communal possession, asceticism.

Akin in spirit, though not necessarily identical with them, were the writers of Apocalyptic literature preaching that the evils of the present would shortly be terminated by a new supernatural order heralded by a Messiah who would reign over a restored Israel. The casting out of demons and spiritual healing formed part of these general beliefs which were in the air at that time. The sect has an importance far beyond its size or what has been known about it in the past since the discovery from 1947 onwards of the Dead Sea Scrolls of the Qumran community occupying a monastery in the same area as the Essenes and holding the same type of belief.

These scrolls with their references to a "Teacher of Righteousness" preceding the Messiah have clear relevance to the sources of early Christianity and have given rise to speculations as to whether Jesus might have been influenced by views which, like His own, were unacceptable to orthodox Jews but in line with those of the Dead Sea communities. Some scholars now think that early Christianity was not a sudden development but a gradual one which had its predecessors. A recent view suggests that the Essenes may not have existed as a sect at all.

Ethical Church, a movement typical of 19th cent. rationalism which attempted to combine atheism (or at any rate the absence of any belief in a God which was inconsistent with reason or based on revelation) with the inculcation of moral principles. Prayers were not used and ordinarily the service consisted in the singing of edifying compositions interspersed with readings from poems or prose of a similar nature by great writers holding appropriate views. It terminated in a talk on an ethical or scientific theme. Conway Hall (built 1929) in Red Lion Square, London, belongs to the South Place Ethical Society, founded by Moncure Conway who preached at their Unitarian chapel in South Place, Finsbury, 1864–97.

Eugenics, a 19th-cent. movement largely instigated by the British scientist and mathematician, Sir Francis Galton. Galton argued that many of the most satisfactory attributes of mankind—intelligence, physical strength, resistance to disease, *etc.*—were genetically determined and thus handed down in the normal process of inheritance. From this he reasoned that selective mating of physical "superior" individuals, and its converse, the controlled limitation on the breeding of criminals or the insane, would lead inevitably to a progressive improvement in the overall standards of the human race. In their simplest form these proposals are incontestable, though they do of course introduce marked restrictions on the choice of the individual for marriage and procreation. Even worse is the way in which the argument can be misapplied as in Nazi Germany to include the sterilisation of alcoholics, criminals and even epileptics.

In 1997 it was revealed that extensive sterilisation of mentally-handicapped people had been carried out until the 1970s in Norway and Switzerland.

Euthanasia (mercy killing), the term applied to the painless killing of those (especially the old) suffering from unbearable pain and an illness for which there is no cure. In Britain, attempts in Parliament to introduce its legalisation have failed but in 1993 Holland voted to tolerate euthanasia governed by tight guidelines. Under these procedures, euthanasia is tolerated when the patient is conscious, suffers an incurable disease paired with intolerable pain and clearly requests a "soft death". The World Right to Die Organisation has thriving branches world-wide.

Legislation permitting voluntary euthanasia was passed in the Northern Territory of Australia in 1995 and the world's first legal euthanasia took place in 1996. In 1997 the Liberal Democrats became the first major party in Britain to debate the issue and there is increasing pressure in the UK for reform of the law to make it legal to assist a terminally ill person if they wish to die (currently euthanasia and assisted suicide are illegal in the UK). In 2009 Debbie Purdy (a multiple sclerosis sufferer) won a landmark case when told she was right to demand a written set of criteria outlining when someone might be prosecuted for helping a loved one die abroad.

In 2001 the Dutch government decriminalised mercy killing by passing new legislation. Belgium followed the Dutch example in May 2002. Luxembourg legalised euthanasia in 2010. Switzerland also allows assisted suicide for the terminally ill. France is following a similar path (and euthanasia is legal in Canada since 2016). India has also ruled (in 2011) that life support may legally be withdrawn from some patients. In 2014 Belgium became the first country to allow terminally-ill children to end their lives.

In Britain the landmark report in 2011 of the Commission on Assisted Dying gave strong support to an assisted death in certain circumstances. However, an Assisted Dying Bill was rejected in the House of Commons in September 2015 by 330 votes to 118.

Euthanasia is the biggest bioethical issue of our time. Reform of the law is now being sought in Parliament by such groups as Dignity in Dying.

Evangelicalism, the belief of those Protestant sects which hold that the essence of the Gospel consists in the doctrine of salvation by faith in the atoning death of Christ and not by good works or the sacraments; that worship should be "free" rather than liturgical through established forms; that ritual is unacceptable and superstitious. Evangelicals are Low Churchmen. Nowadays, a new breed of evangelical Christianity is flourishing as a result of the Alpha course and the conservative Reform group. They have a powerful ally in the hardline Anglican Church in Africa.

Evangelism, the preaching of the Gospel, emphasising the necessity for a new birth or conversion. The evangelistic fervour of John Wesley and George Whitefield (*see* Methodism) aroused the great missionary spirit of the late 18th and 19th cent. George Fox, founder of the Society of Friends (*q.v.*), was also an evangelist. Evangelists can be Low, High, or Middle Churchmen.

Evolutionary Psychology, an approach that aims at understanding the relationship between psychological processes, behaviours and the evolutionary mechanisms that have shaped human physiology. It studies the ways in which the survival value of certain behaviours and cognitive abilities may have resulted in current human psychology.

Existentialism, a highly subjective philosophy which many people connect with such names as Jean-Paul Sartre (1905–80) or Albert Camus (1913–60) and assume to be a post-war movement. However, existentialism stems from Sören Kierkegaard (1813–55), the Danish "religious writer"—his own description of himself—in such works as *Either/Or*, *Fear and Trembling*, and *Concluding Unscientific Postscript*. Between the two world wars translations of Kierkegaard into German influenced Martin Heidegger's great work *Being and Time* and the other great existentialist Karl Jaspers; it has strongly influenced modern Protestant theology notably in Karl Barth, Reinhold Niebuhr, and Paul Tillich and beyond that field the French philosopher Gabriel Marcel, the Spanish writer Unamuno in his well-known *The Tragic Sense of Life*, and Martin Buber of Israel in his *I and Thou*. We have it on Heidegger's authority that "Sartre is no philosopher" even if it is to his works that modern existentialists often turn.

Existentialism is extremely difficult for the non-metaphysically-minded to understand, it deals, not with the nature of the universe or what are ordinarily thought of as philosophical problems but describes an attitude to life or God held by the individual. Briefly, its main essentials are: (1) it distinguishes between *essence*, *i.e.*, that aspect of an entity which can be observed and known—and its *existence*—the fact of its having a place in a changing and dangerous world which is what really matters; (2) existence being basic, each self-aware individual can grasp his own existence on reflection in his own immediate experience of himself and his situation as a free being in the world; what he finds is not merely a knowing self but a self that fears, hopes, believes, wills, and is aware of its need to find a purpose, plan, and destiny in life; (3) but we cannot grasp our existence by thought alone; thus the fact "all men must die" relates to the essence of man but it is necessary to be involved, to draw the conclusion as a person that "I too must die" and experience its impact on our own individual existence; (4) because of the preceding, it is necessary to abandon our attitude of objectivity and theoretical detachment when faced by the problems relating to the ultimate purpose of our own life and the basis of our own conduct; life remains closed to those who take no part in it because it can have no significance; (5) it follows that the existentialist cannot be rationalist in his outlook for this is merely an escape into thought from the serious problems of existence; none of the important aspects of life—failure, evil, sin, folly—nor (in the view of Kierkegaard) even the existence of God or the truth of Christianity can be proved by reason. "God does not exist; He is eternal," was how he expressed it; (6) life is short and limited in space and time, therefore it is foolish to discuss in a leisurely fashion matters of life and death as if there were all eternity to argue them in. It is necessary to make a leap into the unknown, *e.g.*, accepting Christ (in the case of the Christian existentialist) by faith in the sense of giving and risking the self utterly. This means complete commitment, not a dependence on arguments as to whether certain historical events did, or did not, happen.

To summarise: existentialism of whatever type seems to the outsider to be an attitude to life concerning itself with the individual's ultimate problems (mine, not yours); to be anti-rationalist and anti-idealist (in the sense of being, as it seems to the believer, practical)—in effect it seems to say "life is too short to fool about with argument, you must dive in and become committed" to something. Sartre who called himself an "atheist existentialist" was apparently committed to the belief that "hell is other people," but for most critics the main argument against existentialism is that it often rests on a highly specialised personal experience and, as such, is incommunicable.

Existential Psychology, a rather diffuse movement in modern psychology with no specific founder but with a number of figures who, perhaps against their will, acquired leader status. One of the key figures was the British psychiatrist, R. D. Laing (1927–89), whose radical views on psychotherapy were counted as being heretical by the vast majority of his medical colleagues. Laing held that many so-called neurotic and psychotic conditions are essentially not "abnormal" but represent strategies by which an individual may adjust to environmental and personal stress.

Instead of attempting to suppress or eliminate the psychosis in the traditional manner, one should lead the patient through it thus allowing the individual's "unconscious plan" for his own adjustment to be fulfilled.

Exorcism, the removal or ejection of an evil spirit by a ritual or prayer.

F

Fabian Society. The Fabian Society was founded in 1884 with the conviction that social change could be brought about by gradual parliamentary means. (The name is derived from Quintus Fabius Maximus, the Roman general nicknamed "Cunctator," the delayer, who achieved his successes in defending Rome against Hannibal by refusing to give direct battle.) It was a movement of brilliant intellectuals, chief among whom were Sidney and Beatrice Webb, H. G. Wells, G. B. Shaw, Graham Wallas, Sidney Olivier, and Edward Pease. The Society itself was basically a research body which furnished the intellectual information for social reform and supported all contributing to the gradual attainment by parliamentary means of socialism.

The Webbs's analysis of society emphasised that individualist enterprise in capitalism was a hang-over from early days and was bound to defeat itself since socialism is the inevitable accompaniment of modern industrialism; the necessary result of popular government is control of their economic system by the people themselves. Utopian schemes had been doomed to failure because they were based on the fallacy that society is static and that islands of utopias could be formed in the midst of an unchanging and antagonistic environment. On the contrary, it was pointed out, society develops: "The new becomes old, often before it is consciously regarded as new." Social reorganisation cannot usefully be hastened by violent means but only through methods consonant with this natural historical progression—gradual, peaceful, and democratic. The Fabians were convinced that men are rational enough to accept in their common interest developments which can be demonstrated as necessary; thus public opinion will come to see that socialisation of the land and industries is essential.

The Society collaborated first in the formation of the Independent Labour Party and then with the more moderate Labour Party and the trade unions and Co-operative movement. But in general it disapproved of independent trade union action since change should come from the government and take political form. The class-war of Marx was rejected and so too was the idea of the exclusive role of the working class—reform must come from the enlightened co-operation of all classes.

Faith Healing, the belief and practice of curing physical and mental ills by faith in some supernatural power, either allegedly latent in the individual or drawn in some way from God.

Falangists. The Fascist Party of Spain founded in 1933 by José Antonio Primo de Rivera, son of the man who was dictator of the country from 1923 to 1930. The Falange was the only political party allowed in Spain during the Franco era. *See* **Fascism** (*below*).

Falun Gong (**Falun Dufa**), Chinese mystic healing movement, prosecuted by the Beijing government as an 'evil and dangerous cult'. Led by the US-based Li Hongzhi, it is banned in China. The movement, with *c.* 80 million members, is based on the ancient mystical and healing principles of *qigong*. First introduced to the public in China in 1992. Many Falun Gong supporters are in forced labour camps and have suffered torture.

Fascism flourished in countries where the values and institutions of liberal democracy were weak and ineffective, and where political crisis was inflamed by economic calamity. Following defeat in World War I, Germany was stripped of territory and military capacity, and was subject to hefty financial repayments to the victorious powers for the costs of war. The fragile liberal democracy in Germny after 1918 suffered terrible economic shocks resulting in hyperinflation and mass unemployment; Germany significantly failed to entrench stable democratic government.

Fascist parties organised around a fight against the perceived causes of their national crises and found common enemies in communists, trade unionists, liberal democrats, and Jews. Fascists declared that these were corruptions of the authentic will and purity of their nations, and promoted action, conflict, and violence to eradicate these enemies. Fascist movements were highly organised, and hierarchical with charismatic authoritarian leaders.

Italian Fascism. The corporate state set up by Benito Mussolini in Italy claimed to be neither capitalist nor socialist, and after its inception in 1922 the Fascist Party became the only recognised one. Its members wore black shirts, were organised in military formations, used the Roman greeting of the outstretched arm, and adopted as their slogan "Mussolini is always right". Membership of the Party was not allowed to exceed a number thought to be suited to the optimum size of a governing class and new candidates were drawn, after strict examinations, from the youth organisations. The Blackshirts, a fascist militia, existed separately from the army and were ruled by Fascist Headquarters.

At the head of government was Mussolini, "Il Duce" himself, a cabinet of fourteen ministers selected by him and approved by the King to supervise the various functions of government, and the Grand Council or directorate of the Fascist Party, all the members of which were chosen by the Duce. Parliament, which was not allowed to initiate legislation but only to approve decrees from above, consisted of a Senate with life-membership and a Chamber of Fasci and Corporations composed of nominated members of the Party, the National Council of Corporations, and selected representatives of the employers' and employees' confederations. Private enterprise was encouraged and protected but rigidly controlled; strikes were forbidden, but a Charter of Labour enforced the collaboration of workers and employers whose disputes were settled in labour courts presided over by the Party.

All decisions relating to industry were government-controlled (*e.g.*, wages, prices, conditions of employment and dismissal, the expansion or limitation of production), and some industries such as mining, shipping, *etc.* were state-owned.

Italian fascism served as a model in other countries, notably for the German National Socialist Party and in Spain and Japan.

Fascism in Britain. Most European nations between the wars had their small Fascist parties, the British version led by Sir Oswald Mosley. In 1932 Mosley's earlier New Party changed its name to the British Union of Fascists (BUF), adopting uniforms and mass rallies. The BUF urged a radical economic programme to solve the problem of unemployment. The violence of Mosley's supporters towards their opponents at the Olympia Meeting of June 1934, however, alienated public opinion. A series of provocative marches through Jewish districts in London led to clashes between the police and anti-fascist demonstrators, notably at Cable Street in October 1936, leading to the Public Order Act. In May 1940 Mosley and other leading members were detained under the Emergency Powers Defence Regulations and in July the British Union was banned.

German Fascism (**Nazism**) was led by Adolf Hitler's National Socialist German Workers Party (Nazi Party). Hitler emulated the early successes of Mussolini's Italian fascists, but emphasised the racial nature of the German nation. Hitler's Nazis were distinguished by an aggressive anti-Semitism, and a voracious pursuit of *Lebensraum* – a massive German empire, particularly to the east, that could support a 'purified' racial state. Hitler's Nazis pursued their racial fascist ideology by invading Poland, France, Belgium, Denmark, Holland, Yugoslavia, Greece, and Russia. Each military invasion was followed by a political and racial purge organised by the SS. Jews were forced into ghettos, and the Nazis established a system of concentration camps across Europe. Prisoners of these camps were often forced to labour for the Nazi war effort. The Nazis used these camps to enforce their racial ideology of purification, and systematically murdered over 5 million Jews and members of other groups such as political opponents, homosexuals, gypsies, and disabled people. This murderous legacy is remembered as the Holocaust. The exact number of victims of the Holocaust will never be known.

Spanish Fascism. Fascism in Spain developed through the Falange party that fought in the Spanish Civil War with the material support of the fascist governments of Italy and Germany. The Falangists eventually seized power in 1939, when Francisco Franco Bahamonde (1892–1975) became leader of the Falange and Spain. Franco's fascism shared many of the characteristics of the Italian and German movements but also integrated the support of Roman Catholicism. Franco's fascist government persisted until 1975, after which Spain adopted a constitutional monarchy, and the Falange suffered a heavy defeat in democratic elections in 1977.

Neofascism. Although in a sense fascism ended with the defeat of Germany in 1945 there have been persistent revivals in Italy, France, in

Germany following reunification, and in Russia and the Balkans after the collapse of Communism.

Modern fascist parties, the British National Party in Britain, the Freedom Party in Holland, or the National Front in France (now led by Marine Le Pen), concentrate more on the tensions caused by mass immigration into their countries, the arrival of asylum seekers and the onset of Islamic fanaticism. Russian Fascists attack their minorities (especially Muslims).

Fatalism. *See* **Determinism**.

Federalism, belief in the desirability of a political unit consisting of several smaller units, usually termed states, involving a central government and regional or state governments. The states or provinces devolve certain powers over themselves and their citizens to the larger unit, such powers being embodied in a written constitution which can only be amended with the consent of a fixed percentage of the states. The constitution specifies the powers devolved to the federal or central government and the restrictions placed on its interference in the internal affairs of the states.

Given the possibility of disputes as to the spheres of competence of federal and state governments, machinery such as a 'supreme court' is established to interpret the constitution. Examples of federations are the USA, Canada and India. *See also* **World Federalism**.

Federalists. US party which in the early days of American independence in the late 18th century, favoured a concentration of power in the central government. Their opponents, the anti-federalists (later the Democrats) were supporters of the rights of individual states.

Feminism. Feminism is an expression which emerged in the mid-19th century. It is an international movement (there was, for example, a feminist congress in Paris in 1890), which aimed at ending female inequality in male-dominated societies. In early 20th century Britain feminism sought political advance through a militant campaign for women's suffrage, This, and the part played by women in World War One, made it impossible for a male elite to deny women the right to vote. But in each country it became increasingly clear to women that the political process alone left many of their needs unsatisfied, if not unrecognised. However, in post-World War Two Britain, legislation made a gesture towards outlawing discrimination against women at work with the 1970 Equal Pay Act and the 1975 Sex Discrimination Act.

Women's Liberation Movement. This activist feminism of the 1960s and 1970s (primarily in America and Europe as well as Britain), centred on questions of sexuality and the right of women to make choices, for example, over when (and whether) to become pregnant. The contraceptive pill appeared to open up sexual choice for women and to liberate them from traditional responsibilities for home, family and the welfare of children. In practice, it appeared to many women that the pill (as well as having physical side-effects) merely relieved men from a recognition of their own responsibility. The 1967 Abortion Act in Britain implied an acceptance of a woman's right to control her own reproduction, a right which has been systematically but unsuccessfully challenged since.

As western economies faltered in the late 1970s a recurring problem for the movement was consolidating the small gains that had been made. But the women's movement achievements cannot be measured by tangible results alone. A central aspect of the movement was "consciousness-raising", helping women recognise the social roots of their individual oppression.

Friedan and Greer. In their analysis of sexual stereotyping, late 20th century feminist writings—for example, Betty Friedan's *The Feminine Mystique* (1963) and Germaine Greer's *The Female Eunuch* (1970) encouraged a change in some women's expectations. These writers, and many like them, enabled a new generation of women to challenge the dominant decision-making role of men and to demand acceptance of the principle of equality between the sexes. Dale Spender's *Man Made Language* (1980) pointed to the ways in which the "sexist" structure of language internalised the perpetuation of male dominance. A simple, but not superficial, result of this is the acceptance of the abbreviation "Ms" rather than "Mrs" or "Miss" on the grounds that the latter presupposed that a woman's identity depended on her marital status.

Although feminism as a movement was loosely structured—there were, for example, early on, differing emphases between socialists, black women, working class women, and lesbians, based on their own experiences—the movement became increasingly fragmented during the 1980s. Some women, who were now building individual careers, distanced themselves from agitation and thought little more could be achieved by collective action. Single-issue pressure groups evolved, focusing on campaigns for change in particular areas.

The Greenham Common Women's Peace Camp which began in the mid-1980s as a protest against the deployment of Cruise missiles in Britain, was able to develop from this into an exemplary feminist action which reverberated internationally. Self-organisation among miners' wives in the 1984–85 strike proved similarly effective.

The irony of "classical" feminism is that it became a concern of the generation that came to maturity in the late 1960s. Their children—and their younger sisters—had absorbed the earlier failures and successes and moved on. By the 1990s, for what became the older generation, there was a view that the earlier movement had implanted unrealistic expectations in women (particularly those with domestic responsibilities), the "double burden" of maintaining a career and home. This led at a time of growing recession and unemployment to an anti-feminist campaign or "backlash", not only among men (which was to be expected) but also among some women who described themselves as post-feminists. Susan Faludi, speaking for a younger generation in *Backlash: The Undeclared War Against Women* (1991) documents a process which attempted to force women back into the home and a return to "traditional" family life.

However, a significant recognition of the altered balance between the sexes came with the 1991 House of Lords decision that rape within marriage was an offence. The mid-1990s saw a new emphasis placed by political parties on the role of the family and its reputed breakdown as the root of many of the problems confronting Western society. This was interpreted by some as an attempt to reverse the social and economic advances achieved by some women in the past half century. Working mothers, for example, were accused of neglecting their prime duty as homemakers, although the research evidence presented was often contradictory.

The new century has seen feminists trying to come to terms with a multicultural society in which the traditional role of women is unacceptable to them.

Feng Shui, a Chinese philosophy whose basic principles seek to change the environment with colours, objects and placement of furniture to counteract negative energy and aid a flow of positive energy.

Fetichism, originally a practice of the peoples of West Africa and elsewhere of attributing magical properties to an object which was used as an amulet, for putting spells on others, or regarded as possessing dangerous powers. In psychology the term refers to a sexual perversion in which objects arouse sexual excitement.

Feudalism. The feudal system took its origins from Saxon times and broadly speaking lasted until the end of the 13th cent. It was a military and political organisation based on land tenure, for, of course, society throughout this period was based almost entirely on agriculture. The activities of men divided them into three classes or estates. The First Estate was the clergy, responsible for man's spiritual needs; the Second was the nobility, including kings and emperor as well as the lesser nobles; the Third was composed of all those who had to do with the economic and mainly agricultural life of Europe. The praying men, the fighting men and administrators, and the toilers were all held to be mutually dependent on each other.

The theory of feudalism, although it by no means always worked out in practice, was as follows: the earth was God's and therefore no man owned land in the modern sense of the word. God had given the pope spiritual charge of men, and secular power over them to the emperor from whom kings held their kingdoms, and in turn the dukes and counts received the land over which they held sway from the king. Members of the Second Estate held their lands on the condition of fulfilling certain obligations to their overlord and to the people living under them, so when a noble received a fief or piece of land he became the vassal of the man who bestowed it. To him he owed military service for a specified period of the year, attendance at court, and giving his lord counsel. He undertook to ransom his lord when he fell into enemy hands and to contribute to his daughter's dowry and at the knighting of his son. In return the lord offered his vassal protection and justice, received the vassal's sons into his household and educated them for knighthood.

The system was complicated by the fact that large fiefs might be subdivided and abbots often governed church lands held in fief from nobles. The serf or toiling man dwelt on the land of a feudal noble or churchman where he rendered service by tilling the soil or carrying out his craft for his manorial lord in return for protection, justice, and the security of his life and land. He was given a share in the common lands or pastures from which he provided for his own needs. In the modern sense he was not free (although at a later stage he could buy his freedom) since he was attached to the soil and could not leave without the lord's permission. On the other hand he could neither be deprived of his land nor lose his livelihood.

Feudal tenures were finally abolished in England by statute in 1660, although they had long been inoperative.

In Japan a feudal system existed up to 1871, in Russia it lasted until 1917.

Fideism. Religious doctrines which hold that the intellect or reason of man is incapable of attaining knowledge of divine matters and that religious faith is the way to truth.

Flying Saucers. In June 1947 a US private pilot, Kenneth Arnold, reported seeing a series of wingless objects flying through the air at a speed which he estimated at thousands of miles an hour. The UFO phenomenon had been born.

A CIA report in 1997 confirmed that over half of all the UFO sightings were actually American spy planes on secret missions (most UFO sightings happened during the paranoia of the Cold War). The advent of the new century has consigned UFOs to history and in 2009 the Ministry of Defence ended all official investigations into UFOs.

Fourierism *See* **Utopianism.**

Freegan Movement. Freegans are those who try not to interact with the economy. They may live in squats, forage for food, *etc.* Freeganism inspired the US anti-capitalist group Food Not Bombs.

Freemasonry, a widespread, influential secret organisation of English origin. Although it can be traced back to the Middle Ages when itinerant working masons in England and Scotland were organised in lodges with secret signs for the recognition of fellow-members, modern freemasonry first arose in England in the early decades of the 18th cent. On 24 June 1717 four London lodges came together at the Goose and Gridiron Ale House in St Paul's Churchyard to form the first Grand Lodge in the world. Freemasons' Hall opened in 1776.

With its clubs for discussion and social meetings (women were excluded) it met a need and became a well-known feature of English life. The movement quickly spread abroad to places which had direct trade links with England. There are now around 200,000 Freemasons in some 8,000 Lodges in England and Wales. Globally, there are around 6 million members. The graded lodge structure, the prestige conferred on members, the symbolism, ritual and ceremony, and the emphasis on mutual help had a lasting appeal. Many establishment figures were members, such as Churchill, the Duke of Wellington and Lord Kitchener.

Membership used to bring definite business and social advantages, particularly in small communities where the leading middle- class figures were generally members. Recently this advantage has markedly declined and freemason lodges nowadays tend to be little more than worthy charitable organisations. Indeed, hundreds of masonic lodges faced closure because of a drastic membership decline. Very few members are under 30. Fear of secret societies has given freemasonry many opponents; it was condemned by the Roman Catholic Church, banned by Fascist dictators, and denounced by the Comintern. A statement from the Congregation for the Doctrine of the Faith in 1981 reminded Catholics that under Article 2335 of the Code of Canon Law they are forbidden under pain of excommunication from joining masonic or similar associations.

Recently, there have been calls for Freemasons who are members of, for example, the judiciary to declare their membership openly.

Freudian theory. *See* **Psychoanalysis.**

Friends, The Society of. *See* **Quakers.**

Fundamentalism originated in 19th century America as an opposition to the liberalising trend in theological practice. Fundamentalists rejected the attempt to interpret ancient scripture to make it more relevant to modern society, and argued for a return to a literal reading of the Bible. In the 1960s, such Christian fundamentalists, repulsed by the breakdown in traditional moral and social practices, began organising politically. Groups such as the Christian Coalition and the Moral Majority became powerful within American politics, and campaigned against abortion and gay rights.

The label has now been attached to many other groups who also oppose modern liberal social and political values, and who appeal to a strict literal reading of religious texts or moral values. Such wide usage is probably unhelpful as it may include fundamentalist Muslims inspired by the ideology of Sayyid Qutb (such as Osama Bin Laden) or the so-called Islamic State.

G

Game Theory, an approach to understanding human and animal behaviour which takes the view that psychological insight is best gained by studying the decisions which all living things make constantly and which govern the course of their lives. It proposes that life is basically a strategic game following complex rules which can probably only be understood by a study of the "decision units" as and when they occur. Because one is dealing with highly variable animals controlled by highly complex brains, and not with simple clockwork or electro-mechanical systems, the study of the rules which operate in the game of life is enormously complicated and thus game theory has quickly taken off into advanced mathematics. Game theory, incidentally, can be used to apply to individual action or to the behaviour of groups.

Gay and Lesbian Movement, term for the campaign to remove legal and other discrimination from gay men and lesbian women and to allow them to lead their lives to the full in our society. Its first large-scale manifestation was in America in the 1970s, paralleled in Britain with organisations such as the Gay Liberation Front.

Although, sadly, much discrimination remains, many people now accept that the sexual orientation of a person should not be a ground for any form of discrimination. Issues such as gay priests, and the onset of AIDS, have continued to ensure that "gay rights" remains a controversial area. In a vote in the Commons in March 1999 on the question of equalising the age of consent (there was then a higher minimum age of consent for male homosexual acts than for heterosexual) a majority of 281 to 82 was in favour, but the House of Lords again rejected the reform in April 1999. Eventually the law was changed in December 2000. Gay people have often received support from the European Court of Human Rights.

New legislation has aimed to remove existing laws against anal intercourse, gross indecency and discrimination at work as well as giving new legal rights to gay couples (so they have the same rights—and responsibilities—as heterosexual couples). Controversy over appointing gay priests as bishops still divides the Anglican Church.

In Holland, the Dutch Senate has legalised same sex marriages and given such couples the right to adopt Dutch children. Other countries (such as Sweden and Belgium) have followed. In

London, the GLA set up a London Partnerships Register in September 2001 for the official registration of same sex relationships. Adoption by gay couples became legal in Britain in 2002. Under the Civil Partnership Act, effective from December 2005, gay couples can enter into 'civil partnership registrations' at register offices. Parts of America (*e.g.* Texas) remain strongly against any form of gay partnerships and the issue is highly controversial. This was all changed in 2015 when the Supreme Court declared marriage a universal right. In 2009 an Indian court ruled that consensual gay sex is not a crime – overturning an 150-year old ban. However, this was itself overruled in 2013. Argentina became the first South American country to legalise same-sex marriages, now followed by Brazil, Chile, Uruguay and Colombia.

South Africa became the fifth nation in the world to authorise same-sex marriages (behind the Netherlands, Belgium, Spain and Canada). Same-sex marriage are now legal in New Zealand and France. Others (such as Ireland and Vietnam) have followed. It is still unlawful in Northern Ireland because of Democratic Unionist opposition.

In February 2013 the House of Commons voted strongly in favour of The Marriage (Same Sex Couples) Bill. This is now law and the first marriages took place on 29 March 2014. Scotland has followed suit.

In some countries, such as Russia Uganda and Nigeria homophobia is rife and attacks on gays are common. Same-sex activity is illegal in 76 countries (37 of them in Africa) and punishable by death in such countries as Afghanistan, Brunei, Sudan and Yemen.

Gestalt Psychology. In the latter half of the 19th cent. it became evident to psychologists that in principle there was no good reason why "mental" events should not be just as measurable and manageable as "physical" ones. Intensive studies of learning, memory, perception, and so on were therefore undertaken and the beginings of an empirical science of psychology were underway.

In the early 20th cent. the experiments of Pavlov (*see* **Behaviourism**) and his co-workers suggested that the behaviour of an animal, or even men, might ultimately be reduced to a descriptive account of the activities of nervous reflex loops—the so-called conditioned reflexes.

With the subsequent publication of Watson's important book on Behaviourism in 1914 it looked as though the transfer of psychological studies from the field of philosophy to that of science could now take place. Actually the picture of cerebral and mental pictures which Behaviourism offered was too simple.

Just as Behaviourism implied that there was a fundamental building block (the conditioned reflex) from which all mental events could be constructed, so Victorian physics assumed that the entire universe could be described in terms of a vast collection of atoms pushing each other around like billiard balls. The development of nuclear physics was to shatter the latter dream and at the same time a challenge to the naive "reflex psychology" came from the Gestalt experimental school.

The founders of this school were Max Wertheimer, Kurt Koffka and Wolfgang Köhler, three young psychologists who in 1912 were conducting experiments—notably in vision— which seemed to expose the inadequacies of the behaviourist position. The Pavlov-Watson view, as we have said, implied that complex sensory events were no more than a numerical sum of individual nervous impulses. Wertheimer's group proposed that certain facts of perceptual experiences (ruled out of court as subjective and therefore unreliable by Watson) implied that the whole (*Gestalt*) was something more than simply the sum of its parts. For example, the presentation of a number of photographs, each slightly different, in rapid series gives rise to cinematographic motion. In basic terms, the eye has received a number of discrete, "still" photographs, and yet "motion" is perceived. What, they asked, was the sensory input corresponding to this motion? Some processes within the brain clearly *added* something to the total input as defined in behaviourist terms.

An obvious alternative—in a different sense modality—is that of the arrangement of musical notes. A cluster of notes played one way might be called a tune; played backwards they may form another tune, or may be meaningless. Yet in all cases the constituent parts are the same, and yet their relationship to one another is evidently vital. Once again the whole is more than the sum of the parts.

The implications of all this appeared to be that the brain was equipped with the capacity to organise sensory input in certain well-defined ways, and that far from being misleading and scientifically unjustifiable, human subjective studies of visual experience might reveal the very principles of organisation which the brain employs. Take a field of dots, more or less randomly distributed; inspection of the field will soon reveal certain patterns or clusters standing out—the constellations in the night sky are a good illustration. There are many other examples, and Wertheimer and his colleagues in a famous series of experiments made some effort to catalogue them and reduce them to a finite number of "Laws of Perceptual Organisation" which are still quoted today.

Ghosts, belief in ghosts is one of the most common features of supernatural and mystical philosophy. At its roots it is based on the assumption that Man is essentially an individual created of two separate and distinct substances, mind and body. Most religious systems hold to this dualistic view (*see* **Dualism**). The discarnate spirit is normally assumed to progress to some other realm whereupon it loses contact with the mortal world. Occasionally, however, for one reason or another, the spirits may not progress and may become trapped and unable to escape the material world. Traditionally this is supposed to occur when the death of the individual is precipitated by some great tragedy. Serious scientific interest in ghosts has now waned rapidly.

Globalisation. In modern times the nation state has provided a structure for political, economic, and social relationships. Globalisation describes the collapse of the importance of the nation state in these relationships. The ability to communicate, travel, trade, and organise on a global scale, with ease and speed, allows political institutions, corporations, and social movements to thrive unconstrained by the boundaries of nation states.

As examples of globalisation, proponents point to global capital markets and vast free trade areas which allow multinational companies to produce and sell worldwide, the Internet and international travel which enables social movements to pursue causes on a global basis.

Gnosticism. Among the many heresies of early Christianity, especially during its first two centuries, was a group which came under the heading of Gnosticism. This was a system or set of systems which attempted to combine Christian beliefs with others derived from Oriental and Greek sources, especially those which were of a mystical and metaphysical nature, such as the doctrines of Plato and Pythagoras. There were many Gnostic sects, the most celebrated being the Alexandrian school of Valentius (fl. *c.* 136–*c.* 160). "Gnosis" was understood not as meaning "knowledge" or "understanding" as we understand these words, but "revelation." As in other mystical religions, the ultimate object was individual salvation; sacraments took the most varied forms. Many who professed themselves Christians accepted Gnostic doctrines and even orthodox Christianity contains some elements of Gnostic mysticism.

It was left to the bishops and theologians to decide at what point Gnosticism ceased to be orthodox and a difficult task this proved to be. Two of the greatest, Clement of Alexandria and his pupil Origen, unwittingly slipped into heresy when they tried to show that such men as Socrates and Plato, who were in quest of truth, were Christian in intention, and by their lives and works had prepared the way for Christ. Thus they contradicted Church doctrine which specifically said *Extra ecclesiam nulla salus*—outside the Church there is no salvation.

God and Man. The idea of gods came before the idea of God and even earlier in the evolution of religious thought there existed belief in spirits (*see* **Animism**). It was only as a result of a long period of development that the notion of a universal "God" arose, a development documented in the Old Testament. Here we are concerned with the views of philosophers.

Atheism is the positive disbelief in the existence of a God. **Agnosticism** (a term coined by T. H. Huxley, the 19th cent. biologist and contemporary of Darwin) signifies that one cannot know whether God exists or not. **Secularism** (prominent from the 1850s) pursued "a philosophy of life which ignores theology". **Deism** is the acceptance of the existence of God, not through revelation, but as a hypothesis required by reason. **Theism** also accepts the existence of God, but, unlike Deism, does not reject the evidence of revelation (*e.g.*, in the Bible or in the lives of the saints). **Pantheism** is the identification of God with all that exists (*i.e.*, with the whole universe). **Monotheism** is the belief in one God, **Polytheism** the belief in many.

Early Greek Views. Among the early Greek philosophers, Thales (*c.* 624–565 B.C.) of Miletus, in Asia Minor, Anaximander (611–547 B.C.), his pupil, and Anaximenes (b. *c.* 570 B.C.), another Miletan, were men of scientific curiosity and their speculations about the origin of the universe were untouched by religious thought.

They founded the scientific tradition of critical discussion. Heraclitus of Ephesus (*c.* 540–475 B.C.), was concerned with the problem of change. How does a thing change and yet remain itself? For him all things are flames—processes. "Everything is in flux, and nothing is at rest." Empedocles of Agrigentum in Sicily (*c.* 500–*c.* 430 B.C.) introduced the idea of opposition and affinity. All matter is composed of the so-called four elements—*earth*, *water*, *air*, and *fire*—which are in opposition or alliance with each other. All these were materialist philosophers who sought to explain the working of the universe without recourse to the gods.

Socrates, Plato, and Aristotle. Socrates (470–399 B.C.) was primarily concerned with ethical matters and conduct rather than the nature of the universe. For him goodness and virtue come from knowledge. He obeyed an "inner voice" and suffered death rather than give up his philosophy. He believed in the persistence of life after death and was essentially a monotheist. Plato (427–347 B.C.) was chiefly concerned with the nature of reality and thought in terms of absolute truths which were unchanging, logical, and mathematical. (*See* **Mind and Matter**.) Aristotle (384–322 B.C.) took his views of matter not from Democritus (atomic view) but from Empedocles (doctrine of four elements), a view which came to fit in well with orthodox medieval theology. Matter is conceived of as potentially alive and striving to attain its particular form, being moved by divine spirit or mind (*nous*). (An acorn, for example, is matter which contains the form "oak-tree" towards which it strives.) Thus there is a whole series from the simplest level of matter to the perfect living individual. But there must be a supreme source of all movement upon which the whole of Nature depends, a Being that Aristotle describes as the "Unmoved Mover", the ultimate cause of all becoming in the universe. This Being is pure intelligence, a philosopher's God, not a personal one. Unlike Plato, Aristotle did not believe in survival after death, holding that the divine, that is the immortal element in man, is mind.

Among the later Greek thinkers the Epicureans were polytheists whose gods, however, were denied supernatural powers. The Stoics built up a materialist theory of the universe, based on the Aristotelian model. To them God was an all-pervading force, related to the world as the soul is related to the body, but they conceived of it as material. They developed the mystical side of Plato's idealism and were much attracted by Babylonian astrology. They were pantheists. The Sceptics were agnostics.

From Pagan to Christian Thought. Philo, "the Jew of Alexandria," who was about 20 years older than Jesus, tried to show that the Jewish scriptures were in line with the best in Greek thought. He introduced the *Logos* as a bridge between the two systems. Philo's God is remote from the world, above and beyond all thought and being, and as His perfection does not permit direct contact with matter the divine *Logos* acts as intermediary between God and man. Plotinus (204–70), a Roman, and the founder of Neoplatonism, was the last of the great pagan philosophers. Like Philo, he believed that God had created the world indirectly through emanations—beings coming from Him but not of Him. The world needs God but God does not need the world. Creation is a fall from God, especially the human soul when enmeshed in the body and the world of the senses, yet (*see* **Determinism**) man has the ability to free himself from sense domination and turn towards God. Neoplatonism was the final stage of Greek thought drawing inspiration from the mystical side of Plato's idealism and its ethics from Stoicism.

Christianity: St. Augustine of Hippo. It was mainly through St. Augustine (354–430), Bishop of Hippo in North Africa, that certain of the doctrines of Neoplatonism found their way into Christianity. Augustine also emphasised the concept of God as all good, all wise, all knowing, transcendent, the Creator of the universe out of nothing. But, he added, since God knows everything, everything is determined by Him forever. This is the doctrine of predestination and its subsequent history is discussed under **Determinism**.

In the early centuries of Christianity, as we have seen, some found it difficult to reconcile God's perfection with His creation of the universe and introduced the concept of the *Logos* which many identified with Christ. Further, it came to be held that a power of divine origin permeated the universe, namely the Holy Spirit or Holy Ghost. A theory had to be worked out to explain the relationships of these three entities whence arose the conception of the Trinity. God is One; but He is also Three: Father, Son (the *Logos* or Christ), and Holy Ghost.

This doctrine was argued by the Apologists and the Modalists. The former maintained that the *Logos* and the Holy Spirit were emanations from God and that Jesus was the *Logos* in the form of a man. The Modalists held that all three Persons of the Trinity were God in three forms or modes: the *Logos* is God creating, the Holy Spirit God reasoning, and God is God being. This led to a long discussion as to whether the *Logos* was an emanation from God or God in another form; was the *Logos* of like *nature* with God or of the same *substance*?

This was resolved at the Council of Nicaea (325) when Athanasius formulated the orthodox doctrine against Arius (*q.v.*): that the one God is a Trinity of the same substance, three Persons of the same nature—Father, Son, and Holy Ghost.

St. Thomas Aquinas (1227–74), influenced greatly by Aristotle's doctrines, set the pattern for all subsequent Catholic belief even to the present time. He produced rational arguments for God's existence: *e.g.*, Aristotle's argument that, since movement exists, there must be a prime mover, the Unmoved Mover or God; further, we can see that things in the universe are related in a scale from the less to the more complex, from the less to the more perfect, and this leads us to suppose that at the peak there must be a Being with absolute perfection. God is the first and final cause of the universe, absolutely perfect, the Creator of everything out of nothing. He reveals Himself in his Creation and rules the universe through His perfect will. How Aquinas dealt with the problem of predestination is told under **Determinism**.

Break with Medieval Thought. Renaissance thinkers, free to think for themselves, doubted the validity of the arguments of the Schoolmen but most were unwilling to give up the idea of God (nor would it have been safe to do so). Mystics (*see* **Mysticism**) or near-mystics such as Nicholas of Cusa (*c.* 1401–64) and Jacob Boehme (1575–1624) taught that God was not to be found by reason but was a fact of the immediate intuition of the mystical experience.

Giordano Bruno held that God was immanent in the infinite universe. He is the unity of all opposites, a unity without opposites, which the human mind cannot grasp. Bruno was burned at the stake in 1600 at the instigation of the Inquisition (a body which, so we are told, never caused pain to anyone since it was the civil power, not the Inquisition, that carried out the unpleasant sentences) for his heresy.

Francis Bacon, who died in 1626, separated, as was the tendency of that time, science from religion. The latter he divided into the two categories of natural and revealed theology. The former, through the study of nature, may give convincing proof of the existence of a God but nothing more. Of revealed theology he said: "we must quit the small vessel of human reason . . . as we are obliged to obey the divine law, though our will murmurs against it, so we are obliged to believe in the word of God, though our reason is shocked at it."

Hobbes was a complete materialist and one feels that his obeisance to the notion was politic rather than from conviction. However, he does mention God as starting the universe in motion; infers that God is corporeal but denies that His nature can be known.

From Descartes Onwards. Descartes (1596-1650) separated mind and body as different entities but believed that the existence of God could be deduced by the fact that the idea of him existed in the mind. Whatever God puts into man, including his ideas, must be real. God is self-caused, omniscient, omnipotent, eternal, all goodness and truth. But Descartes neglected to explain how mind separate from body can influence body, or God separate from the world can influence matter.

Spinoza (1632–77) declared that all existence is embraced in one substance—God, the all-in-all. He was a pantheist and as such was rejected by his Jewish brethren. But Spinoza's God has neither personality nor consciousness, intelligence nor purpose, although all things follow in strict law from His nature. All the thoughts of everyone in the world, make up God's thoughts.

Bishop Berkeley (1685–1753) took the view that things exist only when they are perceived, and this naturally implies that a tree, for example, ceases to exist when nobody is looking at it. This problem was solved to his own satisfaction by assuming that God, seeing everything, prevented objects from disappearing when we were not present. The world is a creation of God but it is a spiritual or mental world, not a material one.

Hume (1711–76), who was a sceptic, held that human reason cannot demonstrate the existence of God and all past arguments to show that it could were fallacious. Yet we must believe in God since the basis of all hope, morality, and society is based upon the belief. Kant (1724–1804) held a theory similar to that of Hume. We cannot know by reason that God exists, nor can we prove on the basis of argument anything about God. But we can form an idea of the whole of the universe, the one Absolute Whole, and personify it. We need the idea of God on which to base our moral life, although this idea of God is transcendent, *i.e.*, goes beyond experience.

William James (1842–1910), the American philosopher (*see* **Pragmatism**), held much the same view: God cannot be proved to exist, but we have a will to believe which must be satisfied, and the idea works in practice. Hegel (1770-1831) thought of God as a developing process, beginning with "the Absolute" or First Cause and finding its highest expression in man's mind, or reason. It is in man that God most clearly becomes aware of Himself. Comte (1798-1857), the positivist, held that religion belongs to a more primitive state of society.

Many modern liberal theologians, influenced by the developments in science, psychology, and post-modern philosophy, have sought to develop a non-theistic understanding of God. Non-theists reject the notion of God as a being with an identity and a will. Rather than endorse atheism or agnosticism however, non-theists understand God as the shared basis of humanity, or ground of human being. Critics suggest that such non-theism is in fact humanism.

Good and Evil.

Early Philosophers' Views. The early Greek philosophers were chiefly concerned with the laws of the universe, consequently it was common belief that knowledge of these laws, and living according to them, constituted the supreme good. Heraclitus, for example, who taught that all things carried with them their opposites, held that good and evil were like two notes in a harmony, necessary to each other. "It is the opposite which is good for us". Democritus, like Epicurus (*q.v.*), held that the main goal of life is happiness, but happiness in moderation. The good man is not merely the one who *does* good but who always *wants* to do so: "You can tell the good man not by his deeds alone but by his desires." Such goodness brings happiness, the ultimate goal. On the other hand, many of the wandering Sophist teachers taught that good was merely social convention, that there are no absolute principles of right and wrong, that each man should live according to his desires and make his own moral code. To Socrates knowledge was the highest good because doing wrong is the result of ignorance: "no man is voluntarily bad."

Plato and Aristotle, although differing in many other respects, drew attention to the fact that man is composed of three parts: his desires and appetites, his will, and his reason. A man whose reason rules his will and appetites is not only a good but a happy man; for happiness is not an aim in itself but a by-product of the good life. Aristotle, however, emphasised the goal of self-realisation, and thought that if the goal of life is (as Plato had said) a rational attitude towards the feelings and desires, it needs to be further defined. Aristotle defined it as the "Golden Mean"—the good man is one who does not go to extremes but balances one extreme against another. Thus courage is a mean between cowardice and foolhardiness. The later philosophers Philo and Plotinus held that evil was in the very nature of the body and its senses. Goodness could only be achieved by giving up the life of the senses and, freed from the domination of the body, turning to God, the source of goodness.

Christian Views. St. Augustine taught that everything in the universe is good. Even those things which appear evil are good in that they fit with the harmony of the universe like shadows in a painting. Man should turn his back on the pleasures of the world and turn to the love of God. Peter Abelard (1079–1142) made the more sophisticated distinction when he suggested that the wrongness of an act lies not in the act itself, but in the intention of the doer: "God considers not what is done but in what spirit it is done; and the merit or praise of the agent lies not in the deed but in the intention." If we do what we believe to be right, we may err, but we do not sin. The only sinful man is he who deliberately sets out to do what he knows to be wrong. St. Thomas Aquinas agreed with Aristotle in that he believed the highest good to be realisation of self as God has ordained, and he also agreed with Abelard that intention is important. Even a good act is not good unless the doer intended it to have good consequences. Intention will not make a bad act good, but it is the only thing that will make a good act genuinely good.

In general, Christianity has had difficulties in solving the problem of the existence of evil; for even when one accepts that the evil men do is somehow tied up with the body, it is still difficult to answer the question: how could an all-good God create evil? This is answered in one of two ways: (*a*) that Adam was given free-will and chose to sin (an answer which still does not explain how sin could exist anywhere in the universe of a God who created everything); (*b*) by denying the reality of evil as some Christians have chosen to do (*e.g.*, Christian Science *q.v.*). The Eastern religions, (*see* **Zoroastrianism**), solved the problem in a more realistic way by a dualism which denied that their gods were the creators of the whole universe and allowed the existence of at least two gods, one good and one evil. In Christianity there is, of course, a Devil, but it is not explained whence his evil nature came.

Later Philosophic Views. Hobbes equated good with pleasure and evil with pain. They are relative to the individual man in the sense that "one man's meat is another man's poison." Descartes believed that the power to distinguish between good and evil given by God to man is not complete, so that man does evil through ignorance. We act with insufficient knowledge and on inadequate evidence. Locke, believing that at birth the mind is a blank slate, held that men get their opinions of right and wrong from their parents. By and large, happiness is good and pain is evil. But men do not always agree over what is pleasurable and what not. Hence laws exist and these fall into three categories: (1) the divine law; (2) civil laws; (3) matters of opinion or reputation which are enforced by the fact that men do not like to incur the disapproval of their friends. We learn by experience that evil brings pain and good acts bring pleasure and, basically, one is good because not to be so would bring discomfort.

Kant (*see* **God and Man**) found moral beliefs to be inherent in man whether or not they can be proved by reason. There is a categorical imperative which makes us realise the validity of two universal laws: (1) "always act in such a way that the maxim determining your conduct might well become a universal law; act so that you can will that everybody shall follow the principle of your action; (2) "always act so as to treat humanity, whether in thine own person or in that of another, in every case as an end and never as a means."

Schopenhauer (1788–1860) was influenced by Buddhism and saw the will as a blind impelling striving, and desire as the cause of all suffering. The remedy is to regard sympathy and pity as the basis of all morality and to deny one's individual will. This is made easier if we realise that everyone is part of the Universal Will and therefore the one against whom we are struggling is part of the same whole as ourselves.

John Stuart Mill and Jeremy Bentham were both representatives of the Utilitarian school, believing that good is the greatest good (happiness) of the greatest number (*see* **Utilitarianism**).

Nietzche. Understanding of good and evil has been challenged radically by the work of Nietzsche. He rejected morality altogether, and argued that it was a sophisticated means of control and oppression. For Nietzsche, morality was a mask for power, and the role of the philosopher was to tear off the mask, and not to justify and enforce the oppression and exploitation allowed by traditional understandings of good and evil. Nietzsche's ideas influenced Foucault, Heidegger, and Sartre, who each challenged the authenticity of moral vocabulary and rules.

Richard Rorty and Michael Walzer, two well-known moral relativists, challenged the nature of good and evil, and argued that there are no objective grounds from which we can justify morality. Relativists want to retain the vocabulary of good and evil, unlike Nietzsche, but argue that good and evil are informed by the particular values and practices of cultures, and can only be judged from within (relative to) those practices.

Whilst these notions of good and evil have sustained serious challenges, many are encouraged by the increased recognition of international human rights, which are based on a commitment to the universality of the value of human life as good, and a violation of those rights as a recognised and punishable evil.

Lastly, there is the view held mostly by political thinkers that good is what is good for society in general (*see* **State and Man**).

Guild Socialism, a British form of syndicalism (*q.v.*) created in 1906 by an architect, A. J. Penty, who was soon joined by A. R. Orage, S. G. Hobson, and G. D. H. Cole. The guild socialists advocated a restoration of the mediaeval guild system as was being recommended by the French syndicalists whose programme involved a return to direct economic action, a functional industrial structure, return of craftsmanship, and distrust of the state. Guild socialists believed that value was created by society as a whole rather than by individuals singly, and that capitalist economists had recommended the acquisition of wealth without emphasising the social responsibilities which wealth should bring. The trade unions were to be organised to take over and run their own industries after nationalisation.

Thus guild socialists were not only against capitalism but also against state socialism in which the state took over the control of industry. Political authority was held to be uncongenial to human freedom and therefore nothing was to be gained by the substitution of state bureaucracy for capitalist control.

The National Guilds League, formed in 1915, advocated abolition of the wages system, self-government in industry and control by a system of national guilds acting in conjunction with other functional democratic organisations in the community. This body was dissolved in 1925.

H

Hajj, the pilgrimage to Mecca required of all Muslims, the fifth pillar of Islamic practice. A series of profound rituals are undertaken in Mecca.

Hanukkah (**Chanukah**). The Jewish festival of light, held in December. It means dedication and commemorates the Jewish struggle for religious freedom.

Hasidism (**Chasidism**). From the Hebrew *hasid*, pious or faithful one. A Jewish mystical movement which began in Poland in the 18th century, and which spread widely, first through Eastern Europe and then into Western Europe and America. The movement was founded by Israel ben Eliezer (1700–60), who came to be known as the Ba'al Shem Tov ("Master of the Good Name"). It was originally opposed to the authority of the rabbis and traditional Jewish practices. According to Hasidism, true religion comes not from study of the sacred texts but from purity of heart, prayer and observance of the commandments. The movement was also characterized by ecstatic forms of worship. Its present day followers are ultra-conservative orthodox Jews.

Hedonism. From Greek *hedone*, pleasure. The theory of ethics in which pleasure is regarded as the chief good, or proper end, of action. This is sometimes called ethical hedonism and is then distinguished from psychological hedonism, which is the theory that behaviour is primarily motivated by the pursuit of pleasure and the avoidance of pain. Psychological hedonism can of course be employed to support ethical hedonism.

This view, that only pleasure is ultimately good, has been held by many distinguished philosophers, including Epicurus, Locke, Hobbes, Hume, Bentham and Mill. In the case of the last two, it is closely associated with utilitarianism (*q.v.*). Although the term "pleasure" suggests physical enjoyments, hedonists have taken it to include intellectual pleasures also. They also argue that many things beside pleasure, such as virtue and knowledge, are desirable in that they produce pleasure.

Hermeneutics. Originally, the study of the general principles of biblical interpretation. The term came into philosophy in the late 19th century to refer to a more general study of interpretation, namely the interpretation of the significance of human actions, utterances, products *etc*.

Hermeticism (or **Hermetism**). Philosophies based on the Hermetic writings, also called the Hermetica, works on occult, theological and philosophical subjects ascribed to the Egyptian God Thoth (referred to in Greek as Hermes Trismegistos, Hermes the thrice-greatest). This collection, written in Latin and Greek, dates from 2nd–3rd centuries A.D. It reached Europe, from the Arabs, in the late 15th century, and had some influence during the Renaissance. It continues to fascinate modern devotees of magic and astrology.

The term also has a literary sense. It refers to an Italian poetic movement of the 20th century, characterized by brevity and obscurity.

Hinduism, the religion and social institutions of the great majority of the people of India. Hinduism has no fixed scriptural canon but its doctrines are to be found in certain ancient works, notably the *Veda*, the *Brahmanas*, the *Upanishads*, and the *Bhagavad-gita*.

The dark-skinned Dravidians invaded India between *c.* 3250 and 2750 B.C. and established a civilisation in the Indus valley. They were polytheists who worshipped a number of naturegods; some elements of their beliefs persisted into Hinduism. They were subdued by light-skinned Indo-European speakers who invaded from Asia Minor and Iran about 1500 B.C. The language of these people was Vedic, parent of Sanskit in which their religious literature (the Vedas) came to be written after many centuries of oral transmission.

The *Veda* or Sacred Lore has come down to us in the form of mantras or hymns of which there are four great collections, the best-known being the *Rig-Veda*. These Vedic Aryans worshipped nature-deities, their favourites being Indra (rain), Agni (fire), and Surya (the sun). Their religion contained no idolatry but became influenced by the beliefs of the Dravidians. Sacrifice and ritual became predominant in a ceremonial religion.

As a reaction a more philosophic form arose (*c.* 500 B.C.) with its scriptures in the *Upanishads*. At its highest level known as Brahmanism belief is in a subtle and sophisticated form of monotheism (Brahman is an impersonal, all-embracing spirit), but there is a tolerant acceptance of more primitive beliefs. Thus Vishnu (a conservative principle) and Siva (a destructive principle) grew out of Vedic conceptions. The two great doctrines of Hinduism are *karma* and transmigration. The universal desire to be reunited with the absolute (*atman* or Brahman) can be satisfied by following the path of knowledge. Life is a cycle of lives (*samsara*) in which man's destiny is determined by his deeds (*karma*) from which he may seek release (*moksa*) through ascetic practices or the discipline of Yoga (*q.v.*). Failure to achieve release means reincarnation—migration to a higher or lower form of life after death—until the ultimate goal of absorption in the absolute is reached.

In the great Sanskrit epic poems *Ramayana* and *Mahabharata* the deity takes three forms, represented by the divine personalities of Brahma, Vishnu, and Siva. There are also lower gods, demi-gods, supernatural beings, and members of the trinity may even become incarnate, as Vishnu became identified with Krishna, one of the heroes of the *Mahabharata* and the well-known *Bhagavad-gita*.

The Caste System. The ritual and legalistic side of Brahmanism is the caste system based on the elaborate codes of the *Law of Manu*, according to which God created distinct orders of men as He created distinct species of animals and plants. Men are born to be Brahmans, soldiers, agriculturists, or servants, but since a Brahman may marry a woman from any of these castes, an endless number of sub-castes arise. Caste discrimination was outlawed in 1950.

Hinduism has historically shown great tolerance for varieties of belief and practice. Ideas pleasant and unpleasant have been assimilated: fetichism, demon-cults, animal-worship, sexual cults (such as the rites of *Kali* in Kolkata). Today, as would be expected in a country which is in the throes of vast social change, Hinduism itself is changing. Under the impact of modern conditions new ideas are destroying old beliefs and customs. A militant political Hinduism, fanned by the Bharatiya Janata Group (BJP) extols Hindu fundamentalism. There are nearly one billion Hindus worldwide (816,000 in England and Wales at the 2011 Census). Hinduism is now the world's third largest religion. The Hindu temple in Dudley (opened in 2006) is the largest place of Hindu worship in Europe. *See also* **Jainism** and **Sikhism**.

Homoeopathy, an alternative branch of medicine whose motto *Similia Similibus Curantur* (like cures like) sums up its particular approach to therapy. In essence the homoeopathists claim that a disease can be treated by administering quite minute doses of a substance which produce symptoms (in the healthy person) similar to those induced by the disease itself. The founder and populariser of this novel approach to medicine was the German Samuel Hahnemann who was born in 1775, a friend of the physician Mesmer who propagated hypnotherapy. Hahnemann lived to see his ideas spread across the civilised world (despite the grave theoretical difficulties implicit in the question of how the very minute dosages actually achieve any result at all).

The amount of research being carried out in homoeopathy by doctors *etc.*, is phenomenal; furthermore, two real milestones occurred in the UK when papers on homoeopathy were published in *The Lancet* in 1988 and in the *British Medical Journal* in 1989. Scientists in contrast remain convinced sceptics. Indeed, various trials have found no evidence that homoeopathy works any better than a placebo. It is possible the Government will blacklist it on the NHS.

Homosexuality. *See* **Gay Movement**.

Human Rights. *See* **Universal Declaration of Human Rights, J52.**

Humanism, the term applied to (1) a system of education based on the Greek and Latin classics; and (2) the vigorous attitudes that accompanied the end of the Middle Ages and were represented at different periods by the Renaissance, the Reformation, the Industrial Revolution, and the struggle for democracy. These include: release from ecclesiastical authority, the liberation of the intellect, faith in progress, the belief that man himself can improve his own conditions without supernatural help and, indeed has a duty to do so. "Man is the measure of all things" is the keynote of humanism. The humanist has faith in man's intellectual and spiritual resources not only to bring knowledge and understanding of the world but to solve the moral problems of how to use that knowledge.

That man should show respect to man irrespective of class, race or creed is fundamental to the humanist attitude to life. Among the fundamental moral principles he would count freedom, justice and tolerance.

Around 4,200 humanist weddings take place annually in Scotland (where since 2005 they have been legal without an additional civil ceremony).

Hussites, the followers of John Hus, the most famous pupil of John Wyclif. He was the rector of Prague University and, although it is now by no means certain that his beliefs were heretical, he was condemned to death for heresy and burnt at the stake in 1415 at Constance whither he had come with a safe conduct issued by the Emperor Sigismund of Hungary. The latter based his action on the doctrine that no faith need be kept with heretics, but it is obvious that the main objection to Hus was his contempt for authority of any kind. After their leader's death, the Hussites became a formidable body in Bohemia and Moravia. They took up arms on behalf of their faith, their religion being strongly imbued with political feeling (hostility to Germanism and to the supremacy of the Roman Catholic Church). Their religious struggles for reform led to the Hussite Wars during which the movement splintered into several groups.

Hutterites. *See* **Mennonites**.

Hypnosedation. *See* **Mesmerism.**

Hypnotism. *See* **Mesmerism**.

I

I Ching, the Chinese "Book of Changes" which is supposed to provide a practical demonstration of the truths of ancient Chinese philosophy. The method consists of casting forty-nine sticks into two random heaps, or more simply, of tossing three coins to see if there is a preponderance of heads or tails. The coins are cast six times whereupon the head-tail sequence achieved is referred to a coded series of phrases in the book, which are supposed to relate in some way to the question held in the mind when the sticks or coins are being cast. The phrases are without exception vague, and platitudes such as "Evil people do not further the perseverance of the superior man," *etc.*, abound.

Consequently it is not difficult to read into such amorphous stuff a suitable "interpretation" or answer to one's unspoken question. The I Ching was once a great fad in Europe and America.

Iconoclasm. *See* **Icons, L57**.

Idealism, in philosophy, the belief that there is no matter in the universe, that all that exists is mind or spirit. *See* **Mind and Matter** and **Realism.**

Illuminati, a secret society founded in 1776 by Adam Weishaupt, a Bavarian professor of canon law at Ingolstadt, in an attempt to combat superstition and ignorance by founding an association for rational enlightenment and the regeneration of the world. Under conditions of secrecy it sought to penetrate and control the masonic lodges for subversive purposes. Among its members were Goethe and Schiller. The Order spread to Austria, Italy and Hungary but was condemned by the Catholic Church and dissolved in 1785 by the Bavarian government.

Immortality. The belief in a life after death has been widely held since the earliest times. It has certainly not been universal, nor has it always taken a form which everyone would find satisfying. In the early stages of human history or prehistory everything contained a spirit (*see* **Animism**) and it is obvious from the objects left in early graves that the dead were expected to exist in some form after death.

The experience of dreams, too, seemed to suggest to the unsophisticated that there was a part of man which could leave his body and wander elsewhere during sleep.

It will be helpful to classify the various types of belief which have existed in philosophical thought regarding this problem: (1) There is the idea that, although *something* survives bodily death, it is not necessarily eternal. Thus most primitive peoples were prepared to believe that man's spirit haunted the place around his grave and that food and drink should be set out for it, but that this spirit did not go on forever and gradually faded away. (2) The ancient Greeks and Hebrews believed for the most part that the souls of the dead went to a place of shades there to pine for the world of men. Their whining ghosts spent eternity in a dark, uninviting region in misery and remorse. (3) Other people, and there were many more of these, believed in the transmigration of souls with the former life of the individual determining whether his next life would be at a higher or lower level. Sometimes this process seems to have been thought of as simply going on and on, by others (*e.g.*, in Hinduism and Buddhism) as terminating in either non-sentience or union with God but in any case in annihilation of the self as self.

Believers in this theory were the Greek philosophers Pythagoras, Empedocles, Plato (who believed that soul comes from God and strives to return to God, according to his own rather confused notions of the deity. If it fails to free itself completely from the body it will sink lower and lower from one body to another.) Plotinus held similar views to Plato, and many other religious sects in addition to those mentioned have believed in transmigration. (4) The belief of Plato and Aristotle that if souls continue to exist after death there is no reason why they should not have existed before birth (this in part is covered by (3)), but some have pointed out that eternity does not mean "from now on," but the whole of the time before and after "now"—nobody, however, so far as one knows, held that *individual* souls so exist. (5) The theory that the soul does not exist at all and therefore immortality is meaningless: this was held by Anaximenes in early Greek times; by Leucippus, Democritus, and the other Greek atomists; by the Epicureans from the Greek Epicurus to the Roman Lucretius; by the British Hobbes and Hume; by Comte of France; and William James and John Dewey of America. (6) The thesis, held notably by Locke and Kant, that although we cannot prove the reality of soul and immortality by pure reason, belief in them should be held for moral ends. (For the Christian view *see* **God and Man, Determinism and Free-will.**)

Imperialism, the practice by a country, which has become a nation and embarked upon commercial and industrial expansion, of acquiring and administering territories, inhabited by peoples usually at a lower stage of development, as colonies or dependencies. Thus the "typical" imperialist powers of the mid-19th cent. and earlier were Britain, France, Belgium, Holland, Spain and Portugal, whilst Germany, Italy, and Japan, which either did not have unity during this period or adequate industrial expansion, tried to make good their weakness in this direction by war in the late 19th cent.

Individualism. The doctrine that the single person is the basic unit of political analysis. The term covers all political and social philosophies that place a high value on the freedom of the individual. It is believed that the interests of the individual are best served by allowing him maximum freedom and responsibility. Society is seen as a collection of individuals. So individualism opposes controls over the individual, especially when they are exercised by the state. The most extreme form is anarchism, but all individualists believe that government interference should be kept to a minimum. It is opposed to collectivism (*q.v.*). The term was originally used critically, to refer to egoism as a matter of principle.

Intelligent Design (ID). *See* **Creationism.**

Islam, the religion of which Mohammed (570–632) was the prophet, the word signifying submission to the will of God. It is one of the most widespread of religions. Its adherents are called Muslims. Islam came later than the other great monotheistic religions (Judaism and Christianity) and drew its inspiration mainly from Judaism and Nestorianism. Mohammed accepted the inspiration of the Old Testament and claimed to be a successor to Moses, but recognised Jesus only as a prophet.

The Koran (Quran) is the sacred book of Islam. Its revelations are contained in the 114 *suras* or chapters: all but one begin with the words: "In the name of Allah, the Merciful, the Compassionate." It is written in classical Arabic, and Muslims memorise much or all of it. Its ethical teachings are high. Like orthodox Judaism Islam is a literal-minded religion lived in everyday life. No Muslim is in any doubt as to exactly how he should carry on in the events of his day.

The devout Muslim has five duties: (1) Once in his life he must say with absolute conviction: "There is no God but Allah, and Mohammed is His Prophet". (2) Prayer preceded by ablution must be five times daily—on rising, at noon, in mid-afternoon, after sunset, and before retiring. The face of the worshipper is turned in the direction of Mecca. (3) The giving of alms generously, including provisions for the poor. (4) The keeping of the fast of Ramadan, the holy month, during which believers in good health may neither eat nor drink nor indulge in wordly pleasures between sunrise and sunset. (5) Once in his life a Muslim, if he can, must make the pilgrimage to Mecca. (*see* **Hajj**)

In addition, drinking, gambling, and the eating of pork are forbidden and circumcision is practised. Polygamy is permitted, although decreasing; sexual relations outside marriage are disapproved of; marriage is only with the wife's consent; and divorce may be initiated by either husband or wife. A great advantage in the spread of Islam has been its lack of race prejudice.

Mohammed's main achievements were the destruction of idolatry, the welding of warring tribes into one community, the progress of a conquest which led after his death to the great and cultured empire which spread throughout the Middle East into north Africa, north India, and ultimately to Spain. That it did not spread all over Europe was due to the Muslim defeat by Charles Martel at Poitiers in 732.

The holiest cities of Islam are Mecca, Medina, Jerusalem and Kairouan.

During the 1980s, militant Islam became a major political force in Iran (under Ayatollah Khomeini). Islamic fundamentalism became, in the 1990s, a growing political force in, for example, Algeria, Egypt, Yemen, Afghanistan, Pakistan and much of central Asia.

The most extreme form of fundamentalism to be implemented then was the Taleban regime in Afghanistan until its overthrow. Currently, parts of Iraq Syria and Libya are also witnessing extremist jihadist rule, whilst Boko Haram in northern Nigeria is also brutal.

The number of Muslims in England and Wales was 2,706,066 at the 2011 Census. One-third of these was under 15. This total could rise to over 7 million by 2050. There are over 1,600 mosques and prayer rooms. Nearly half are controlled by the Deobandi sect. The first was established at Woking in Surrey in 1890. The largest mosque in Britain (the Baitul Futuh mosque in Morden) was completed in 2003. The largest mosque in the western world is in Dearborn, Michigan, USA. Globally, there are today an estimated 1,875,000,000 Muslims. (expected to rise to 2·8 billion by 2050).

The Masjid al-Haram mosque in Mecca is the world's largest mosque.

J

Jainism. The Jains are an Indian sect, largely in commerce and finance. Their movement founded by Vardhamana, called Mahavira (the great hero), in the 6th cent. B.C. arose rather earlier than Buddhism in revolt against the ritualism and impersonality of **Hinduism** (*q.v.*). It rejects the authority of the early Hindu Vedas and does away with many of the Hindu deities whose place is largely taken by Jainism's twenty-four immortal saints; it despises caste distinctions and modifies the two great Hindu doctrines of *karma* and transmigration. Jain philosophy is based on *ahimsa*, the sacredness of all life, regarding even plants as the brethren of mankind, and refusing to kill even the smallest insect. The first Jain temple in the Western world opened in 1988 in Leicester.

Of an estimated 5,300,000 Jains world-wide, 98% of these are in India. Jainism claims over 30,000 devotees in Britain. The largest number outside India live in Kenya.

Jansenism, the name given by the Roman Catholic Church to the heresy of Cornelius Jansen (1585-1638), a Dutch-born professor of theology at Louvain, derived from his work *Augustinus*, published after his death. He proposed that without special grace from God, the performance of his commandments is impossible, that man has no free will, and that most human beings are condemned to damnation. The movement was very influential in France in the 17th century.

Jehovah's Witnesses. One of the best known offshoots of mainstream Christianity, Jehovah's Witnesses are renowned for their doorstep witness. Founded in the second half of the nineteenth century in Pittsburgh by Charles Taze Russel, and taking their name from a passage in Isaiah 43, they are strongly millenialist, and put much emphasis on the return of Christ and his heavenly rule upon earth. Various attempts to set a specific date since 1874 have proved unsuccessful, however. Russel, rejecting the notion of a Hell, put a focus on the nothingness of death until the Second Coming or Rapture. At this point the 144, 000 or 'little flock' will rule with Christ in Heaven, whilst other Jehovah's Witnesses, the 'great crowd' will be ruled on Earth.

They support their beliefs based on the Bible, in particular their own version, The New World Translation. They emphasise the Judaic name for God, Jehovah and regard him as God alone. They reject the Trinity, and regard Jesus Christ as God's first creation and therefore inferior, and the Holy Spirit as another way of expressing God's power in action. They believe in upholding what they regard as the universal elements of the Mosaic Law, and are well known for their rejection of blood transfusions as non-biblical.

They regard other religions and denominations as false, rejecting in particular strongly hierarchical church organisation, despite criticisms of authoritarianism themselves. At the heart of the movement lies directed Bible study supported by its huge publishing wing, the Watch Tower Bible and Tract Society. There are *c.* 8 million members.

Jesuits. *See* **E7**.

Jesus People, one of the early revivals of interest in the teaching and personality of Jesus Christ which featured from the 1960s as part of the American "Hippy" scene. The Jesus People were generally white but not necessarily of an orthodox Christian background. The cult developed in California.

Jihad, the Islamic term is best translated 'to struggle to the utmost'. In the West it has become synonymous with a holy war.

Judaism, the relgion of the Jews, the oldest of the great monotheist religions, parent of Christianity and Islam, the development of which is presented in the Old Testament. The creed of Judaism is based on the concept of a transcendent and omnipotent One True God, the revelation of His will in the *Torah*, and the special relation between God and His "Chosen People." The idea of Incarnation is rejected, Jesus is not recognised as the Messiah. The *Torah* is the Hebrew name for the Law of Moses (the Pentateuch) which, Judaism holds, was revealed to Moses on Mount Sinai soon after the exodus of the Israelites from Egypt (1230 B.C.).

Most critics today deny the Mosaic authorship of the first five books of the Bible and believe them to be a compilation from four main sources known as J(Jahvist), E (Elohist), D (Deuteronomist) and P (Priestly Code), distinguished from each other by the name used for God, language, style, and internal evidence. From the historical point of view an important influence on Judaism may have been the monotheism of Akhenaten, the "heretic" Pharaoh (note, for example, the striking resemblance between Psalm 104 and Akhenaten's "Hymn to the Sun"). But some scholars now question how monotheistic early Judaism actually was.

Talmud. The Talmud is a book containing the civil and canonical laws of the Jews and includes the *Mishna*, a compilation from oral tradition written in Hebrew, and the *Gemara*, a collection of comments and criticisms by Jewish rabbis, written in Aramaic. There are in fact two Talmuds: the one made in Palestine (the Jerusalem Talmud), finished at the beginning of the 5th cent B.C., and the other made in Babylon, completed at the end of the 6th cent B.C.

Judaism at the beginning of the Christian era had a number of sects: (1) the Pharisees (whose views include the first clear statement of the resurrection of the just to eternal life and the future punishment of the wicked) who held to the *Torah* and the universality of God; (2) the Sadducees, the upper class of priests and wealthy landowners, to whom God was essentially a national God and who placed the interests of the state before the *Torah*; they rejected ideas of resurrection and eternal life; (3) the Essenes (*q.v.*) who were regarded as a puritanical break-away movement by both parties. The views of the Pharisees prevailed.

Jewish Philosophers. Jewish writing continued through the years and some books were added to the *Torah*, among them the Three Major Prophets and certain books of the Twelve Minor Prophets. There were also the Apocalyptic writers who were unorthodox in their preaching of a divinely planned catastrophic end to the world with a "new Heaven and a new earth," preceded by a divine Messiah, and a future life—all of which beliefs influenced early Christianity. Judah Halevi of Toledo (*c.* 1085–*c.* 1140) and Moses Maimonides of Cordova (1135–1204) were the great Jewish philosophers.

Modern Movements in Judaism stem from the Enlightenment, notably with Moses Mendelssohn in the 18th cent. who accepted, as was the tendency of the period, only that which could be proved by reason. He translated the Pentateuch into German thus encouraging German Jews to give up Yiddish and Hebrew for the language of the land and thereby preparing them for their vast contribution to Western civilisation. One of his disciples, David Friedländer (d. 1834) instituted "reform" Judaism.

He wanted to remove anything that would hamper the relationships of Jews with their neighbours or tend to call in doubt their loyalty to their adopted state. A similar movement in America (1885) called for the rejection of dietary laws, the inauguration of Sunday services, and the repudiation of Jewish nationalism.

Between "reform" and orthodoxy there arose the conservative movement which, in England, includes prayers in English in the service, does not segregate men and woman in the synagogue, and translates the Law in a more liberal way. Judaism is essentially a social and family religion which, more than almost any other concerns itself with the observances of every aspect of daily life. As in Islam (*q.v.*) details are laid down in the most minute way for the behaviour of the orthodox.

The home is the main Jewish institution. Circumcision takes place eight days after birth, and a boy becomes a man for religious purposes at his Bar Mitzvah at the age of thirteen.

There are currently divisions in Judaism over the role women can play in Jewish religious life. The Ultra-Orthodox Jews are known as the *haredim*. Only Orthodox Judaism now rejects same sex marriage.

Among festivals are Passover, recalling the Exodus; Rosh Hashanah (the Jewish New Year), the anniversary of the Creation and the beginning of ten days of penitence ending with Yom Kippur (the Day of Atonement), a day of fasting spent in the synagogue; Purim, celebrating the deliverance of the Jews from Haman; and Hanukkah (*q.v.*), celebrating their victory against the Syrians under their leader Judas Maccabeus. A new and semi-religious festival is the Yom Haatzmaut, the anniversary of the birth of the state of Israel.

Countries with the largest Jewish populations are the USA (5,300,000), Israel (5,250,000) and France (521,000). France has Europe's largest Jewish population. At the 2011 Census there were 263,346 Jews in England and Wales. Islam, Hinduism and Sikhism have all overtaken Judaism in numbers in the UK. The Chief Rabbi is Ephraim Mirvis. There are over 16 million Jews world-wide, close to the pre-war figure of 16·5 million.

K

Kabbala. *See* **Cabala.**

Khalsa, the sacred brotherhood of the Sikhs (*q.v.*).

Koran (Quran). *See* **Islam.**

Ku Klux Klan. After the American Civil War (1861–65) southern conservatives and ex-Confederate leaders began to fear both Black and poor White rule. Taxes were rising owing to radical legislation and the tax-burdened and disenfranchised planters finally took to illegal means to achieve their ends by trying to effect an alliance with the poor White and small farmer through appealing to his anti-Black prejudice.

Hence the Ku Klux Klan was formed in 1866 as a secret society by a small group of Confederate veterans in Tennessee with the intention of frightening Blacks by dressing in ghostly white robes in the guise of the spirits of dead soldiers. But the movement spread like wild-fire throughout the South encouraged by small farmers and planters alike. General Nathan Bedford Forrest was appointed "Grand Wizard" of the Klan "empire" and in every community armed Klansmen riding at night horsewhipped "uppity" Blacks, beat Union soldiers, and threatened carpet-bag politicians (*i.e.*, fortunehunters from the North). Soon several similar organisations arose, many of which did not stop at torture or murder.

The Klan was a vicious and contemptible organisation in which former Southern leaders trying to regain control deliberately set poor and middle-class Whites against the Blacks by appeal to race prejudice. Congress struck back with laws and intervention of Federal troops, and after a large number of convictions in South Carolina much of the violence stopped.

After the 1914–18 war the movement, dormant since 1900, revived as a sadistic anti-Black, anti-Jewish, anti-Catholic society, spreading to the north as well as the south. By 1926, the Klan began to subside once more. While it revived again in the mid-1960s, it soon fell back. It number only a few thousand extremists today in 190 branches, but there are many other racist, white power movements.

L

Lamaism, the religion of Tibet. Its beliefs and worship derive from the Mahayana form of Buddhism which was introduced into Tibet in 749. The emphasis laid by its founder on the necessity for self-discipline and conversion through meditation and the study of philosophy deteriorated into formal monasticism and ritualism.

The Dalai Lama, as the reincarnated Buddha, was both king and high priest, a sort of pope and emperor rolled into one. Under him was a hierarchy of officials in which the lowest order was that of the monks who became as numerous as one man in every six or seven of the population. The main work carried out by this vast church-state was the collection of taxes to maintain the monasteries and other religious offices. Second in power to the Dalai Lama was the Panchen or Tashi Lama believed to be a reincarnation of Amitabha, another Buddha.

The Dalai Lama fled to India back in 1959 when the Chinese entered his country. For a brief period following his departure, the Panchen Lama surprised the Western world by publicly welcoming the Communist invasion, but he later renounced the regime. The current Panchen Lama's whereabouts are not known.

Latter-day Saints. *See under* **Mormons**.

Levellers, an English military-politico-religious party prominent in the Parliamentary Army about 1647 which stood for the rights of the people. *See* **Diggers**.

Liberalism is the view that government should protect the freedom and property of individuals. Most liberals accept that individuals have the capacity and the right to live their lives as they wish, free from interference by others. Government is legitimate if it enacts and enforces laws that allow individuals to enjoy the greatest amount of freedom in their lives without affecting the freedom of others. Liberalism has always respected private property as it is seen as integral to allowing individuals the means to express their freedom, and as a bulwark against interference of the state or others. Variations on these basic themes of liberalism are found in the work of Hobbes, Locke, Bentham, and Mill, and these ideas became important politically during the 18th and 19th cents.

As levels of prosperity and education grew in the industrial revolution, greater demand for individual political and property rights promoted the cause of the Liberal Party, the successor to the Whigs (a nickname derive from Whigamore, used in the 17th cent. for Scottish dissenters).

Throughout the 19th century, liberal thinkers and politicians widened their view of how the rights and freedoms of individuals could be protected and promoted, and began to see that laws protecting the freedom of individuals from crimes and interference of other individuals must be combined with policies protecting the freedom of individuals from squalor, hunger, and exploitation. This 'New Liberalism' in the thought of T. H. Green and L. T. Hobhouse influenced the welfare reforms of the great Liberal politicians Lloyd-George and William Beveridge.

This 'New Liberalism' understood that the freedom and rights of individuals could only be secured when combined with commitments to equality and social justice. Whilst New Liberals advocated certain policies similar to the emergent Labour Party, the Liberals retained their commitment to individual property rights, which distinguished them from the socialist commitment to collective ownership and class politics. The strength of working class support for the Labour Party heralded a period of electoral decline for the Liberal Party, interrupted by revivals under the leadership of Jo Grimond (1962), Jeremy Thorpe (1974), David Steel (1979). The 1987 election setback heralded a merger between the Liberals and their SDP Alliance partners. The newly formed Liberal Democrats grew steadily under their leader Paddy Ashdown, rising to become a significant third party. Under Charles Kennedy's leadership they won 62 seats in the 2005 election. After the 2010 election they controversially joined a coalition with the Conservatives. In 2015 they suffered severe losses, retaining only 8 seats. For the 2017 election, *see* **D23**.

Whilst the Liberal Party struggled politically in the 20th cent, liberal beliefs are now arguably dominant politically, socially, and intellectually. The Labour and Conservative parties now both promote explicitly liberal policies, eschewing collective ownership, and socially conservative attitudes respectively. Liberal political philosophy has flourished since the publication of John Rawls's *Theory of Justice*, and many liberals are now motivated to spread their commitments to individuals' rights, legitimate democratic government, and social justice across the globe.

Libertarianism is the view that the moral and material benefit of individuals is best served by a society devoid of government except for the enforcement of rights to life and property. In this way libertarianism differs from anarchism, which argues for the abolition of all authority and government. Famous contemporary libertarians, such as Hayek and Nozick, argue that the pursuit of social justice by the state endangers individual liberty, and threatens tyranny. They argue for a society which operates much like an ideal market where a natural equilibrium of individuals' interests will provide for each person's needs.

Libertarianism's affection for the market has influenced neoliberalism (*q.v.*). Libertarians disagree with modern liberals on the importance of social justice. Liberals argue that there is a moral duty to seek greater equality, and they embrace democratic institutions as appropriate structures through which to promote social justice. Libertarians need to explain either why social justice is not important, or how it can be achieved without democratic political institutions.

Literary Theory. Modern literary theory is concerned with ways in which meaning is constructed and with ideological influences. It challenges received notions of imagination and inspiration, moral significance, and the personality of the author. Its origins lie partly in semiology and formalism, which concentrate on the actual words and structure of a literary text.

Marxism is also important in the works of such critics as Georg Lukács and Louis Althusser. Later approaches include structuralism and post-structuralism. Feminism has become an increasingly significant form of criticism. Other theories are New Historicism, which examines social and cultural contexts, and Reader-Response Criticism, which analyses readers' constructions of meaning.

Logical Positivism, a school of philosophy founded in Vienna in the 1920s by a group known as "the Vienna circle": their work was based on that of Ernst Mach, but dates in essentials as far back as Hume. Of the leaders of the group, Schlick was murdered by a student, Wittgenstein came to Britain, and Carnap went to America following the entry of the Nazis. Briefly the philosophy differs from all others in that, while most people have believed that a statement might be (*a*) true, or (*b*) false, logical positivists consider there to be a third category; a statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, *i.e.*, those in which the statement is merely a definition of the subject, such as "a triangle is a three-sided plane figure" ("triangle" and "three-sided plane figure" are the same thing); and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy; in particular it excludes the possibility of metaphysics.

Thus the question as to whether there is a God or whether free-will exists is strictly meaningless for it is neither a tautological statement nor can it be tested by sense experience.

Lollards, a body of religious reformers and followers of Wyclif who were reviled and persecuted in the reign of Richard II. The name "Lollard" comes from a Flemish word meaning "mutterer"—a term of contempt used to describe the sect. Under Henry V, determined efforts were made to crush the Lollards. Their leader, Sir John Oldcastle, was burnt at the stake (December 1417).

Low Church, term formerly applied to those Anglicans most sympathetic to Protestant nonconformity (*i.e.*, the opposite of the High Church Anglo-Catholics).

Lutheranism. The Reformation had a long history before it became, under Luther and Calvin, an accepted fact. The mediaeval Church had held (as the Catholic Church holds today) that the sacraments were the indispensable means of salvation. Since these were exclusively administered by the clergy, any movement which attacked clerical abuses was forced by sheer necessity to deny the Church's exclusive control of the means of salvation, before it could become free from dependence on a corrupt priesthood. Hence the Albigenses and the Waldenses (*qq.v.*), the followers of John Hus and Wycliff (*see* **Anticlericalism**), were bound to deny the authority of the Church and emphasise that of the Bible. Luther began his movement primarily in order to reform the Church from its gross abuses and the famous ninety-five theses of 1517 were not primarily theological but moral complaints dealing with the actual behaviour of the clergy rather than Church beliefs.

Luther began with the support of the peasants who were genuinely shocked at the abuse of indulgences and other matters, but ended up by being supported by the noblemen who wanted to destroy the power of the pope over the German states and looked forward to confiscating the lands and property of the Church. When the peasants wanted the reform of actual economic abuses relating to the feudal system, Luther took the side of the nobles against them. The contemporary movement in Switzerland led by Ulrich Zwingli had no such secular support, and Zwingli was killed in 1531.

Martin Luther (1483–1546) was the son of a miner in Eisleben in Saxony, entered the order of Augustinian Friars in 1505, and later taught at the newly founded university of Wittenberg. After the publication of the theses the real issue so far as the Church was concerned was whether he was willing or not to submit to the authority of his superiors; Luther refused to compromise with his conscience in the famous words: "Here I stand; I can do no other." In a further statement Luther recommended the formation of a German national church, the abolition of indulgences and other means whereby Rome obtained money from Germany, and an end to the celibacy of the clergy. For this he was naturally excommunicated.

His teaching was based on the German translation of the Bible, but he was by no means a fundamentalist: *e.g.*, he denied that the Book of Hebrews was written by Paul, would have nothing to do with the Apocrypha, and regarded the letter of James as "an epistle of straw." The Scriptures were open to all and could be interpreted by private judgment enlightened by the Spirit of God. One of Luther's key beliefs was Justification by Faith.

Calvin and Luther. Like Calvin, Luther was a predestinarian and determinist, but he was also a conservative and soon became alarmed about the position taken by many extremists once the Reformation was under way. He had really wanted the Church to reform itself, but when he alienated Rome he had perforce to rely more and more on the secular powers which finally resulted in the state-church form which became pronounced in Prussia and later elsewhere.

Whereas Calvin wished the Church to be at least the equal of the State and in some respects its superior, Luther's rebellion resulted in the reverse, a state-controlled episcopalianism.

In 1999 the Lutheran World Federation and the Vatican agreed a historic "Common Statement" on the doctrine of justification. *See also* **Calvinism, Presbyterianism**.

Lycanthropy, the delusion that men may, by the exercise of magical powers or because of some inherited affliction, occasionally transform into wolves. The so-called werewolf is an important feature of mid-European folklore and much the same can be said of the were-tigers and were-bears of Africa and the Far East. Man's fear of werewolves can be seen in prehistoric rock carvings dating back 30,000 years.

M

McLuhanism. According to Marshall McLuhan (1911–80), a Canadian, and former professor of English at Toronto, the *way* people communicate is more important than *what* they communicate: hence his famous slogan, "the medium is the message." There have been two great landmarks in human understanding since we learnt to speak and write: the invention of the printed book and the present digital revolution. The printed word took us step by step along the linear, logical path to understanding; television comes at us from all directions at once and now computers have overthrown the regime of "time' and "space'.

McLuhan's importance lies in alerting us to the present clash between two great technologies, the literate and the electromagnetic, and in his vision, beyond the present chaos, of a world drawn tighter together in a "global village" where identity will merge in collectivity and we shall all be able to co-operate for the common good.

Magic, a form of belief originating in very early days and based on early humans' inability to distinguish between similarity and identity. The simplest example would perhaps be the fertility rites in which it is believed that a ceremony involving sexual relations between men and women will bring about fertility in the harvest. Or the idea that sticking pins in an image of an individual will bring about harm or even death to the real person. Magic is regarded by some as a form of early science in that man in his efforts to control Nature had recourse to magical practices when the only methods he knew had failed to bring the desired results. It filled a gap. By others magic is regarded as an elementary stage in the evolution of religion. It can be said to have served a purpose there too. Yet magic differs from religion: religion depends upon a power *outside and beyond* human beings, whereas magic depends upon nothing but the casting of a spell or the performance of a ceremony.

The idea that "like produces like" is at the roots of imitative magic. It follows that an event can be compelled by imitating it. One engages in swinging, not for pleasure, but to produce a wind as the swing does; ball games are played to get rainy weather because the black ball represents dark rainclouds; other ball games, in which one attempts to catch the ball in a cup or hit it with a stick, represent the sexual act (as some gentlemen at Lords may be distressed to hear) and bring about fertility; in medicine until a few centuries ago herbs were chosen to cure a disease because in some respects their leaves or other parts looked like the part of the body affected. *See* **Witchcraft** and **Demonism**.

Malthusianism, the theory about population growth put forward by the Rev. Thomas Malthus (1766–1834) in *An Essay on Population* (1798). His three main propositions were (1) "Population is necessarily limited by means of subsistence." (2) "Population invariably increases where means of subsistence increase unless prevented by some very powerful and obvious checks." (3) "These checks, and the checks which repress the superior power of population, and keep its effects on a level with the means of subsistence, are all resolvable into moral restraint, vice and misery."

In other words, no matter how great the food supply may become, human reproductive power will always adjust itself so that food will always be scarce in relation to population; the only means to deal with this is by "moral restraint" (*i.e.*, chastity or not marrying), "vice" (*i.e.*, birth-control methods), or misery (*i.e.*, starvation).

More specifically, Malthus claimed that while food increases by arithmetical progression, population increases by geometrical progression. It is true that these gloomy predictions did not take place in Malthus's time largely owing to the opening up of new areas of land outside Europe, the development of new techniques in agriculture, the growth of international trade to poorer areas, the increased knowledge of birth-control, and developments in medical science which reduced the misery he had predicted.

Furthermore, we now know that as a society becomes industrialised its birth-rate tends to fall. The world's population has increased from about 465 million in 1650 to reach 7·2 billion today.

Manichaeism, an Asiatic religion which developed from Zoroastrianism (*q.v.*) and shows the influence of Buddhism (*q.v.*) and Gnosticism (*q.v.*), being founded by Mani, a Persian who was born in Babylonia, *c.* 216 A.D. Mani presented himself to Shapur I as the founder of a new religion which was to be to Babylonia what Buddhism was to India or Christianity to the West.

His aspiration was to convert the East and he himself made no attempt to interfere directly with Christianity although he represented himself as the Paraclete (the Holy Ghost or "Comforter") and, like Jesus, had twelve disciples. His success in Persia aroused the fury of the Zoroastrian priests who objected to his reforming zeal towards their religion and in 276 Mani was taken prisoner and crucified.

Of Mani's complicated system little can be said here, save that it is based on the struggle of two eternal conflicting principles, God and matter, or light and darkness. Although its founder had no intention of interfering with the West, after his death his followers soon spread the religion from Persia and Mesopotamia to India and China. It reached as far as Spain and Gaul and influenced many of the bishops in Alexandria and in Carthage where for a time St. Augustine accepted Manichaeism. Soon the toleration accorded it under Constantine ended and it was treated as a heresy and violently suppressed. Yet it later influenced many heresies, and even had some influence on orthodox Catholicism which had a genius for picking up elements in other religions which had been shown to appeal to worshippers provided they did not conflict with fundamental beliefs.

Maoism is the branch of communism in China that was shaped by one of the most remarkable statesmen of modern times, Mao Tse-tung (Mao Zedong) (1893–1976). He set the pattern of revolution for poor peasant societies despite the traumas of the "Great Leap Forward" and the Cultural Revolution. Although Marxist theory guided the Chinese communists in their struggle for liberation from the old, bourgeois and feudal China, it was interpreted in a manner peculiar to China and developed to fit into the Chinese way of life and the "thoughts" of Chairman Mao. As early as 1926 Mao had pointed out that the Chinese proletariat had in the peasantry its staunchest and most numerous ally.

The struggles of 1925–49 (the Long March of the Red Army, the Anti-Japanese War, the Civil War against Chiang Kai-shek) were the foundations on which present-day China has been built. Great efforts were made to remove poverty, ignorance, corruption *etc.* from China. Mao taught that struggle is necessary for the revolution to endure.

However, disillusion with Maoism intensified during the ultra-leftist Cultural Revolution of 1966 to 1976. The radical chaos was ended only by the death of Mao on 9 September 1976.

The decades since the death of Mao Tse-tung have seen a huge shift towards the modernisation of China and the rapid onset of capitalism but with the Communist hierarchy still in control.

However, the terrible excesses of the regime, in which millions died, have caused historians to cast Mao as another Stalin, a tyrant of his time.

Maronites, Christian sect which appeared in Syria in the 6th cent. They are the largest Christian group in Lebanon. The Maronite patron saint is the Syrian monk Maron (d. *c* 410). The Maronites retain ancient Eastern rites.

Marxism. The sociological theories founded by Karl Marx and Friedrich Engels on which modern communist thought is based. Marx and Engels lived in a period of unrestrained capitalism when exploitation and misery were the lot of the industrial working classes, and it was their humanitarianism and concern for social justice which inspired their work. Marx wrote his *Communist Manifesto* in Brussels in 1848 and in his *Das Kapital* (1867), he worked out a new theory of society. Marx showed that all social systems are economically motivated and change as a result of technical and economic changes in methods of production.

The driving force of social change Marx found to be in the struggle which the oppressed classes wage to secure a better future.

Thus in his celebrated theory of historical materialism he interpreted history in terms of economics and explained the evolution of society in terms of class struggle. (*See* **Dialectical Materialism**.) "In the social production of their means of existence," he wrote, "men enter into definite and unavoidable relations which are independent of their will. These productive relationships correspond to the particular stage in the development of their material productive forces." Marx's theory of historical materialism implies that history is propelled by class struggle with communism and the classless society as the final stage when man will have emancipated himself from the productive process. Marx was the first to put socialism on a rational and scientific basis, and he foretold that socialism would inevitably replace capitalism.

His prophecy, however, came to realisation not in the advanced industrial countries as he had envisaged but in Russia and China. *See* **Communism**.

Materialism. Any theory that tends to the view that only matter or material objects exist and that everything else, notably minds and mental experiences, can be described in material terms. Materialism is thus opposed to dualism or idealism and, in general, to any belief in God, in disembodied spirits *etc.* There is much contemporary philosophical debate as to whether "consciousness" is not a name for something mysterious, but simply a way of talking about the brain. *See also* **Mind and Matter**.

Mechanism. As a theory, the view that everything happens mechanically, that natural phenomena are to be explained by reference to certain laws of nature applied to the behaviour of matter in motion. Through the influence of science, there is a strong tendency in Western thought to compare the universe or parts of it, even human beings, to machines.

Mennonites, a Christian sect rejecting infant baptism. Named after Menno Simons (1496 1559). Its members reject military service and refuse to hold public office. Hutterites share their beliefs. The Amish community, based from the 1700s in Pennsylvania, split from the Mennonites.

They take the Bible literally and at home speak a German language, Pennsylvania Dutch. There are *c.* 500 colonies in North America. Its last church closed in Britain in 2016, but its work continues online.

Mercantilism. Commercial policy pursued by England. Holland and other European nations in the 16th and 17th centuries, as nations expanded the commercial sectors of their economies and a shift of emphasis towards trade and away from domestic agriculture occurred. The policy was aimed at securing an inflow of precious metals and raw materials in return for an outflow of finsihed goods.

Mesmerism, a rapidly vanishing name to denote the practice of hypnosis, which owes its popularity, though not its discovery, to the Austrian physician, Anton Mesmer (1733–1815). Mesmer's contribution was the realisation that a large number of what we would today call psychosomatic or hysterical conditions could be cured (or at least temporarily alleviated) by one or another form of suggestion. Mesmer himself relied on the idea of what he called "animal magnetism," a supposedly potent therapeutic force emanating from the living body which could be controlled by the trained individual.

Mesmer used wands and impressive gadgetry to dispense the marvellous force and he effected a remarkable number of cures of complaints, hitherto looked upon as incurable or totally mysterious in origin—the most typical of these being hysterical blindness, paralysis or deafness, nervous skin conditions, and so on. Hypnosis, which is a valid if very poorly understood psychological phenomenon even today, would probably have been developed much further had not efficient general anaesthetics such as ether, nitrous oxide, *etc.*, been discovered, thus greatly diminishing its role as a pain reliever in surgery. Mesmer, who was three parts charlatan, never really troubled to think deeply about the cause of his undoubted success.

The first man to treat hysteria as a formal class of illness and who made a scientific attempt to treat it with hypnosis was Ambrose Liébeault (1823–1904). He and his colleague Hippolyte Bernheim (1840–1919) believed: (*a*) that hysteria was produced by suggestion, and particularly by autosuggestion on the part of the patient, and (*b*) that suggestion was a normal trait found in varying degrees in everyone. These conclusions are true, but as Freud showed later are far from being the whole truth.

Research published in 2008 showed that hypnosis can indeed work—by producing measurable changes in areas of the human brain linked to memory. Hypnosedation may, for example, reduce the need for general anaesthetic in patients.

Messianism. Most varieties of religious belief rely on the assumption that the deity is a supernatural being either permeating the universe or dwelling in some other sphere, and normally inaccessible to man. Where divine intervention is necessary, the deity is traditionally believed to nominate a human being—in the case of Christianity, for example, Jesus is believed to be the actual son of God. Messianic cults introduce a novel variant on the traditional theme. In these a human being is held to be God himself. He may either nominate himself for this role, relying on his own personality or native talent to acquire the necessary following, or for one reason or another large numbers of people may alight on one individual and declare him the Messiah. While it might seem that beliefs of this kind would be confined to earlier epochs in man's history, this is not the case.

Metapsychology. Not to be confused with parapsychology (*q.v.*). The branch or off-shoot of psychology which goes beyond empirical and experimental studies to consider such philosophical matters as the nature of mind, the reality of free-will and the mind/body problem. It was originally used by Freud as a blanket descriptive term denoting all mental processes, but this usage is now obsolete.

Methodism, the religious movement founded by John Wesley in 1738, with the aim of spreading "scriptural holiness" throughout the land. Up to that time Wesley had been a High Churchman but on a visit to Georgia in the United States he was much impressed by the group known as Moravians (*q.v.*), and on his return to this country was introduced by his brother Charles, who had already become an adherent, to Peter Böhler, a Moravian minister in England. Passing through a period of spiritual commotion following the meeting, he first saw the light at a small service in Aldersgate in May 1738 "where one was reading Luther's preface to the Epistle to the Romans" and from this time all Wesley's energies were devoted to the single object of saving souls.

Early Methodism. Soon Whitefield, a follower with Calvinist views, was preaching throughout the country and Charles Wesley was composing his well-known hymns; John's abilities at this time were taken up in the movement described as "People called Methodists." They were to be arranged in "societies" which were united into "circuits" under a minister, the circuits into "districts" and all knit together into a single body under a conference of ministers which has met annually since 1744. Local lay preachers were also employed and to maintain interest the ministers were moved from circuit to circuit each year.

These chapel services were not originally meant to conflict with the Church of England of which Wesley still considered himself a member. They were purely supplementary, and it used to be the custom (before the Methodists began to count themselves as Nonconformists) for Methodists to attend Church in the morning and Chapel in the evening.

The class-meeting was the unit of the organisation where members met regularly under a chosen leader to tell their "experiences" upon which they were often subjected to severe cross-examination. At the end of every quarter, provided their attendances were regular, they received a ticket of membership which entitled them to come to monthly sacramental services. If attendance was inadequate the name was removed from the list, without appearance on which nobody was deemed a member. The price of the ticket was "a penny a week and a shilling a quarter" but Wesley was not interested in receiving money from anyone who was not utterly devoted to the cause.

The Work of Wesley. John Wesley introduced four other innovations, some of which were regarded by Churchmen who had previously been willing to commend his efforts in bringing religion to the poorer classes as dangerous: (1) He started the Sunday-school scheme and afterwards enthusiastically supported that of John Raikes, often regarded as the founder of the idea; this was of immense importance in the days before the Education Acts. (2) He reintroduced the Agapae or "love feasts" of the early Church which were fellowship meetings deepening the sense of brotherhood of the society. (3) He began to copy the open-air meetings of the eloquent Whitefield and soon unwittingly produced the most extraordinary results, finding that his sermons led to groans, tears, fainting fits, and all sorts of emotional expression. Even his open-air lay speakers produced like results and these came to be associated with Methodism and gave significance to the proud Anglican claim that *their* services would be "without enthusiasm." (4) After some hesitation he ventured to consecrate Dr. Thomas Coke, who was being sent as a missionary to America, as a bishop of his church. In addition to Wesley's religious work he was a great educator of the common man. Thus he introduced the cheap book and the church magazine, publishing books of any sort which he thought would edify and not harm even when the views expressed were different from his own—*e.g.*, Thomas à Kempis's *Imitation of Christ* and works of history, biography, science, and medicine in some cases written by himself. In this way the movement with its cheap books and reading rooms had an influence far beyond its actual membership. Both the Anglican Church and the Evangelical movement of Wilberforce and others profited from Wesley's work.

Later Schisms. Methodism, especially after Wesley's death in 1791, began, like other movements, to develop schisms. These were the long-standing differences which the Baptist movement (*q.v.*) had shown too between Arminian and Calvinist sections—*i.e.*, between those who did and those who did not accept the doctrine of predestination. In the case of the Methodists, this led to a complete break in 1811. Then there were differences associated with the status of the laity, or the relationship of the movement with the Anglican Church. The "Methodist New Connection" of 1797 differed only in giving the laity equal representation with the ministers but the more important break of the Primitive Methodists in 1810 gave still more power to the laity and reintroduced the "camp-meeting" type of service. In 1815 the Bryanites or "Bible Christians" were formed, and a further schism which was even brought before the law courts was ostensibly over the foundation of a theological college. The real reason, of course, was that the ministers were becoming more Tory, whilst the laity were becoming more Radical. Finally in 1932, the Wesleyan Methodists, the Primitive Methodists, and the United Methodists became one Church, the Methodist Church.

Adult Methodist membership has fallen recently, with numbers down to nearly 200,000 (the lowest since 1819).

During 1998, Methodists began the first formal steps towards talks with Anglicans about reunion. Earlier attempts to unite with the Anglicans in 1969 and 1972 ended in failure. The present initiative has not met with success.

The Methodist Church has separately agreed to bless gay couples "married" under the civil partnership law. The Methodist Church has also issued an "unreserved apology" over the large number of historical child abuse cases that have been uncovered.

The World Methodist Council supports the autonomous Methodist churches in the world.

Millenarianism. The belief in a future "millenium", that is, the thousand year reign of Christ on earth. The idea however has pre-Christian roots and is reflected in Jewish and Islamic thought. It is not part of orthodox Christianity, but many sects in the 19th century, like the Plymouth Brethren and Adventists, espoused millenarianism. The idea has since broadened to mean any theory with an expectation of some transforming change: not only the Kingdom of God, but also the just society, harmony among peoples *etc*.

Mind and Matter. Early peoples could see that there is a distinction between those things which move and do things by themselves and others, such as stones, which do not. Following the early state of **Animism** (*q.v.*), in which spirits were believed to have their abode in everything, they began to differentiate between matter or substance and a force which seems to move it and shape it into objects and things. Thus to the Greek Parmenides (fl. *c.* 475 B.C.), who was a philosopher of pure reason, thought or mind was the creator of what we observe and in some way not quite clear to himself it seemed that mind was the cause of everything. This is perhaps the first expression of the movement known as Idealism which says, in effect, that the whole universe is mental—a creation either of our own minds or the mind of God. But from Anaxagorus (488–428 B.C.) we have the clearer statement that mind or *nous* causes all movement but is distinct from the substance it moves. He does not, however, think in terms of individual minds but rather of a kind of generalised mind throughout the universe which can be used as an explanation of anything which cannot be explained otherwise. This is the position known as Dualism (*see below*) which holds that both mind and matter exist and interact but are separate entities.

Dualism. Most people in practice are dualists since, rightly or wrongly, mind and body are thought of as two different things: it is the "commonsense" (although not necessarily the true) point of view. Plato in a much more complex way was also a dualist although he held that the world of matter we observe is in some sense not the genuine world. The real world is the world of ideas and the tree we see is not real but simply matter upon which mind or soul has imprinted the idea of a tree. Everything that exists has its corresponding form in the world of ideas and imprints its pattern on matter. Mind has always existed and, having become entangled with matter, is constantly seeking to free itself and return to God.

Plato's pupil Aristotle had a much more scientific outlook and held that, although it was mind which gave matter its form, mind is not *outside* matter, as Plato had thought, but *inside* it as its formative principle. Therefore there could be no mind without matter and no matter without mind; for even the lowest forms of matter have some degree of mind which increases in quantity and quality as we move up the scale to more complex things.

So far, nobody had explained how two such different substances as matter and mind could influence each other in any way, and this remains, in spite of attempts to be mentioned later, a basic problem in philosophy.

Two later ideas, one of them rather foolish and the other simply refusing to answer the question, are typified by the Stoics and some members of the Sceptic school. The first is that only matter exists and what we call mind is merely matter of a finer texture, a view which as an explanation is unlikely to satisfy anyone; the other, that of some Sceptics, is that we can know nothing except the fleeting images or thoughts that flicker through our consciousness. Of either mind or matter we know nothing.

Renaissance Attitude. Christian doctrines have already been dealt with (*see* **God and Man, Determinism and Free-will**), and the past and future of the soul is dealt with under **Immortality**. Nor need we mention the Renaissance philosophers who were really much more concerned about how to use mind than about its nature. When they did consider the subject they usually dealt with it, as did Francis Bacon, by separating the sphere of science from that of religion and giving the orthodox view of the latter because there were still good reasons for not wishing to annoy the Church.

Hobbes and Descartes. Thomas Hobbes in the 17th cent. was really one of the first to attempt a modern explanation of mind and matter even if his attempt was crude. As a materialist he held that all that exists is matter and hence our thoughts, ideas, images, and actions are really a form of motion taking place within the brain and nerves. This is the materialist theory which states that mind does not exist.

Thus there are three basic theories of the nature of mind and body: idealism, dualism, and materialism, and we may accept any one of the three. But, if we accept dualism, we shall have to explain precisely the relationship between body and mind. In some of his later writings Hobbes seems to suggest that mental processes are the effects of motion rather than motion itself; *i.e.*, they exist, but only as a result of physical processes just as a flame does on a candle. This theory of the relationship is known as *epiphenomenalism*.

Descartes, the great French contemporary of Hobbes, was a dualist who believed that mind and matter both exist and are entirely different entities; therefore he had to ask himself how, for example, the desire to walk leads to the physical motion of walking. His unsatisfactory answer was that, although animals are pure automatons, man is different in that he has a soul which resides in the pineal gland (a tiny structure in the brain which today we know to be a relic of evolution with no present function whatever). In this gland the mind comes in contact with the "vital spirits" of the body and thus there is interaction between the two. This theory is known as *interactionism*, and since we do not accept its basis in the function of the pineal gland, we are simply left with the notion of interaction but without the explanation of how it takes place.

Guelincx. One of Descartes's successors, Arnold Guelincx, produced the even more improbable theory of *psychophysical parallelism* sometimes known as the theory of the "two clocks". Imagine you have two clocks, each keeping perfect time, then supposing you saw one and heard the other, every time one points to the hour the other will strike, giving the impression that the first event causes the second, although in fact they are quite unrelated. So it is with the body and mind in Guelincx's view, each is "wound up" by God in the beginning in such a way as to keep time with the other so that when I have the desire to walk, purely unrelated physical events in my legs cause them to move at the same time. A variety of this theory is *occasionism*, which says that when something happens in the physical world, God affects us so that we *think* we are affected by the happening.

The trouble about all these theories is (*a*) that they really explain nothing, and (*b*) that they give us a very peculiar view of God as a celestial showman treating us as puppets when it would surely have been easier to create a world in which mind and matter simply interacted by their very nature. Spinoza, too, believed in a sort of psychophysical parallelism in that he did not think that mind and body interacted. But since in his theory everything is God, mind and matter are simply two sides of the coin.

John Locke, another contemporary, thought of the mind as a blank slate upon which the world writes in the form of sensations, for we have no innate or inborn ideas and mind and matter do interact although he does not tell us how. All we know are sensations—*i.e.*, sense impressions. Bishop Berkeley carried this idea to its logical conclusion: if we know nothing but sensations, we have no reason to suppose that matter exists at all. He was, therefore, an idealist.

The Views of Hume and Kant. David Hume was to go further still and pointed out that, if all we know are sensations, we cannot prove the existence of matter but we cannot prove the existence of mind either. All we can ever know is that ideas, impressions, thoughts, follow each other. We do not even experience a self or personality because every time we look into our "minds" all we really experience are thoughts and impressions. Hume was quick to point out that this was not the same as saying that the self did not exist; it only proved that we cannot know that it does.

Kant made it clear that, although there is a world outside ourselves, we can never know what it is really like. The mind receives impressions and forms them into patterns which conform not to the thing-in-itself but to the nature of mind. Space and time, for example, are not realities but only the form into which our mind fits its sensations. In other words our mind shapes impressions which are no more like the thing in itself than the map of a battlefield with pins showing the position of various army groups at any given moment is like the battlefield. This, of course, is true. From physics and physiology we know that the sounds we hear are "really" waves in the air, the sights we see "really" electromagnetic waves. What guarantee do we have that the source is "really" like the impression received in our brain? Kant was the leader of the great German Idealist movement of the 18th cent. which in effect said: "why bother about matter when all we can ever know is mental?"

Bradley, Bergson and Strawson. The Englishman Bradley, and the Frenchman Henri Bergson in the 19th and early 20th cent. both held in one form or another the belief that mind in some way creates matter and were, therefore, idealists, whereas Comte, the positivist (*q.v.*), and the Americans William James and John Dewey, held that mind is a form of behaviour. Certain acts (*e.g.*, reflexes) are "mindless" because they are deliberate; others which are intended may be described for the sake of convenience as "minded" (*i.e.*, purposeful). But like the majority of modern psychologists—insofar as they take any interest in the subject—they regarded mind as a process going on in the living body. Is there any reason, many now ask, why we should think of mind as being any different in nature from digestion? Both are processes going on in the body, the one in the brain the other in the stomach and intestines. Why should we therefore regard them as "things"?

Peter Strawson's *Individuals* (1959) refreshed several key Kantian arguments, and combined them with an original analytic vigour that helped make the work important and influential in contemporary discussions of mind and matter. Strawson presented a transcendental argument for the necessity of material bodies as the basic particular to the possibility of existence and experience. Persons are able to think of themselves and each other because of our nature as material individuals, as we can cognise and recognise ourselves and others only because of our material embodiment.

Strawson's arguments are controversial to some who follow a more Humean notion of personal identity, but they have inspired a new generation of philosophers to employ transcendental arguments in an attempt to establish the relationship between mind and matter.

Mithraism, a sun-religion which originated in Persia with the worship of the mythical Mithra, the god of light and of truth. It was for two centuries one of early Christianity's most formidable rivals, particularly in the West since the more philosophical Hellenic Christianity of the East had little to fear from it. (Arnold Toynbee has described Mithraism as "a pre-Zoroastrian Iranian paganism—in a Hellenic dress"; Manichaeism as "Zoroastrianism—in a Christian dress".) Mithraism was a mystery faith with secret rites known only to devotees. It appealed to the soldiers of the Roman Army which explains its spread to the farthest limits of the Roman empire and its decline as the Romans retreated. The religion resembled Zoroastrianism (*q.v.*) in that it laid stress on the constant struggle between good and evil and there are a number of parallels with Christianity, *e.g.*, a miraculous birth, death, and a glorious resurrection, a belief in heaven and hell and the immortality of the soul, a last judgment. Both religions held Sunday as the holy day of the week, celebrated 25 December (date of the pagan winter solstice festival) as the birthday of the founder; both celebrated Easter, and in their ceremonies made use of bell, holy water, and the candle.

Mithraism was to reach its height about 275 A.D. and afterwards declined both for the reason given above and, perhaps, because it excluded women, was emotional rather than philosophical, and had no general organisation to direct its course. Yet even today traces of the religion remain and antiquarians are familiar with the image of the sun-god and the inscription *Deo Soli Mithrae, Invicto, Seculari* (dedicated to the sun-god of Mithra, the unconquered).

Modernism. The term has two main connotations:

1. A movement in the Roman Catholic church, *c.* 1890–1910. The 19th century stress on science and the application of scientific methods in fields like history, psychology and philosophy, raised serious problems for traditional Catholic doctrine. The Modernists sought to reinterpret church teaching in the light of this modern knowledge. The movement was condemned as heresy in 1907.

2. The term is more frequently used to refer to the "modern" movement in all the arts in the period *c.* 1900–30, though defining the period it covers is only one of the problems in describing the movement. It is generally seen as an artistic response to the changes which undermined the securities on which 19th century art and literature were founded. Modernism is marked by a greater ambition for works of art themselves. As well as being novels, or paintings, or music, *etc.*, they were increasingly considered, by artists and critics alike, as representing a theoretical programme, attempts to make the audience see or understand the world in a different way. So modernist characteristics include an increased self-consciousness of the artist, and formal experiment employing a wide variety of technical innovations.

In literature the prime works of modernism are T. S. Eliot's *The Waste Land* and James Joyce's *Ulysses*; the most important painters include Picasso and Matisse; and among composers Schoenberg and Stravinsky stand out.

Mohammedanism. *See* **Islam.**

Monasticism. When in the 4th cent. A.D. Constantine in effect united state and church there were naturally many who hastened to become Christians for the worldly benefits they expected it to bring in view of the new situation. But there were others who, in their efforts to escape from wordly involvement, went into the deserts of North Africa and Syria to live as hermits.

In these regions there grew up large communities of monks whose lives of renunciation made a considerable impression on the Christian world. They were men of all types but the two main groups were those who preferred to live alone and those who preferred a community life. Among the first must be included St. Anthony, the earliest of the hermits, who was born in Egypt *c.* 250 and who lived alone in a hut near his home for fifteen years and then in the desert for a further twenty. As his fame spread Anthony came forth to teach and advocate a life of extreme austerity, until by the end of his life the Thebaid (the desert around Thebes) was full of hermits following his example. (Not unnaturally, he was constantly assailed by lustful visions which he thoughtfully attributed to Satan.) In the Syrian desert St. Simeon Stylites and others were stimulated to even greater austerities and Simeon himself spent many years on the top of a pillar in a space so small that it was only possible to sit or stand.

The first monastery was founded by Pachomius of Egypt *c.* 315 and here the monks had a common life with communal meals, worship, and work mainly of agricultural type. In the Eastern part of the Empire St. Basil (*c.* 360) tried to check the growth of the extreme and spectacular practices of the hermits by organising monasteries in which the ascetic disciplines of fasting, meditation, and prayer, would be balanced by useful and healthy activities. His monasteries had orphanages and schools for boys—not only those who were intended for a monkish life. But the Eastern Church in general continued to favour the hermit life and ascetic extremes.

Western Monasticism. Monastic life was introduced to the West by St. Athanasius in 339 who obtained its recognition from the Church of Rome and St. Augustine introduced it into North Africa beyond Egypt. The movement was promoted also by St. Jerome, St. Martin of Tours, who introduced it into France, and St. Patrick into Ireland. The monastery of Iona was founded by St. Colomba in 566. But it must be remembered that the Celtic Church had a life of its own which owed more to the Egyptian tradition than to Rome. Unlike the more elaborate monasteries of the Continent those of the early Celtic Church were often little more than a cluster of stone bee-hive huts, an oratory, and a stone cross. It had its own religious cere-monies and its own art (notably its beautifully carved crosses and the illuminated manuscripts such as the Lindisfarne Gospel (*c.* 700) and the Irish Book of Kells dating from about the same time). The Scottish St. Ninian played a major part in introducing Egyptian texts and art to Britain where, mixed with Byzantine influences and the art of the Vikings, it produced a typical culture of its own.

Strangely enough, it was the Celts who played almost as large a part in preserving civilisation in Europe during the Dark Ages as the Italians have since. It was St. Columbanus (*c.* 540–615) who founded the great monasteries of Annegray, Luxeuil, and Fontaine in the Vosges country, St. Gall in Switzerland, and Bobbio in the Apennines. So, too, it was the Anglo-Saxon Alcuin (*c.* 735–804) who was called from York by Charlemagne to set up a system of education throughout his empire; the most famous of the monastic schools he founded was at Tours. Among those influenced by him was the philosopher John Scotus Erigena.

Meanwhile from the south, as the disintegrating Roman empire became increasingly corrupt, St. Benedict of Nursia (*c.* 480–*c.* 543) fled the pleasures of Rome to lead a hermit's life near Subiaco. Here he founded some small monasteries, but *c.* 520 made a new settlement, the great monastery of Monte Cassino in southern Italy, where he established a "Rule" for the government of monks. This included both study and work and emphasised that education was necessary for the continuance of Christianity. As his influence spread his Rule was adopted by other monasteries, and schools became part of monastic life. Outside the Roman Catholic Church, both Eastern Orthodox and Anglican Christians owe much to the monastic movement.

Monasticism, is not peculiar to Christianity and forms a major aspect of Buddhism, especially in the form of Lamaism (*q.v.*) in Tibet.

Monophysitism, a heresy of the 5th cent. which grew out of a reaction against Nestorianism (*q.v.*). The majority of Egyptian Christians were Monophysites (Mono-physite = one nature)—*i.e.* they declared Christ's human and divine nature to be one and the same. This view was condemned at the Council of Chalcedon (A.D. 451) which pronounced that Jesus Christ, true God and true man, has two natures, at once perfectly distinct and inseparably joined in one person and partaking of the one divine substance. However, many continued to hold Monophysite opinions, including the Coptic Church (*q.v.*), declaring the Council to be unoecumenical (*i.e.* not holding the views of the true and universal Christian Church).

Montanism, a Phrygian form of primitive Puritanism with many peculiar tenets into which the early Christian theologian Tertullian (*c.* 150–*c.* 230) was driven by his extremist views that the Christian should keep himself aloof from the world and hold no social intercourse whatever with pagans. The sect had immediate expectation of Christ's second coming and indulged in prophetic utterance which they held to be inspired by the Holy Ghost but which their enemies put down to the work of the Devil.

Moonies. *See under* **Unification Church, J51–2.**

Moral Re-Armament, a campaign launched in 1938 by an American evangelist of Lutheran background, Frank N. D. Buchman (1878–1961), founder of the Oxford Group Movement, and at first associated with the First Century Church Fellowship, a fundamentalist Protestant revivalist movement. On a visit to England in 1920 Buchman preached "world-changing through life-changing" to undergraduates at Oxford, hence the name Oxford Group.

Two of the Group's most typical practices were group confession of sins openly and the "quiet time" set aside during the day to receive messages from the Almighty as to behaviour and current problems. In the eyes of non-Groupers the confession (often of trivial sins) appeared to be exhibitionist and there was felt to be a certain snobbery about the movement which made it strongly conscious of the social status of its converts.

The Oxford Group gave way to Moral Re-Armament, the third phase of Buchmanism. MRA is open to all. Its starting point is the readiness of each person to make real in their own life the changes they wish to see in society. A commitment to search for God's will in daily life forms the basis for creative initiative and common action. Absolute moral standards of honesty, purity, unselfishness and love help to focus the challenge of personal and global change.

The peak of public interest in MRA was probably reached in the 1950s. The phrase "moral rearmament" was coined by the English scientist W. H. Bragg and appropriated by Buchman.

Moravian Church, a revival of the Church of the "Bohemian Brethren" which originated (1457) among some of the followers of John Hus. It developed a kind of Quakerism that rejected the use of force, refused to take oaths, and had no hierarchy. It appears to have been sympathetic towards Calvinism but made unsuccessful approaches to Luther. As a Protestant sect it was ruthlessly persecuted by Ferdinand II and barely managed to survive. However, in the 18th cent. the body was re-established by Count Zinzendorf who offered it a place of safety in Saxony where a town called Herrnhut (God's protection) was built and this became the centre from which Moravian doctrine was spread by missionaries all over the world. Their chief belief (which had a fundamental influence on John Wesley—*see* **Methodism**) was that faith is a direct illumination from God which assures us beyond all possibility of doubt that we are saved, and that no goodness of behaviour, piety, or orthodoxy is of any use without this "sufficient sovereign, saving grace".

Mormons, or **Latter-day Saints**. *See under* **Church of the Latter Day Saints.**

Muggletonians, one of many sects which arose during the Commonwealth but, unlike most of the others (**Levellers** (*q.v.*), **Diggers** (*q.v.*, Fifth Monarchy Men, and the Millenarians) which tended to have a strongly political aspect, this was purely religious. Founded by two journeymen tailors, Lodowick Muggleton and John Reeve, who interpreted the Book of Revelation in their own peculiar way, it was decided that Reeve represented Moses, and Muggleton, Aaron.

They also believed that the Father, not the Son, had died on the cross (an ancient heresy) but added the strange statement that He left Elijah in control during His period on earth. Rejecting the doctrine of the Trinity, they also asserted that

God has a human body.

Multiculturalism. Liberal democracy concentrates on the rights, obligations, and welfare of individuals. Critics argue that this focus on individuals ignores the special needs and identities of groups. Multiculturalism is the view that the state should acknowledge the importance of identity conferring groups, and create a legal and political order in which the multiplicity of groups in any society are allowed to practice their own distinct cultures within the boundaries of mutual respect. Such groups may be based on ethnicity, gender, sexuality, language, or religion.

Multiculturalists may also support special exemptions or privileges for groups, on the grounds that their identity and interests would otherwise be threatened. Examples include recent debates about the wearing of religious clothing in state schools and positive discrimination in the workplace. Opponents of multiculturalism argue that this destroys the shared unity and values of society. Liberals also regard multiculturalism as a nefarious obstruction on the rights of individuals to choose their own identity, and not have it prescribed by others.

Mystery Religions. *See* **Orphism.**

Mysticism, a religious attitude which concerns itself with direct relationship with God, "reality" as contrasted with appearance or the "ultimate" in one form or another. All the higher religions have had their mystics who have not always been regarded without suspicion by their more orthodox members, and, as Bertrand Russell points out, there has been a remarkable unity of opinion among mystics which almost transcends their religious differences. Thus, characteristic of the mystical experience in general, have been the following features; (1) a belief in insight as opposed to analytical knowledge which is accompanied in the actual experience by the sense of a mystery unveiled, a hidden wisdom become certain beyond the possibility of doubt; this is often preceded by a period of utter hopelessness and isolation described as "the dark night of the soul"; (2) a belief in unity and a refusal to admit opposition or division anywhere; this sometimes appears in the form of what seem to be contradictory statements: "the way up and the way down is one and the same" (Heraclitus). There is no distinction between subject and object, the act of perception and the thing perceived; (3) a denial of the reality of time, since if all is one the distinction of past and future must be illusory; (4) a denial of the reality of evil.

Among the many great mystics have been Meister Eckhart and Jakob Boehme, the German religious mystics of the 13th and 16th cent. respectively, Acharya Sankara of India, and St. Theresa and St. John of the Cross of Spain. Mystical movements within the great religions have been: the Zen (*q.v.*) movement within Buddhism; Taoism in China; the Cabalists and Hasidim in Judaism; and the Sufis within Islam.

N

Nation of Islam. The origins of the Nation of Islam (NOI) can be traced back to Noble Drew Ali, born Timothy Drew, who set up the Moorish Science Temple of America in 1926 on the principle that the black people of the United States could only be united by Islam. In 1930, Master Fard Muhammed, claiming to be Drew's reincarnation, set up the Lost-Found Nation of Islam preaching freedom, equality and the idea that America's blacks were a lost tribe of Muslims known as the Shabazz.

Upon Fard's disappearance in 1934, the movement was taken over by the Honourable Elijah Muhammad who was responsible for much of the theology of the movement, as well as its opposition to the Second World War, for which he was imprisoned until 1946. They have a distinct mythology which regards black people as the original races, and white people as the creation of an evil scientist named Yakub. Based on an interpretation of Ezekiel's eschatological vision, at the end time the black races will have a final victory over their oppressors.

In the 1950s the well known civil rights activist Malcolm X became a prominent member but his emphasis on traditional Islam as opposed to radical new Black Islam led to his assassination by NOI members in 1965. This led, within the next decade, to a major examination of the movement, in particular by Wallace D. Muhammad, the son of Elijah Muhammad. He changed the name to the American Muslim Mission, linking it to more mainstream Islam, and dropped many of the racially exclusive policies.

The gap which this left was exploited by Louis Farrakhan, a senior NOI member, who broke with Wallace Muhammad in 1978, and re-founded the Nation of Islam. Farrakhan turned his organisation increasingly militant once more, reinstating a strict dress code, and the personal security force known as the Fruit of Islam. The Million Man March in Washington D.C. in 1995 notably raised the profile of the movement, although subsequently Farrakhan was denied entry to Britain on the grounds that his visit would incite racial tension.

Nationalism. Devotion to one's nation and its interests. Politically, this is translated into the theory that each nationality should be organised in a sovereign state. Nationalism first developed in Western Europe with the consolidation of nation states, and brought about the reorganization of Europe in the 19th and 20th centuries, *e.g.* the unification of Italy, the rise of Germany. At first, nationalism was liberal and democratic in tone, but it has also been associated with national expansion at the expense of other nations, and was an essential element of Fascism. In the 20th century it was important in the political awakening of Asia and Africa against colonialism. In Europe, the collapse of Communist regimes led to a resurgence of nationalism (*e.g.* Serbia).

Natural Law, the philosophical doctrine which states that there is a natural moral law, irrespective of time and place, which man can know through his own reason. Originally a product of early rational philosophy, the Christian form of the doctrine is basically due to St. Thomas Aquinas who defined natural law in relation to eternal law, holding that the eternal law is God's reason which governs the relations of all things in the universe to each other. The natural law is that part of the eternal law which relates to man's behaviour. Catholic natural law assumes that the human reason is capable of deriving ultimate rules for right behaviour, since there are in man and his institutions certain foundations produced by God's reason which man's reason can know to be correct and true. Thus, the basis of marriage, property, the state, and the contents of justice are held to be available to man's natural reason. The rules of positive morality and civil law are held to be valid only insofar as they conform to the natural law, which man is not only capable of knowing but also of obeying.

Protestant theologians criticise this notion. Thus Karl Barth and many others hold that sinful and fallen man cannot have any direct knowledge of God or His reason or will without the aid of revelation. Another theologian Niebuhr points out that the principles of the doctrines are too inflexible and that although they are the product of a particular time and circumstance, they are regarded as if they were absolute and eternal. In fact, as most social scientists would also agree, there is no law which can be regarded as "natural" for all men at all times. Nor does it seem sensible to suppose that all or even many men possess either the reason to discern natural law or the ability to obey it; whether or not we accept man's free-will (and not all Protestant sects do), we know as a fact of science that people are not always fully responsible for their actions and some not at all.

Such basic human rights as freedom of speech and religion, and freedom from fear and want, derive from natural law as developed by Locke.

Naturalism. 1. In general, the view that what is studied by the human sciences is all that there is, and that there is no need to go beyond or outside the universe for any explanation.

2. In ethics, the view that value terms can be defined in terms of neutral statements of fact, or derived from such statements.

Naturism. The world's first nudist club was founded in 1891 by Charles Crawford, a British circuit judge serving in Bombay (Mumbai). *Health and*

Efficiency, the world's first naturist magazine, was founded in 1932.

Nazism, the term commonly used for the political and social ideology of the German National Socialist Party inspired and led by Hitler. The term *Nazi* was an abbreviation of *Nationalsozialistische Deutsche Arbeiterpartei*. Some key dates in the history of Nazism are:

1923 Hitler attempts armed coup in Munich, but fails. Hitler is subsequently arrested.

1924 Hitler convicted of conspiring to commit treason and sentenced to five years' imprisonment. Hitler dictates *Mein Kampf* (My Struggle).

1930 National Socialists win seats in Reichstag.

1933 Hitler appointed Chancellor.

1936 Hitler invades the Rhineland.

1938 Germany annexes Austria in '*Anschluss*', gains partition of Czechoslovakia at Munich.

1939 'Pact of Steel' signed between Germany and Italy. Germany invades Poland, signs pact with Soviet Union.

1940 Germany invades Denmark, Norway, Belgium, Holland, Luxembourg, and France.

1941 Germany invades Yugoslavia, Greece, and Russia.

1942 Wannsee Conference held on 'Final Solution of the Jewish Question.' Persecution of Jews increases across fascist controlled Europe.

1943 Germany destroys Warsaw ghetto after uprising. Italy deports Jews. German forces defeated by British 8th Army in North Africa. Allies invade Sicily. Mussolini arrested, Italy surrenders to Allies. Mussolini freed by German commandos. New Italian government declares war on Germany, which continues to occupy much of Italy.

1944 Allies invade Normandy on D-Day. Assassination attempt by German generals on Hitler narrowly fails. Allies liberate Paris and Rome.

1945 Mussolini assassinated. Allies invade Germany, Nazi death camps liberated. An estimated 6 million Jews were murdered, along with hundreds of thousands of other groups persecuted by the Nazis, including homosexuals, gypsies, disabled people, and Christians. Hitler commits suicide. Germany surrenders on 8 May.

Neocolonialism. *See* **Colonialism**.

Neoconservatism. Whilst sharing such traditional conservative values as patriotic pride, opposition to bureaucratic welfare states, and belief in free trade, neoconservatives differ from traditional conservatives in their views on foreign policy. Particularly strong in American politics, neoconservatives argue that liberal democracy is inherently vulnerable to threats from extreme political ideologies which seek global domination. In order to protect liberal democracy, such states must pursue a policy of military empowerment and intervention against perceived threats. Consequently, neoconservatism's defining feature is the view that liberal democracy must be promoted and protected aggressively in foreign policy. Traditional conservatism, at least in America, tended towards an isolationist foreign policy. Neoconservatives feared such isolationism would lead to appeasement of totalitarianism and increased vulnerability from militarily strong expansionist ideologies, such as Soviet Communism.

Neoconservatives argue that there is a moral obligation on liberal democracies to spread their freedoms around the globe.

Neo-Fascism. *See* **Fascism, J19**.

Neoliberalism. Traditionally, liberalism has prioritised the freedom of the individual and argued that private property is the greatest bulwark against curtailment of an individual's freedom by others. In the late 20th century, neoliberalism developed in response to a perceived assault on individual freedoms that resulted from the pursuit of social justice by social democratic states.

Neoliberals regarded progressive taxation, redistributive fiscal policies, extensive welfare provision, and state ownership of industry as illegitimate and inefficient uses of state power. They criticised particularly the moral and economic dependency encouraged by extensive welfare provision, and argued that welfare discouraged individuals from work and from taking responsibility for the security and prosperity of themselves and their families. Neoliberals such as Thatcher and Reagan argued that the role of the state should be restricted to protecting the freedoms and private property of individuals. Consequently, neoliberals privatised state owned industries and utilities, reduced taxation and public spending, and withdrew welfare support and other redistributive policies. Neoliberalism has come to dominate western electoral politics, and is now promoted in developing nations by such bodies as the IMF, WTO, and World Bank.

Neoplatonism. Movement begun by Plotinus' interpretation of Plato and carried forward by various philosophers of the next three centuries and which had some influence in the Renaissance. Plotinus (205–270) saw reality as hierarchically ordered in a graded series from the divine to the material; man, who contains some part of the divine, longs for union with the highest level. Subsequent Neoplatonists include Porphyry, Iamblichus and Philoponus. (*See also* **Determinism and Free-will** and **God and Man**).

Nestorian Heresy. The 5th cent. of the Christian Church saw a battle of personalities and opinions waged with fanatical fury between St. Cyril, the patriarch of Alexandria, and Nestorius, patriarch of Constantinople. Nestorius maintained that Mary should not be called the mother of God, as she was only the mother of the human and not of the divine nature of Jesus. This view was contradicted by Cyril (one of the most unpleasant saints who ever lived) who held the orthodox view. In addition to his utter destruction of Nestorius by stealthy and unremitting animosity Cyril was also responsible for the lynching of Hypatia, a distinguished mathematician and saintly woman, head of the Neoplatonist school at Alexandria.

As if this were not enough Cyril took pains to stir up pogroms against the very large Jewish colony of Alexandria. At the Council of Ephesus (A.D. 431) the Western Bishops quickly decided for Cyril. This Council (reinforced by the Council of Chalcedon in 451) clarified orthodox Catholic doctrine (*see* **Monophysitism**).

Nestorius became a heretic, was banished to Antioch where he had a short respite of peace, but later, and in spite of his age, was forced to move from one place to another on the borders of Egypt. Later the Nestorian church flourished in Syria and Persia and missions were sent to India and China.

New Age, a quasi-religious movement, based on a millennarian mysticism, astrology and ecology.

New Labour. *See* **Third Way.**

New Liberalism. *See* **Liberalism.**

Nihilism, the name often given to the earliest Russian form of revolutionary anarchism. It originated in the early years of Tsar Alexander II (1818–81), the liberator of the serfs, who, during his attempts to bring about a constitutional monarchy, was killed by a bomb. The term "nihilist", was first used in 1862 by Turgenev in his novel *Fathers and Children*. *See* **Anarchism**.

Nominalism. Early medieval thinkers were divided into two schools, those who regarded "universals" or abstract concepts as mere names without any corresponding realities (Nominalists), and those who held the opposite doctrine (**Realism**) that general concepts have an existence independent of individual things. The relation between universals and particulars was long a subject of philosophical dispute.

The first person to hold the nominalist doctrine was probably Roscelin or Roscellinus in the late 11th cent., but very little is known of him and none of his works remains except for a single letter to Peter Abelard who was his pupil. Roscelin was born in France, accused twice of heresy but recanted and fled to England where he attacked the views of Anselm, according to whom Roscelin used the phrase that universals were a *flatus voci* or breath of the voice.

The most important nominalist was the Englishman William of Ockham in the 14th cent. who, once and for all, separated the two schools by saying in effect that science is about things (the nominalist view) whereas logic, philosophy, and religion are about terms or concepts (the Platonic tradition).

Nonconformism, the attitude of all those Christian bodies, which do not conform to the doctrines of the Church of England. Up to the passing of the Act of Uniformity in 1662 they were called "puritans" or "dissenters" and were often persecuted. The oldest bodies of nonconformists are the Baptists, Independents, and (in England) the Presbyterians; the Methodists, although dating from 1738, did not consider themselves nonconformists until some time later.

The Presbyterians are the official Church of Scotland where it is the Anglicans (known as "Episcopalians") who are the nonconformists.

O

Objectivism, a philosophy developed by American novelist, Ayn Rand. The briefest summary of Objectivism given by Miss Rand was simply, "*Follow reason*", but that is rather too terse. Objectivism begins with reality as objective, absolute and independent of any mind perceiving it. Consciousness is the faculty of perceiving that which exists, and therefore, existence precedes consciousness. Human conceptual, volitional consciousness (reason) is man's unique means of survival. Ayn Rand upheld reason as the only means to knowledge with logic as its method. Man should live solely by the guidance of his reason.

Ockham's Razor, the philosophical maxim by which William of Ockham, the 14th cent. Franciscan has become best-known. This states in the form which is most familiar: "Entities are not to be multiplied without necessity" and as such does not appear in his works. He did, however, say something much to the same effect: "It is vain to do with more what can be done with fewer." In other words, if everything in some science can be interpreted without assuming this or that hypothetical entity, there is no ground for assuming it.

Optimism. Originally the doctrine propounded by Leibniz (1646–1716) that the actual world is the "best of all possible worlds", being chosen by the Creator out of all the possible worlds which were present in his thoughts as that in which the most good could be obtained at the cost of the least evil. This view was mocked by Voltaire.

Opus Dei. This strictly orthodox Roman Catholic movement was founded in 1928 by a Spanish priest, Monsignor Josemaria Escriva de Balaguer y Albas, and has increasingly found media attention in recent years. It has been heavily criticised for its authoritarian attitudes towards its members and is regarded by some as a church within a church, with a significant amount of Vatican power. Critics view it in almost cultic terms emphasizing accounts of self-mortification, gender separation, youth recruitment and the inability to break ties with the movement. It has also been challenged over its zealous desire to canonize its founder. Its strong membership amongst the clergy as well as the support of Pope John Paul II has given it much credibility, and many regard it as a way to live out their Catholic faith through receiving spiritual support and by understanding better the doctrines of the Church.

It considers itself to be in total agreement with Catholic teachings. Unlike the rest of the Church, it has no official geographical boundaries, and is united through membership. Around a third of members are 'numeraries' who live apart in single gender communities and take vows of celibacy. Although their income does not go directly to Opus Dei, they make serious financial commitments to the work of the Catholic Church. Other 'associates' live celibate lives outside residences, although some members may be married and live within the wider community.

Orangemen, members of a society formed in Ulster back in 1795 to uphold Protestantism. Their name is taken from King William III, Prince of Orange, who defeated James II at the Battle of the Boyne (1690), hence the enormous banners depicting "King Billy on the Boyne" carried in procession on 12 July each year. The old Unionist Party of Northern Ireland (the ruling political party from 1921 to 1972) was largely maintained by the Orange Order.

Original Sin, in Christian doctrine, the corruption that is born with us, as a result of Adam's fall.

Orphism. A mystical religious cult centred around the figure of Orpheus, that flourished in ancient Greece. Orphics believed in transmigration of souls and that the soul after death might obtain either eternal bliss or temporary or permanent torment according to its way of life upon earth.They held ceremonies of purification, and abstained from eating meat, except on special occasions when it was eaten ritually.Orphism influenced Greek society through the mysteries of Eleusis that were initiation rites to Orphism, and which became central to Greek public religion.Orphic beliefs and rites are also found in the work and followers of Pythagoras and Plato.

Orthodox Eastern Church. There are two groups of Eastern churches: (1) those forming the Orthodox Church dealt with here which include the ancient Byzantine patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the national churches of Russia, Greece, Serbia, Bulgaria, Romania, *etc.* (although Orthodox communities exist all over the world and are no longer confined to geographical areas); (2) the churches which rejected Byzantine orthodoxy during various controversies from the 5th to the 7th cent., notably the Coptic church (*q.v.*) and the Armenian church. Although all Orthodox churches share the same doctrine and traditions they are arranged as national independent bodies each with its own hierarchy. They do not recognise the pope, and the primacy of the patriarch of Constantinople is largely an honorary one. Although claiming to be the One Holy, Catholic, and Apostolic Church its alleged infallibility rests on universal agreement rather than on any one individual, and agreement over the faith comes from the Scriptures interpreted in the light of the Tradition.

The latter includes dogmas relating to the Trinity, Christology, Mariology, and Holy Icons; the testimony of the Fathers (St. Athanasius, St. Basil, St. John Chrysostom, St. Cyril of Alexandria, *etc.*); the canons or rules as formulated by the Councils and the Fathers.

The Orthodox Church did not take part in the great Western controversies about the Bible, nor, of course, in the Reformation. But it saw the breakaway of the Old Believers in the 1650s in protest at the reforms of Patriarch Nikon. Attempts have been made to improve relations between Rome and Constantinople: the two Churches agreed in 1935 to retract the excommunications cast on each other in A.D. 1054, which formalised the Great Schism. After the fall of communism in Russia, the Orthodox Church has revived.

In England, the first purpose-built Orthodox Cathedral was constructed in west London. In 1999 Pope John Paul II visited Romania, the first papal visit to a mainly Orthodox country in almost 1,000 years.

In February 2016 the Russian Orthodox Patriarch Kirill met Pope Francis I in Havana, the first encounter of its kind since the split of 1054. Patriarch Kirill also became the first head of the Russian Church to visit Britain.

In 2016, many Orthodox leaders held a highly-significant gathering in Crete. Although boycotted by Russia, it was the first such meeting since 1054.

Oxford Group. *See* **Moral Re-Armament.**

Oxford Movement. *See* **Tractarianism.**

P

Pacifism. The belief that, because violence and the taking of life is morally wrong, war and the employment of organized armed forces cannot be justified. The word first came into use to describe movements advocating the settlement of disputes by peaceful means. Since the First World War the word has been used to describe the refusal of individuals to undertake military service. The first pacificists were minority Christian groups like the Quakers and Plymouth Brethren. In the 20th century the movement broadened and many democratic nations allow their citizens to abstain from fighting on grounds of principle, often described as "conscientious objection".

Paganism, a form of worship which has its roots in the ancient nature religions of Europe. Pagans reverence the sanctity of the Earth, its people and other life forms. Paganism is still a living religion, the main forms of which include Wicca (witchcraft), Druidry, Asatru and Shamanism.

The Pagan Federation was founded in 1971 to provide information and to counter misconceptions about Paganism. There are over 100,000 practising pagans in Britain (mainly Druids) – a number which has doubled in the last decade.

Pan-Africanism, the perception by people of African origins and descent that they have interests in common. The fight against economic exploitation and for equality has been an important theme.

Pantheism. *See* **God and Man.**

Panpsychism. Literally, "all-soul-ism", the view that everything that really exists in the world is a mind or consciousness. To be distinguished from "hylozoism", which claims that everything is alive. Panpsychic views can be found in Leibniz and Schopenhauer, and in the 20th century philosopher A. N. Whitehead (1861–1947).

Papal Infallibility. The basis of papal infallibility is (*a*) that every question of morals and faith is not dealt with in the Bible so it is necessary that there should be a sure court of appeal in case of doubt, and this was provided by Christ when he established the Church as His Teaching Authority upon earth; (*b*) ultimately this idea of the teaching function of the Church shapes the idea of papal infallibility which asserts that the Pope, when speaking officially on matters of faith or morals, is protected by God against the possibility of error. The doctrine was proclaimed in July 1870.

Infallibility is a strictly limited gift which does not mean that the Pope has extraordinary intelligence, that God helps him to find the answer to every conceivable question, or that Catholics have to accept the Pope's views on politics. He can make mistakes or fall into sin, his scientific or historical opinions may be quite wrong, he may write books that are full of errors. Only in two limited spheres is he infallible and in these only when he speaks officially as the supreme teacher and lawgiver of the Church.

Historically speaking, the Roman Catholic Church of the early 19th cent. was at its lowest ebb of power. Pope Pius IX, in fear of Italian nationalism, revealed his reactionary attitude by the feverish declaration of new dogmas, the canonisation of new saints, the denunciation of all modern ideals in the Syllabus of Errors, and the unqualified defence of his temporal power against the threat of Garibaldi. It is not too much to say that everything regarded as important by freedom-loving and democratic people was opposed by the papacy at that time. In 1870, after a long and protracted struggle, the Vatican Council, convened by Pius IX, pronounced the definition of his infallibility. Döllinger, a German priest and famous historian of the Church, was excommunicated because, like many others, he refused to accept the new dogma. There was clearly a connection between the pronouncement of the Pope's infallibility and his simultaneous loss of temporal power.

After the humanism of the Second Vatican Council (1962–5) Pope Paul's encyclical *Hummanae Vitae* (1968), condemning birth control, came as a great disappointment to the many people (including theologians, priests, and laymen) who had expected there would be a change in the Church's teaching. The Church's moral guidance on this controversial issue, however, does not involve the doctrine of infallibility. (The Roman Catholic Church teaches that papal pronouncements are infallible only when they are specifically defined as such.)

This was made clear in July 1973 when the Vatican Sacred Congregation for the Doctrine of the Faith published a document strongly reaffirming papal infallibility. The document also reminded Catholics of their obligation to accept the Catholic Church's unique claims to authenticity.

Parapsychology, the name given to the study of psychical research (*q.v.*) as an academic discipline, and chosen to denote the topic's supposed status as a branch of psychology. The impetus behind parapsychology came from the psychologist William MacDougall who persuaded Duke University in North Carolina, USA, to found a department of parapsychology under J. B. Rhine. Throughout the 1930s and 1940s the work of Rhine and his colleagues, who claimed to have produced scientific evidence for the existence of ESP, attracted world-wide attention. Increasing reservations about the interpretation of Rhine's results and an apparent lack of any readily repeatable experiments gradually eroded scientific confidence in the topic.

Parsees. *See* **Zoroastrianism.**

Pavlovian Theory. *See* **Behaviourism.**

Pelagianism. The Christian doctrine that each person has responsibility for ensuring his own salvation, apart from the assistance of divine grace. Its name is derived from Pelagius, a British lay monk who came to Rome about 400 A.D. and attacked Augustine's view that moral goodness is only possible through divine grace. Pelagius argued that if men and women were not held to be responsible for their actions, there would be nothing to restrain them from sin. His emphasis on free will and the essential goodness of human nature suggested an optimism that was at odds with doctrines of original sin. Augustine attacked Pelagius' views as heretical, a judgement that was confirmed by the church in 417, when Pelagius was excommunicated.

Pentecostalism, a religious movement within some Christian churches, holding the belief that an essential feature of true Christianity is a vigorous and profound spiritual or mystical experience which occurs after, and seemingly reinforces the initial conversion.

The origins of modern Pentecostalism lie in the occasion on 1 January 1901 when a member of a Bible College in Topeka, Kansas, one Agnes N. Ozman, spontaneously began to speak in an apparently unknown language at one of the College's religious meetings. This "speaking in tongues" was assumed to be evidence of her conversion and "spirit baptism", and became a feature of most Pentecostal meetings in due course.

The movement spread very rapidly across America, particularly in rural communities, and also was a strong feature of Welsh religious life in the early part of the century. Pentecostal services are enthusiastic and rousing with a strong emphasis on music and participation on the part of the congregation. The controversial "Toronto Blessing" features in some services. Pentecostalism is evangelistic in nature and is gaining in strength at the present time.

Some leading Pentecostal groups in Britain include the Assemblies of God, the Elim Pentecostal Church and the fast-growing Redeemed Christian Church of God. There are also a rapidly growing number of Black Pentecostal churches.

Peronism, a political movement begun in the late 1940s in Argentina. It followed the teaching of Juan Peron and his wife Eva.

Personality Cult. Political phenomenon whereby a leader, usually the head of state, is elevated above his colleagues to a position where he is seen as responsible for all the nation's or party's achievements but none of its failures. Such elevation is achieved by a massive propaganda exercise including posters and statues of the leader, the naming of towns after him, *etc*. Joseph Stalin (1879–1953) set the pattern as Soviet leader but others have followed, for example Adolf Hitler of Germany, Mao Tse-Tung in China and Kim Il-sung (and his successors) in North Korea. Such cults flourish only in totalitarian régimes.

Pessimism. Philosophically this refers to the doctrine associated with Arthur Schopenhauer (1788–1860), that in this world everything tends to evil, that the amount of pain is greater than the amount of pleasure. Of course, pessimistic ideas have a long history. As the Greeks said: "Call no man happy until he is dead." They are also present in the teachings of eastern and western religions, which emphasize the corruptness of this world and the possibility of happiness only in a hereafter. Schopenhauer's pessimism had a strong influence on Nietzsche, and through him on existentialism (*q.v.*).

Peyotism. A religious movement among North American Indians centred around the *peyote*, a part of the cactus which produces hallucinogenic effects.

Phrenology, a psychological "school" founded in 1800 by two Germans, Franz Josef Gall and Johann Gaspar Spurzheim. Gall was an anatomist who believed there to be some correspondence between mental faculties and the shape of the head.

Phrenology became fashionable, and people would go to "have their bumps read" just as later many men and women have gone to be psychoanalysed. Roughly speaking, Gall divided the mind into thirty-seven faculties such as destructiveness, suavity, self-esteem, conscientiousness, and so on, and claimed that each of these was located in a definite area of the brain. He further claimed that the areas in the brain corresponded to "bumps" on the skull which could be read by the expert, thus giving a complete account of the character of the subject. In fact, (*a*) no such faculties are located in the brain anywhere, for this is simply not the way the brain works; (*b*) the faculties described by Gall are not pure traits which cannot be further analysed and are based on a long outdated psychology; (*c*) the shape of the brain bears no specific relationship to the shape of the skull.

Phrenology is a pseudo-science; there is no truth in it whatever. But, even so, like astrology, it still has its practitioners.

Physiocrats. A French school of economic thought during the 18th cent., known at the time as *Les Economistes* but in later years named physiocrats by Du Pont de Nemours, a member of the School. Other members were Quesnay, Mirabeau, and the great financier Turgot. The physiocrats held the view, common to the 18th cent., and deriving ultimately from Rousseau, of the goodness and bounty of nature and the goodness of man "as he came from the bosom of nature". The aim of governments, therefore, should be to conform to nature; and so long as men do not interfere with each other's liberty and do not combine among themselves, governments should leave them free to find their own salvation. Criminals, madmen, and monopolists should be eliminated. Otherwise the duty of government is *laissez-faire, laissez passer*.

From this follows the doctrine of free trade between nations on grounds of both justice and economy; for the greater the competition the more will each one strive to economise the cost of his labour to the general advantage. Adam Smith, although not sharing their confidence in human nature, learned much from the physiocrats, eliminated their errors, and greatly developed their teaching.

Physiognomy. *See* **Characterology.**

Pietism, a movement in the Lutheran Church at the end of the 17th cent.—the reaction, after the sufferings of the thirty years' war, of a pious and humiliated people against learning, pomp and ceremony, and stressing the importance of man's personal relationship with God. The writings of Johann Georg Hamann (1730–88) who came from a Pietist family of Königsberg influenced Kierkegaard. The Pietist movement was one root of the great Romantic movement of the 18th century.

Platonism. Philosophical ideas that are inspired by the writings of Plato, usually embracing his belief in a realm of unchanging and eternal realities (specifically, abstract entities or universals) independent of the world perceived by the senses. Most working mathematicians are Platonists, in the sense that they believe that mathematical objects like numbers exist independently of our thought and hence that mathematical statements are true or false independently of our knowledge of them.

Pluralism. (1). In philosophy, any metaphysical view that the world must consist of more than one or two basic kinds of entity; these latter views would be called Monism or Dualism. Pluralists, such as William James, think of themselves as empiricists, reaffirming plain facts of experience against metaphysical extremists and pointing to the irreducible variety of things.

(2). In political thought, it refers to the autonomy enjoyed by disparate groups or institutions within a society and also to the belief that such an arrangement for the distribution of political power should exist. As such it provides an alternative to collectivist doctrines, which may coerce the individual, and individualistic doctrines, which fail to provide an understanding of the individual's role in society. Pluralism is widely regarded as an ideal, but there is much argument as to how pluralism is to be interpreted in detail and how it is to be applied effectively within a modern society.

Plymouth Brethren, a religious sect founded by John Nelson Darby, a minister of the Protestant Church of Ireland, and Edward Cronin a former Roman Catholic, in 1827. Both were dissatisfied with the lack of spirituality in their own and other churches and joined together in small meetings in Dublin every Sunday for "the breaking of bread". Soon the movement began to spread through Darby's travels and writings and he finally settled in Plymouth, giving the popular name to the "Brethren". Beginning as a movement open to all who felt the need to "keep the unity of the Spirit", it soon began to exclude all who had unorthodox views and split up into smaller groups.

Among these were the "Exclusives", the Kellyites, the Newtonites, and "Bethesda" whose main differences were over problems of church government or prophetical powers.

Today, the majority of Brethren belong to the "Open Brethren" assemblies and, unlike the "Exclusives" hold that the Lord's Supper (a commemorative act of "breaking the bread" observed once a week) is for all Christians who care to join them. Baptism is required and Brethren believe in the personal premillennial second coming of Christ.

Poltergeist, allegedly a noisy type of spirit which specialises in throwing things about, making loud thumpings and bangings, and occasionally bringing in "apports", *i.e.*, objects from elsewhere. Most so-called poltergeist activities are plain frauds, but the others are almost invariably associated with the presence in the house of someone (often, but not always a child) who is suffering from an adolescent malaise or an epileptic condition. The inference is that those activities which are not simply fraudulent are either due to some unknown influence exuded by such mentally disturbed people, or that they are actually carried out by ordinary physical means by such people when in an hysterical state—*i.e.*, unconsciously. The second hypothesis is much the more probable. *See* **Psychic Research.**

Polygamy, the ancient custom whereby a man took more than one wife. Most polygamy today is to be found in some parts of the Islamic world, sub-Saharan Africa and Burma.

Polytheism. *See* **God and Man.**

Populism. A form of politics which emphasizes the virtues of the common people against politicians and intellectuals, who are distrusted as devious and selfish. "The will of the people" can provide sufficient guidance to the statesman. It is not restricted to any one political view and can manifest itself in left, right or centrist forms. It has become a feature of present-day politics (*e.g.* Donald Trump in America, UKIP in Britain and other protest movements in Europe).

Positivism, also known as the **Religion of Humanity,** was founded by Auguste Comte (1798–1857), a famous mathematician and philosopher born in Montpellier, France. His views up to the end of the century attracted many and it would have been impossible throughout that time to read a book on philosophy or sociology that did not mention them, but today his significance is purely of historical interest. In his *Cours de Philosophie Positive* (1830) he put forward the thesis that mankind had seen three great stages in human thought: (1) the theological, during which man seeks for supernatural causes to explain nature and invents gods and devils; (2) the metaphysical, through which he thinks in terms of philosophical and metaphysical abstractions; (3) the last positive or scientific stage when he will proceed by experimental and objective observation to reach "positive truth".

Broadly speaking, there is little to complain of in this analysis; for there does seem to have been some sort of general direction along these lines. However, Comte was not satisfied with having reached this point and felt that his system demanded a religion and, of course, one that was "scientific". This religion was to be the worship of Humanity in place of the personal Deity of earlier times, and for it he supplied not only a Positive Catechism but a treatise on

Sociology in which he declared himself the High Priest of the cult. Since, as it stood, the religion was likely to appear somewhat abstract to many, Comte drew up a list of historical characters whom he regarded as worthy of the same sort of adoration as Catholics accord to their saints.

The new Church attracted few members, even among those who had a high regard for Comte's scientific work, and its only significant adherents were a small group of Oxford scholars and some in his own country. Frederic Harrison was the best-known English adherent and throughout his life continued to preach Comtist doctrines in London to diminishing audiences.

Post-Colonialism has developed as a literary and academic examination of identity and culture in the wake of colonial rule. Post-colonial history has sought to give voice to the peoples colonized, and their experience of its legacy. Academic history has been followed by literature, where authors such as Derek Walcott and Salman Rushdie have studied the history and effect of colonization. The emphasis on the complex inheritance of colonization on culture has led to a wider view of post-colonialism, where the foundations of individual identity and experience are examined as constructions of multiple and not necessarily compatible traditions.

Post-colonialism studies the how colonial powers exploit not only the natural but cultural resources of their colonies, leaving the language, institutions, and identity greatly transformed. This continued inheritance of effect is interrogated to reveal the subtle contours of oppression, and authors such as Edward Said and Homi Bahbha attempt to unpick this entanglement to liberate distinctive ways of thinking and acting from the colonizers' effect.

Postmodernism. Given that "modernism" (*q.v.*) is a term difficult to define, "postmodernism" is an even more elusive concept, though a very fashionable one for describing contemporary art. The modernist tradition of formal and stylistic experiment, added to our increased knowledge of the history of Western and non-Western arts, has provided a vast range of styles, techniques and technologies for the artist to choose from. This extension of choice has simultaneously created uncertainty about their use. If no one or few styles have any authority, then the artist picks and chooses with little commitment, and so tends towards pastiche, parody, quotation, self-reference and eclecticism. The post-modern style is to have no settled style. But it is always dangerous to try and pin down an artistic movement that is still taking place.

Pragmatism, a typically American school of philosophy which comes under the heading of what Bertrand Russell described as a "practical" as opposed to a "theoretical" philosophy. Whereas the latter, to which most of the great philosophical systems belong, seeks disinterested knowledge for its own sake, the former (*a*) regards action as the supreme good, (*b*) considers happiness an effect and knowledge a mere instrument of successful activity.

The originator of pragmatism is usually considered to have been the psychologist William James (1842–1910) although he himself attributed its basic principles to his life-long friend, the American philosopher, Charles Sanders Peirce (1839 1914). The other famous pragmatist was John Dewey, best-known in Europe for his works on education.

James in his book *The Will to Believe* (1896) pointed out that we are often compelled to take a decision where no adequate theoretical grounds for a decision exist; for even to do nothing is to decide. Thus in religion we have a right to adopt a believing attitude although not intellectually fully convinced. We should believe truth and shun error, but the failing of the sceptical philosopher is that he adheres only to the latter rule and thus fails to believe various truths which a less cautious man will accept. If believing truth and avoiding error are equally important, then it is a good idea when we are presented with an alternative to believe one of the possibilities at will, since we then have an even chance of being right, whereas we have none if we suspend judgment. The function of philosophy, according to James, is to find out what difference it makes to the individual if a particular philosophy or world-system is true: "An idea is "true' so long as to believe it is profitable to our lives" and, he adds, the truth is only the expedient in our way of thinking . . . in the long run and on the whole of course". Thus "if the hypothesis of God works satisfactorily in the widest sense of the word, it is true".

Bertrand Russell's reply to this assertion is: "I have always found that the hypothesis of Santa Claus "works satisfactorily in the widest sense of the word'; therefore "Santa Claus exists' is true, although Santa Claus does not exist."

Russell adds that James's concept of truth simply omits the question whether God really *is* in His heaven; if He is a useful hypothesis that is enough. "God the Architect of the Cosmos is forgotten; all that is remembered is belief in God, and its effects upon the creatures inhabiting our petty planet. No wonder the Pope condemned the pragmatic defence of religion."

Predestination. *See* **Calvinism.**

Presbyterianism, a system of ecclesiastical government of the Protestant churches which look back to John Calvin as their Reformation leader. The ministry consists of presbyters who are all of equal rank. Its doctrinal standards are contained in the *Westminster Confession of Faith* (1647) which is, in general, accepted by English, Scottish, and American Presbyterians as the most thorough and logical statement in existence of the Calvinist creed. The Church of Scotland is the leading Presbyterian church in the British Isles.

The Reformation in Scotland was preceded by the same sort of awareness of the moral corruption of the Roman Church as had happened elsewhere, but for a variety of political and emotional reasons the majority of the Scottish people (unlike the English who had been satisfied with the mere exchange of Crown for Pope) were determined on a fundamental change of doctrine, discipline, and worship, rather than a reform of manners.

John Knox. The Scottish preachers had learned Protestantism not from Luther but from Calvin and their leader John Knox had worked in Geneva with Calvin and was resolved to introduce the system into Scotland. In 1557 the "Lords of the Congregation" signed the Common Band (*i.e.*, a bond or covenant) to maintain "the blessed Word of God and his congregation" against their enemies, and demanded the right to worship as they had chosen. However, the real date of the Scottish Reforma- tion is August 1560 when Mary of Guise (the regent for Mary Queen of Scots who was not yet of age) died and the Estates met to settle their affairs without foreign pressure; the *Scots Confession* was drawn up and signed by Knox and adopted by the Estates.

The ideas on which the Reformed Kirk was based are found in the *Scots Confession*, the *Book of Discipline*, and the *Book of Common Order*, the so-called Knox's liturgy. Knox's liturgy, the same as that used in Geneva but translated into English, was used until Laud's attempt to force an Anglican liturgy on the Kirk led to an abandonment of both in favour of "free prayers."

The Presbyterian Tradition. This includes uncompromising stress on the Word of God contained in the Scriptures of the Old and New Testaments as the supreme rule of faith and life, and on the value of a highly trained ministry, which has given the Church of Scotland, a high reputation for scholarship and has in turn influenced the standard of education in Scotland. The unity of the Church is guaranteed by providing for democratic representation in a hierarchy of courts (unlike the Anglican Church, which is a hierarchy of persons). The local kirk-session consists of the minister and popularly elected elders (laymen). Ministers, elected by their flocks, are ordained by presbyters (ministers already ordained). Above the kirk-session is the court of the presbytery which has jurisdiction over a specified area; above that the court of synod which rules over many presbyteries; and finally the General Assembly which is the Supreme Court of the Church with both judicial and legislative powers, and over which the Moderator of the General Assembly presides. The function of the elders is to help the minister in the work and government of the kirk.

The episcopacy set up by James VI and I, and maintained by Charles I was brought to an end by the Glasgow Assembly (1638), but General Assemblies were abolished by Oliver Cromwell and at the Restoration Charles II re-established episcopacy. The Covenanters who resisted were hunted down, imprisoned, transported, or executed over a period of nearly thirty years before William of Orange came to the throne and Presbyterianism was re-established (1690).

In 1972 the Presbyterian and Congregationalist Churches in England were merged to form the United Reformed Church. *See* **Church of Scotland, Calvinism.**

Protestant, the name first applied to those who favoured the cause of Martin Luther and who protested against the intolerant decisions of the Catholic majority at the second Diet of Speyer (1529), revoking earlier decisions of the first Diet of Speyer tolerating the Reformers in certain cases (1526).

In general the name "Protestant" is applied to those Churches which severed connection with Rome at the time of the Reformation. The essence of Protestantism is the acceptance by the individual Christian of his direct responsibility to God rather than to the Church. *See also* **Lutheranism, Presbyterianism, Calvinism.**

Psychiatry, a branch of medicine concerned with the treatment of psychological problems and mental illness. It uses drugs and psychotherapeutic techniques.

Psychic Research is a general term for the various approaches to the scientific investigation of the paranormal, in particular supposed extra-sensory powers of the mind, but also manifestations such as ghosts, poltergeists, spiritualistic phenomena, *etc.*

In recent years the word parapsychology has also come into use, particularly for the investigation of ESP (extra-sensory perception) in a laboratory setting.

Psychoanalysis, an approach to the study of human personality involving the rigorous probing, with the assistance of a specially trained practitioner, of an individual's personal problems, motives, goals and attitudes to life in general. Often, and quite understandably, confused with psychology (of which it is merely a part), psychoanalysis has an interesting historical background and has attracted the interest of philosophers, scientists and medical experts since it emerged as a radical and controversial form of mental therapy at the turn of the century. The traditionally accepted founder is the great Austrian Sigmund Freud, but he never failed to acknowledge the impetus that had been given to his own ideas by his talented friend, the physiologist Joseph Breuer, who for most of his working life had been interested in the curious phenomena associated with hypnosis. Breuer had successfully cured the hysterical paralysis of a young woman patient and had noticed that under hypnosis the girl seemed to be recalling emotional experiences, hitherto forgotten, which bore some relationship to the symptoms of her illness.

Developing this with other patients Breuer then found that the mere recalling and discussing of the emotional events under hypnosis seemed to produce a dramatic alleviation of the symptoms—a phenomenon which came to be known as *catharsis*. Breuer also noticed another curious side-effect, that his women patients fell embarrassingly and violently in love with him, and he gradually dropped the practice of "mental catharsis", possibly feeling that it was a bit too dangerous to handle. This left the field clear for Freud, whose brilliant mind began to search beyond the therapeutic aspects of the topic to see what light might be thrown on the nature of human personality and psychological mechanisms in general. The most important question concerned the "forgotten" emotional material which turned up, apparently out of the blue, during the hypnotic session. Freud rightly saw that this posed problems for the current theories of memory, for how could something once forgotten (*a*) continue to have an effect on the individual without his being aware of it, and (b) ultimately be brought back to conscious memory again. It must be remembered that at this time memory was considered to be a fairly simple process—information was stored in the brain and was gradually eroded or destroyed with the passage of time and the decay of brain cells.

Once lost, it was believed, memories were gone for ever, or at best only partially and inaccurately reproducible. Furthermore, human beings were supposed to be rational (if frequently wilful) creatures who never did anything without thinking about it (if only briefly) beforehand and without being well aware of their reasons for so doing.

The Genius of Freud. It was within this framework that Sigmund Freud had his great insight, one which many people believe to be one of the most important ideas given to mankind. This was simply the realisation that the human mind was not a simple entity controlling the brain and body more or less at will, but a complex system made up of a number of integrated parts with at least two major subdivisions—the conscious and the unconscious. The former concerned itself with the normal round of human behaviour, including the larger part of rational thought, conversation, *etc.*, and large areas of memory. The latter was principally devoted to the automatic control of bodily functions, such as respiration, cardiac activity, various types of emotional behaviour not subject to much conscious modification and a large storehouse of relevant "memories" again not normally accessible to the conscious mind. Occasionally, Freud proposed, an exceedingly unpleasant emotional or otherwise painful event might be so troublesome if held in the conscious mind's store, that it would get shoved down into the unconscious or "repressed" where it would cease to trouble the individual in his normal life. The advantages of this mechanism are obvious, but they also brought with them hazards. With certain kinds of memory, particularly those involving psychological rather than physical pain—as for example a severe sexual conflict or marital problem—repression might be used as a device to save the individual from facing his problem in the "real" world, where he might be able ultimately to solve it, by merely hiding it away in the unconscious and thus pretending it did not exist. Unfortunately, Freud believed, conflicts of this kind were not snuffed out when consigned to the basements of the mind, but rather tended to smoulder on, affecting the individual in various ways which he could not understand. Repressed marital conflicts might give rise to impotence, for example, or perhaps to homosexual behaviour. Guilt at improper social actions similarly repressed might provoke nervous tics, local paralysis, *etc, etc.* Following this line of reasoning, Freud argued that if the unwisely repressed material could be dredged up and the individual forced to face the crisis and not deny it, then rapid alleviations of symptoms and full recovery should follow.

The Achievement of Freud. To the great psychologist and his growing band of followers the stage seemed to be set for a dramatic breakthrough not only in mental therapy but also in a general understanding of the nature of human personality. To his pleasure—for various reasons he was never too happy about hypnosis—Freud discovered that with due patience, skill and guidance an individual could be led to resurrect the material repressed in his unconscious mind in the normal, as opposed to the hypnotic, state. This technique, involving long sessions consisting of intimate discussions between patient and therapist became known as psychoanalysis, and it has steadily evolved from its experimental beginnings in the medical schools and universities of Vienna to being a major system of psychotherapy with a world-wide following and important theoretical connotations. Psychoanalysis, as practised today, consists of a number of meetings between doctor and patient in which the latter is slowly taught to approach and enter the *territory* of his subconscious mind, and examine the strange and "forgotten" material within. A successful analysis, it is claimed, gives the individual greater insight into his own personality and a fuller understanding of the potent unconscious forces which are at work within him.

Freud's initial ideas were of course tentative, and meant to be so. He was however a didactic and forceful personality himself, unwilling to compromise on many points which became controversial as the technique and practice of psychoanalysis developed. The outcome was that some of his early followers, notably the equally brilliant Carl Jung and Alfred Adler, broke away to found their own "schools" or versions of psychoanalysis. Jungian analysis, practised by the followers of C. G. Jung is an important aspect of psycho-analysis.

All psychoanalysts, Freudian and Jungian, must have a lengthy training analysis by a training analyst from a recognised institute. This is not restricted to individuals qualified in medicine or psychology. Today, psychoanalysis is coming under increasing scrutiny, and its claims are being treated with a good deal of reservation. Notable antagonists include the English psychologist Professor H. J. Eysenck. Analysts respond by saying that their system is closer to an art than a craft and not amenable to routine scientific experiment.

The controversy will no doubt continue for some time to come, but whatever its validity as therapy, the basic ideas behind psycho-analysis—notably the reality and power of the unconscious mind—are beyond question and have given human beings definite and major insights into the greatest enigma of all—the workings of the human mind.

Psychology is the study of people: how they think, how they act, react and interact. Psychology is concerned with all aspects of behaviour and the thoughts, feelings and motivation underlying such behaviour. Modern psychology is thus the science of human behaviour and experience. *See* **Adlerian Psychology, Biopsychology, Evolutionary Psychology, Gestalt Psychology** *etc*.

Psychotherapy, a method aimed at alleviating mental and emotional suffering through a specialised relationship between therapist and patient. The whole range of psychotherapies is represented on the National Register, which is compiled by the UK Council for Psychotherapy. This incorporates eight different models, each one of which holds in common a theory about the human mind, a concept of the development of the individual, and a theory of change.

Purim is the celebration of the saving of the Jewish community of Persia, as retold in the Book of Esther, known as the Megillah. It is a day of great feasting and rejoicing, but has its focal point in the reading of a scroll of Esther in the synagogue, once in the morning and once in the evening. It is a time for the whole Jewish community to come together, but women have a special place on account of Esther's courageous acts.

Puritans were a separate sect before the accession of Edward VI, but did not become prominent till the reign of Elizabeth. Afterwards they split up into Independents and Presbyterians, and the influence of Oliver Cromwell made the former supreme. Since the Revolution the word has been replaced by "Nonconformist' or "Dissenter', but, of course, Roman Catholics in England and Protestant Episcopalians in Scotland are just as much Nonconformists or Dissenters as Baptists or Methodists.

Pyramidology, a curious belief that the dimensions of the Great Pyramid at Giza, if studied carefully, reveal principles of fundamental historical and religious significance. The perpetrator of this was a Victorian publisher, John Taylor, who discovered that if you divide the height of the pyramid into twice the side of its base you get a number very similar to *pi*—a number of considerable mathematical importance. Later discoveries in the same vein include the finding that the base of the pyramid (when divided by the width of a single casing stone) equals exactly 365—number of days in the year. Many books have been written on the interpretation of the dimensions of the pyramid, none of which has any scientific or archaeological validity. Pyramidology is simply a classic example of the well-known fact that hunting through even a random array of numbers will turn up sequences which appear to be "significant"—always provided that one carefully selects the numbers one wants and rejects those that one doesn't!

Pyrrhonism, a sceptical philosophy which doubts everything. (*See* **Scepticism**)

Pythagoreanism. The school of thought initiated by the followers of Pythagoras. It is to be distinguished from Pythagoras himself, whose own doctrines are difficult to determine. The Pythagoreans believed that at its deepest level, reality is mathematical in nature, that is, all things can be ultimately reduced to numerical relationships. Their theory of number was applied to music theory, acoustics, geometry and astronomy. The doctrine of the "harmony of the spheres" seems to have started with them: certain parameters characterizing the planets are related to one another "harmoniously" by a mathematical rule. The revolution of each planet produces a distinct tone, and the whole set corresponds to the notes of a scale.

They also held a doctrine of metempsychosis: the soul transmigrates through successive reincarnations to union with the divine.

Q

Quakers, (**Religious Society of Friends**), a religious body founded in England in the 17th cent. by George Fox (1624-91). The essence of their faith is that every individual person has the power of direct communication with God who will guide him into the ways of truth. This power comes from the "inner light" of his own heart, the light of Christ, Quakers meet for worship avoiding all ritual, without ordained ministers or prepared sermons; often there is silence until someone is moved by the Holy Spirit to utter his message.

In the early days Quakers gave vent to violent outbursts and disturbed church services. Friends had the habit of preaching at anyone who happened to be nearby, their denunciation of "steeple-houses" and references to the "inner light," their addressing everyone as "thee" and "thou," their refusal to go beyond "yea" and "nay" in making an assertion and refusing to go further in taking an oath, must have played some part in bringing about the savage persecutions they were forced to endure.

Many emigrated to Pennsylvania, founded by William Penn in 1682, and missionaries were sent to many parts of the world. The former violence gave way to gentleness. Friends not only refused to take part in war but even refused to resist personal violence. They took the lead in abolishing slavery, worked for prison reform and better education.

Many Quakers are quiet, sincere, undemonstrative people, sometimes given to a somewhat serious turn of mind. The former peculiarities of custom and dress have been dropped and interpretation of the Scriptures is more liberal.

Quakers refuse to take part in warfare, but they are always ready to help the victims of war. Quakers have also played a major part in the struggle for human rights—campaigning against slavery and for equality for women. In 2009 they became Britain's first church to allow marriage between gay couples.

Quietism, a doctrine of extreme asceticism and contemplative devotion, embodied in the works of Michael Molinos, a 17th cent. Spanish priest, and condemned by Rome. It taught that the chief duty of man is to be occupied in the continual contemplation of God, so as to become totally independent of outward circumstances and the influence of the senses. Quietists taught that when this stage of perfection is reached the soul has no further need for prayer and other external devotional practices.

Similar doctrines have been taught in the Muslim and Hindu religions. *See* **Yoga**.

Qigong, ancient Chinese belief that the energy of the body can be channeled using breathing, massage and meditation techniques.

Quran (**Koran**). *See* **Islam**.

R

Racism, the doctrine that one race is inherently superior or inferior to others, one of the bases of racial prejudice. It has no connection whatever with the study of race as a concept, nor with the investigation of racial differences.

Radiesthesia, the detection, either by some "psychic" faculty or with special equipment, of radiations alleged to be given off by all living things and natural substances such as water, oil, metal, *etc.* The word radiesthesia is in fact a fancy modern name for the ancient practice of "dowsing," whereby an individual is supposed to be able to detect the presence of hidden underground water by following the movements of a hazel twig held in his hands. Dowsers, or water diviners, as they are sometimes called, claim also to be able to detect the presence of minerals and, hard though it may seem to believe, have actually been hired by major oil companies to prospect for desert wells—though without any notable success. Dowsers are still employed today to locate water for farms or to locate underground pipes and cables. Science rejects their claims

Ramadan. The ninth month of the Islamic calendar during which the Prophet received his first revelations from God. Mohammed had traditionally spent this month fasting and praying, but now it is a compulsory duty for Muslims to fast between the hours of sunrise and sunset, known as *Sawm*. This fast extends to food, drink, cigarettes, chewing gum and sexual relations. Its purpose is to concentrate the heart on God without distraction and to develop self-control. It is traditionally broken each day with *iftar*, some dates and water, following the Prophet's example. A later meal will then follow. Whilst it is a duty, certain groups will be excused including the aged and those under twelve years of age. Pregnant or nursing mothers as well as travellers are temporarily excused with the understanding that fast days will be made up at a later date.

Following the lunar calendar, Ramadan moves forward ten or eleven days each year. As such, *Sawm* can be a very testing experience during the height of summer.

Ranters, a fanatical antinomian (holding the doctrine that Christians are not bound to keep the law of God) and pantheistic sect in Commonwealth England. The name was also applied to the Primitive Methodists because of their noisy preaching.

Rastafari (**Rastafarianism**), a Caribbean religious movement which took root in Jamaica in the 1930s following the teachings of Marcus Garvey who set up the "Black Star Liner" for the repatriation of Africans abroad. Rastafari look to Ethiopia as their spiritual home since that country was the one part of Africa not to be colonised permanently (it was invaded by Mussolini in the 1930s). Reggae is their music. Many Rastafari smoke marijuana as a spiritual act. Coffee, milk and alcohol are usually avoided.

Rationalism is defined as "the treating of reason as the ultimate authority in religion and the rejection of doctrines not consonant with reason." In practice, rationalism had a double significance: (1) the doctrine as defined above, and (2) a 19th cent. movement which was given to what was then known as "free-thought," "secularism," or agnosticism—*i.e.*, it was in the positive sense anti-religious and was represented by various bodies such as the Secular Society, the National Secular Society, and the Rationalist Press Association (founded in 1899).

The great rationalists of the 17th century were Descartes, Spinoza and Leibniz.

Realism is a word which has so many meanings, and such contradictory ones, in various spheres, that it is difficult to define. We shall limit ourselves to its significance in philosophy. In philosophy, "realism" has two different meanings, diametrically opposed. (1) The most usual meaning is the one we should least expect from the everyday sense of the word—*i.e.*, it refers to all those philosophies from Plato onwards which maintained that the world of appearance is illusory and that ideas, forms, or universals are the only true realities, belonging to the world beyond matter and appearance—the world of God or mind. In early mediaeval times St. Thomas Aquinas was the chief exponent of this doctrine which was held by the scholastics as opposed to the Nominalists (*q.v.*). (2) In its modern everyday meaning "realism" is the belief that the universe is real and not a creation of mind, that there is a reality that causes the appearance, the "thing-in-itself" as Kant described it. Material things may not really be what they appear to be (*e.g.* a noise is not the "bang" we experience but a series of shock-waves passing through the atmosphere), yet, for all that, we can be sure that matter exists and it is very possible (some might add) that mind does not.

Reformation, the great religious movement of the 16th cent., which resulted in the establishment of Protestantism. John Wyclif (d. 1384), John Hus (d. 1415) and others had sounded the warning note, and when later on Luther took up the cause in Germany, and Zwingli in Switzerland, adherents soon became numerous. The wholesale vending of indulgences by the papal agents had incensed the people, and when Luther denounced these things he spoke to willing ears. After much controversy, the reformers boldly propounded the principles of the new doctrine, and the struggle for religious supremacy grew bitter. They claimed justification (salvation) by faith, and the use as well as the authority of the Scriptures, rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints, and the headship of the Pope. Luther was excommunicated. But the Reformation principles spread and ultimately a great part of Germany, as well as Switzerland, the Low Countries, Scandinavia, England, and Scotland were won over to the new faith.

In England Henry VIII readily espoused the Reformation, his own personal quarrel with the Pope acting as an incentive. Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated. *See* **Lutheranism, Calvinism, Presbyterianism, Baptists,** *etc.*

Reiki, a form of spiritual healing which originated in Japan.

Relativism. Theories or doctrines that truth, morality *etc.* are relative to situations and are not absolute. The view that all truth is relative is associated with Scepticism (*q.v.*). In the area of morality, it is the view that there are no absolute or universal criteria for ethical judgements. This view is often a reaction to the differences in moral belief between different societies. It is objected against relativism that there must be standards by which to measure the correctness of judgements or beliefs.

Religious Society of Friends. *See* **Quakers.**

Renaissance, the revival of art and letters, under the influence of classical models, which began in Italy in the 14th century. It is a term which must be used with care for the following reasons: (1) Although it was first used in the form *rinascita* (re-birth) by Vasari in 1550 and people living at that time certainly were aware that something new was happening, the word had no wide currency until used by the Swiss historian Jacob Burchardt in his classic *The Civilization of the Renaissance in Italy* (1860). (2) The term as used today refers not only to art in its widest sense but to a total change in man's outlook on life which extended into philosophical, scientific, economic, and technical fields. (3) Spreading from Italy there were renaissance movements in France, Spain, Germany, and northern Europe, all widely different with varying delays in time.

The real cause of the Renaissance was not the fall of Constantinople, the invention of printing, or the discovery of America, though these were phases in the process; it was, quite simply, money. The birth of a new merchant class gave rise to individualist attitudes in economic affairs which prepared the way for individualism and humanism. The new wealthy class in time became patrons of the arts whereas previously the Church had been the major patron and controller. Thus the artist became more free to express himself, more respected, and being more well-to-do could afford to ignore the Church and even, in time, the views of his patrons.

It is true that art continued to serve to a considerable extent the purposes of faith, but it was judged from the standpoint of art. Medieval art was meant to elevate and teach man: Renaissance art to delight his senses and enrich his life. From this free and questing spirit acquired from economic individualism came the rise of modern science and technology; here Italy learned much from the Arab scholars who had translated and commented upon the philosophical, medical, and mathematical texts of antiquity, while denying themselves any interest in Greek art and literature. Arabic

Latin versions of Aristotle were in use well into the 16th cent. The Byzantine culture, though it had preserved the Greek tradition and gave supremacy to Plato, had made no move forward. But the Greek scholars who fled to Italy after the fall of Constantinople brought with them an immense cargo of classical manuscripts. The recovery of these Greek masterpieces, their translation into the vernaculars, and the invention of printing, made possible a fuller understanding of the Greek spirit.

It was the bringing together of the two heritages, Greek science, and Greek literature, that gave birth to a new vision. But it was not only Aristotle and Plato who were being studied but Ovid, Catullus, Horace, Pliny and Lucretius. What interested Renaissance man was the humanism of the Latin writers, their attitude to science, their scepticism.

Early Renaissance. The period *c.* 1400–1500 is known as the Early Renaissance. During this time such painters as Masaccio, Uccello, Piero della Francesca, Botticelli, and Giovanni Bellini were laying the foundations of drawing and painting for all subsequent periods including our own. They concerned themselves with such problems as anatomy, composition, perspective, and representation of space, creating in effect a grammar or textbook of visual expression.

High Renaissance. The term High Renaissance is reserved for a very brief period when a pure, balanced, classical harmony was achieved and artists were in complete control of the techniques learned earlier. The High Renaissance lasted only from *c.* 1500 to 1527 (the date of the sack of Rome), yet that interval included the earlier works of Michelangelo, most of Leonardo's, and all the Roman works of Raphael.

Ritualism, a tendency which, during the 19th cent., developed in the High Church section of the Church of England to make use of those vestments, candles, incense, *etc.* which are usually regarded as features of the Church of Rome. Since some opposition was aroused, a Ritual Commission was appointed in 1904 to take evidence and try to find some common basis on which High and Low Church could agree with respect to ceremonial. The report of 1906 in effect recommended the giving of greater powers to bishops to suppress objectionable practices.

Although they are often associated together, it is worth while pointing out that there was no special connection between the Oxford Movement or Tractarians (*q.v.*) and Ritualism because Pusey disliked ritual and even Newman, who eventually went over to Rome, held simple services at his church of St. Mary's.

Roman Catholic Church, the Christian organisation which acknowledges the Pope as the lawful successor of St. Peter, the apostle appointed by Christ to be the head of His Church. The reforming impulse at the Second Vatican Council (1962–5), summoned by Pope John, set in train movements towards religious unity and the reform and modernisation of the Church. Pope Paul made changes in the government and liturgy of the Church but refused to allow birth control, the marriage of priests or a greater role for women.

A historic meeting took place in 1982 between Rome and Canterbury when Pope John Paul II made the first papal visit to Britain. The 1993 papal encyclical, *Veritatis Splendor*, forcefully restating the Catholic opposition to artificial birth control, reopened Catholic divisions on this issue. The English text of the Catechism of the Catholic Church, the first complete survey of Roman Catholic teaching since the 16th century, was published in 1994.

In 1995 the Pope's encyclical *Evangelium Vitae* (Gospel of Life) repeated his attacks on abortion, euthanasia, suicide and *in vitro* fertilisation. Many liberal Roman Catholics were unhappy with the more conservative pronouncements of the Pope. During his pontificate, Pope John Paul canonised more saints than any Pope in history.

Some Anglicans (opposed to women priests) have moved to join the Catholic Church. The resignation in September 1996 of the Bishop of Argyll reinforced the growing debate on celibacy in the priesthood (the celibacy rule dates from 1139). In March 2000 the Pope sought a historic pardon for the sins of the Church (the *mea culpa*).

With the death of Pope John Paul II in April 2005 the Roman Catholic Church entered a new era. Over recent years, weekly attendance at Sunday Mass in England declined from 1·7 million in 1989 to 1,000,000 today. Entrants to the priesthood are also declining. The number of Roman Catholic priests in the world is around 400,000. The Church has also been severely damaged by revelations of extensive child sexual abuse.

The most important Catholic countries (by numbers) are Brazil (*c.* 123 million), Mexico (94 million), the Philippines (66 million) and the USA (also 66 million). The Basilica of Our Lady of Peace in Yamoussoukro, Ivory Coast, is the world's largest church. There are currently more Muslims in the world than Catholics.

In 2013 Roman Catholics were shocked by the resignation of Pope Benedict XVI-the first in modern times. He was succeeded by Pope Francis I who has emphasised poverty and green issues. In February 2016 Pope Francis met Russian Orthodox Patriarch Kirill in Cuba, the first such meeting since the 1054 split. Also in 2016, the Pope established a commission to consider the ordination of women deacons.

Romantic Movement or **Romanticism** is the name given not so much to an individual way of thinking but to the gradual but radical transformation of basic human values that occurred in the Western world round about the latter part of the 18th cent. It was a great breakthrough in European consciousness and arose through the writings of certain men living during the half-century or more following, say, 1760. It arose when there was a revolution in basic values—in art, morals, politics, religion, *etc.* The new view was of a world transcending the old one, infinitely larger and more varied.

To understand the Romantic movement it is necessary first to take note of the climate of thought preceding the great change; then to account for its beginning in Germany where it did (*see* **Pietism**) during the latter part of the 18th cent., and finally to appraise the writings of those men whose ideas fermented the new awakening. Briefly, the shift was away from French classicism and from belief in the all-pervasive power of human reason (the Enlightenment) towards the unfettered freedom that the new consciousness was able to engender. What mattered was to live a passionate and vigorous life, to dedicate oneself to an ideal, no matter what the cost (*e.g.*, Byron).

The ideas of the Enlightenment (*e.g.*, Fontenelle, Voltaire, Montesquieu) had been attacked by the Germans Hamann and Herder and by the ideas of the English philosopher Hume, but Kant, Schiller, and Fichte, Goethe's novel *Wilhelm Meister*, and the French Revolution all had profound effects on the aesthetic, moral, social, and political thought of the time. Friedrich Schlegel (1772–1829) said: "There is in man a terrible unsatisfied desire to soar into infinity; a feverish longing to break through the narrow bonds of individuality." Romanticism undermined the notion that in matters of value there are objective criteria which operate between men. Henceforth there was to be a resurgence of the human spirit, deep and profound, that is still going on.

Rosicrucians, a mystical society founded in the 16th cent. by Christian Rosenkreuz which attempted to forge a theoretical link between the great Egyptian religions and the Church of Rome, drawing rituals and philosophy from both camps. The Society did not long survive the death of its founder (he managed to reach the age of 106 incidentally) but has been revived in succeeding centuries by a series of rivalling factions.

Perhaps the most famous of these is the Rosicrucian Order which has become well-known in the Western world as a result of its heavy advertising in the popular press. Founded by the American H. Spencer Lewis, this offers a simple and good-natured doctrine preaching the Brotherhood of Man, the reincarnation of the soul and the immense latent potential of the human mind.

S

Sabbatarianism, the belief held by those Christians who regard the first day of the week as the Sabbath and wish to respect it as a holy day according to the 4th Commandment. Sabbatarianism became a principal characteristic of Presbyterianism (*q.v.*).

Observance of the Sabbath has declined in recent years along with the general fall in church attendance and the advent of sporting, leisure and now shopping, gaming and more relaxed licensing laws on the Sabbath since 1994.

Salafism, a form of Sunni Islam. The movement has strict, conservative views and its followers are sometimes known as Wahabis (*see* **J53**).

Salvation Army. The religious movement which in 1878 became known by this name arose from the Christian Mission meetings which the Rev. William Booth and his devoted wife had held in the East End of London for the previous thirteen years. Its primary aim was, and still is, to preach the gospel of Jesus Christ to men and women untouched by ordinary religious efforts. The founder devoted his life to the salvation of the submerged classes whose conditions at that time were unspeakably dreadful. Originally his aim had been to convert people and then send them on to the churches, but he soon found that few religious bodies would accept these "low-class" men and women. So it was that social work became part of their effort. Practical help like the provision of soup-kitchens, accompanied spiritual ministration.

Soon, in the interests of more effective "warfare" against social evils, a military form of organisation, with uniforms, brass bands, and religious songs, was introduced. Its magazine *The War Cry* gave as its aim "to carry the Blood of Christ and the Fire of the Holy Ghost into every part of the world.'

General Booth saw with blinding clarity that conversion must be accompanied by an improvement of external conditions. Various books had earlier described the terrible conditions of the slums, but in 1890 he produced a monumental survey entitled *In Darkest England and the Way Out*. From that time forward the Army was accepted and its facilities made use of by the authorities. Today its spiritual and social activities have spread across the whole world; every one, no matter what class, colour, or creed he may belong to, is a "brother for whom Christ died."

Scepticism. From the Greek, *skepsis*, enquiry or questioning. The philosophical attitude of doubting claims to knowledge. It springs from observations that the senses are unreliable, that the best methods often fall short of reaching the truth, and that experts often disagree. Sceptical attitudes emerge early in ancient Greek philosophy, but were only systemized into a school of thought by Pyrrho (*c.* 360–*c.* 270 B.C.). The Greek Sceptics proposed *epoche*, or suspension of belief, and aimed at *ataraxia*, tranquility of mind.

Scepticism is a recurring theme in Western philosophy, for example in Montaigne (1533–92) and Bayle (1647–1706). The most powerful sceptical thinker of the modern age is David Hume (1711–76). His arguments throw doubt upon induction, the notion of causality, the identity of the self and the existence of the external world.

The term is associated with Descartes (1596 1650), though Descartes himself is not a sceptic. It refers to his "method of doubt", which attempted to put knowledge upon a sure foundation by suspending Judgement on any proposition whose truth could be doubted, until one can be found that is absolutely certain. This secure point is the famous "I think therefore I am".

Scholasticism. From the time of Augustine to the middle of the 9th cent. philosophy, like science, was dead or merely a repetition of what had gone before. But about that time there arose a new interest in the subject, although (since by then Western Europe was entirely under the authority of the Catholic Church) the main form it took was an attempt to justify Church teaching in the light of Greek philosophy.

Those who made this attempt to reconcile Christian beliefs with the best in Plato and Aristotle were known as "schoolmen" and the philosophies which they developed were known as "scholasticism." Among the most famous schoolmen must be counted John Scotus Erigena (*c.* 800–*c.* 877), born in Ireland and probably the earliest; St. Anselm, archbishop of Canterbury (1033 1109); the great Peter Abelard whose school was in Paris (1079–1142); Bernard of Chartres, his contemporary; and the best-known of all, St. Thomas Aquinas of Naples (1225–74), who was given the name of the "Angelic Doctor."

The philosophies of these men are discussed under various headings (**God and Man, Determinism and Free-will**), but being severely limited by the Church their doctrines differed from each other much less than those of later philosophical schools. However, one of the great arguments was between the orthodox Realists (*q.v.*) and the Nominalists (*q.v.*) and a second was between the Thomists (or followers of St. Thomas Aquinas) and the Scotists (followers of John Duns Scotus—not to be confused with John Scotus Erigena).

The two latter schools were known as the Ancients, whilst the followers of William of Occam, the Nominalist, were known as the Terminalists. All became reconciled in 1482 in face of the increasing threat from humanism of which the great exponent was Erasmus of Rotterdam (1466–1536).

Scientology, an applied religious philosophy dealing with the study of knowledge, which through the application of its technology, claims to bring about desirable changes in the conditions of life. The word Scientology comes from the Latin word *Scio* (knowing in the fullest meaning of the word) and the Greek word *Logos* (study of). Developed and founded by author, philosopher and humanitarian L. Ron Hubbard (1911–86). Scientology purports to explain all of life's difficulties and contradictions in terms of occurrences in past lives. These mental blocks are removed so the individual can return to the deified state from which he came many incarnations ago.

Until the late 1960s the worldwide headquarters was in East Grinstead, Sussex. This is now the UK headquarters. Scientology ® is a registered trademark.

Secularism. *See* **God and Man** and **Rationalism.**

Semiology, Semiotics. These two words are now used almost interchangeably. The original sense of semiotics was the study of signs and sign-using behaviour, and was propounded by the American philosopher Peirce (1839–1914). Semiotics was divided into three branches: syntactics, the study of grammar; semantics, the study of meaning; and pragmatics, the study of the purposes and effects of meaningful utterances. Under the influence of the French linguist de Saussure (1857–1913) the term has broadened to the study of any means by which human beings communicate, not only through language, but also through gestures, clothes, objects, advertisements *etc.*

Societies have a multiplicity of language-like "codes" by which objects like cars and buildings have cultural meanings over and above their functions.

Shakers, members of a revivalist group, styled by themselves "The United Society of Believers in Christ's Second Appearing," who seceded from Quakerism in 1747 though adhering to many of the Quaker tenets. The community was joined in 1758 by Ann Lee, a young convert from Manchester, who had "revelations" that she was the female Christ; "Mother Ann" was accepted as their leader. Under the influence of her prophetic visions she set out with nine followers for "Immanuel's land" in America and the community settled near Albany, capital of New York state.

They were known as the "Shakers" in ridicule because they were given to involuntary movements in moments of religious ecstasy. Central to their faith was the belief in the dual role of God through the male and female Christ: the male principle came to earth in Jesus; the female principle, in "Mother Ann." The sexes were equal and women preached as often as men at their meetings which sometimes included sacred dances—nevertheless the two sexes, even in dancing, kept apart.

Their communistic way of living brought them economic prosperity, the Shakers becoming known as good agriculturists and craftsmen, noted for their furniture and textiles. After 1860, however, the movement began to decline and it is now virtually extinct.

Shamans, the medicine men found in many primitive societies who used their magical arts to work cures, and protect the group from evil influences.

The *shaman* was a man apart and wore special garments to show his authority.

Shiites or Shia, a Muslim sect, opposed by the orthodox Sunnites who see them as heretics. The dispute, which came almost immediately after the death of the Prophet and led to bitter feuding, had little to do with matters of doctrine as such but with the succession. After Mohammed's death, there were three possible claimants: Ali, the husband of his daughter Fatima, and two others, one of whom gave up his claim in favour of the other, Abu Bakr. The orthodox selected Abu Bakr, who was shortly assassinated, and the same happened to his successor as Ali was passed over again. The Shiites maintain that Ali was the true vicar of the Prophet, and that the three orthodox predecessors were usurpers.

In Iraq, the majority Shiites enjoyed a revival of influence after the fall of Saddam Hussein (under whose regime they were oppressed). They are dominant in Iran. Elsewhere Shia now number 60% of the population in Iraq, 60% in Bahrein, 40% in Lebanon, 30% in Kuwait and 12% in Saudi Arabia.

Current Shiite-Sunni conflicts in the Middle East are causing major population shifts.

Shintoism, literally means "teaching of the Gods". It is a native Japanese religion, with a strong bias towards ancestor worship and the divine powers of natural forces. Unusual in that it had no recognised founder nor written dogma, Shintoism permeated Japanese life in a most vigorous way until the defeat of the country at the hands of the Allied Powers in 1945. In the 1500 years of its existence the Shinto religion produced tens of thousands of unique and beautiful shrines throughout Japan. Vast numbers of these were destroyed by bombing in the Second World War.

Shintoism was disestablished by the US occupying forces in 1945 and Hirohito "abdicated" his divine powers.

The first written record of Shinto beliefs and customs was completed in A.D. 712.

Shoah or catastrophe is the name often given by Jews to the period of persecution by the Nazis during World War II. Yom Ha-Shoah is a day of remembrance for the near six million Jewish victims of the Holocaust. It is marked simply with special services and the lighting of candles. A special ceremony takes place at Yad Veshem, the permanent Holocaust memorial outside Jerusalem. A law passed by the Israeli Knesset forbids public entertainment on the evening of 27 Nisan.

Sikhism. The Sikh community of the Punjab, which has played a significant part in the history of modern India, came into being during a period of religious revival in India in the 15th and 16th cent. It was originally founded as a religious sect by Guru (teacher) Nanak (1469–1538) who emphasised the fundamental truth of all religions, and whose mission was to put an end to religious conflict. He condemned the formalism both of Hinduism and Islam, preaching the gospel of universal toleration, and the unity of the Godhead, whether He be called Allah, Vishnu, or God. His ideas were welcomed by the great Mogul Emperor Akbar (1542–1605). Thus a succession of Gurus were able to live in peace after Nanak's death; they established the great Sikh centre at Amritsar, compiled the sacred writings (the *Adi Granth*), and improved their organisation as a sect.

But the peace did not last long, for an emperor arose who was a fanatical Muslim, in face of whom the last Guru, Govind Singh (1666–1708), whose father was put to death for refusal to embrace Islam, had to make himself a warrior and instil into the Sikhs a more warlike spirit.

A number of ceremonies were instituted by Govind Singh; admission to the fraternity was by special rite; caste distinctions were abolished; hair was worn long; the word singh, meaning lion, was added to the original name. They were able to organise themselves into 12 *misls* or confederacies but divisions appeared with the disappearance of a common enemy and it was not until the rise of Ranjit Singh (1780–1839) that a single powerful Sikh kingdom was established, its influence only being checked by the English, with whom a treaty of friendship was made. After the death of Ranjit Singh two Anglo-Sikh wars followed, in 1845–46, and 1848–49, which resulted in British annexation of the Punjab and the end of Sikh independence. In the two world wars the Sikhs proved among the most loyal of Britain's Indian subjects.

The partitioning of the subcontinent of India in 1947 into two states, one predominantly Hindu and the other predominantly Muslim, presented a considerable problem in the Punjab, which was divided in such a way as to leave 2 million Sikhs in Pakistan, and a considerable number of Muslims in the Indian Punjab.

Although numbering less than 3 per cent. of the population the Sikhs are a continuing factor in Indian political life. Demands for Sikh independence led to the storming by Indian troops of the Golden Temple at Amritsar on 6 June 1984. In October 1984, Mrs. Gandhi was assassinated by Sikh extremists.

There are now around 423,000 Sikhs in England and Wales. The largest Sikh temple outside India was opened in Southall (which boasts a very large Sikh community) in March 2003. Other large Sikh communities are in Birmingham and Leicester. The first Sikh arrived in Britain in 1854.

Worldwide, Sikhism is the fifth largest religion in the world. There are *c* 30 million Sikhs worldwide.

Slavery. *See* **Anti-Slavery International.**

Socialism, is a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality, using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign, colonial, social, and economic policies alike.

The word "socialism" first came into general use in England *c.* 1834 in connection with Robert Owen's "village of cooperation" at New Lanark. About the middle of the 19th cent., Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns *etc.* founded a Socialist League in 1886.

With the development of trade unions the socialist movement took a more practical trend. Fabianism (*q.v.*) associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw, aimed at the gradual reorganisation of society by creating intelligent public opinion by education and legislation. The British Labour Party believed in peaceful and constitutional change to socialism by democratic methods based upon popular consent. The Labour Government of 1945–51 initiated a major period of social reform and public ownership and remains perhaps the greatest reforming government of the 20th century.

Socialists oppose the liberal view that government should be principally concerned with individuals' rights to property and freedom. Socialists argue that people are integrally social and political animals and seek to live in a society that values cooperation, common ownership, and mutual assistance instead of competition, private property, and self-interest.

Whilst socialism in the 19th century emphasised economic inequalities, throughout the 20th century socialism broadened its old horizons with a concern for the importance of gender, race, sexuality and culture in our social relationships. Consequently, movements such as the New Left in Britain have campaigned for greater justice and equality for women, ethnic minorities, and homosexual people, whilst emphasising that the machinery of exploitation and oppression operates through cultural practices as well as economic.

Soka Gakkai, Japan's largest religious organisation with 10 million followers. Founded in 1930 as the lay arm of a venerable Buddhist sect.

Solipsism. The theory that nothing really exists but oneself and one's mental states. No philosopher has deliberately held this view, but it is often seen to follow from certain views, for example, the belief that all one can know is oneself and one's immediate knowledge. The theory is intrinsically absurd, but it is difficult to refute.

Spiritualism is a religion which requires to be distinguished from psychical research (*q.v.*) which is a scientific attempt carried on by both believers and non-believers to investigate psychic phenomena including those not necessarily connected with "spirits"—*e.g.*, telepathy or clairvoyance and precognition. As a religion (although for that matter the whole of history is filled with attempts to get in touch with the "spirit world") Spiritualism begins with the American Andrew Jackson

Davis who in 1847 published *Nature's Divine Revelations*, a book which is still widely read. In this Davis states that on the death of the physical body, the human spirit remains alive and moves on to one or another of a considerable range of worlds or "spheres" where it commences yet another stage of existence. Since the spirit has not died, but exists with full (and possibly even expanded) consciousness, there should be no reason, Davis argues, why it should not make its presence known to the beings it has temporarily left behind on earth.

The movement today, which still has a large and often articulate following, now concentrates on the less controversial areas of "mental mediumship," clairvoyance and the like, or on the very widespread practice of "spirit healing." Where people are not deliberately deluded by bogus mediums acting for monetary reward, Spiritualism may have an emotional role to play in the life of people whose happiness has been affected by bereavement.

Stalinism. The methods and policies associated with Joseph Stalin (1879–1953), leader of the USSR from 1929 until his death. This form of despotism consisted of the concentration of power in his own hands, and the ruthless suppression of dissent, plus a "cult of personality", which used every means of propaganda to present Stalin as a benevolent ruler. For many historians, Stalin is the greatest mass murderer of modern times (along with Mao and Hitler).

State and Man. Most of the early civilisations such as those of Egypt and Babylonia were theocratic, that is to say, they were arranged in a hierarchy with, at the peak, a king who was also an incarnation of the god. It is with the rise of the city states of ancient Greece that the problem really began to be discussed.

The Greek Approach. The early pre-Socratic philosophers Democritus and the Pythagorean school for example, held that the individual should subordinate himself to the whole; they had no doubt that the citizen's first duty was to the state. The Greeks until the time of Plato were not really thinking in terms of individual rights, nor had they given much thought to what form the state should take—they simply accepted it. The first great attempt to describe the ideal state is to be found in Plato's *The Republic* which is referred to elsewhere (*see* **Education**). His pupil Aristotle did not try to form a utopia but made many comments on the nature of government. Thus, while agreeing that the state was more important than any individual person, he distinguished between good and bad states, and pointed out that to the extent that the state does not enable its citizens to lead virtuous and useful lives it is evil. A good constitution must recognise the inequalities between human beings and confer on them rights according to their abilities: among these inequalities are those of personal ability, property, birth, and status, as freeman or slave. The best forms of rule were monarchy, aristocracy, and democracy; the worst forms—tyranny, oligarchy (or rule of a powerful few), and ochlocracy (or mob-rule). The later Greek thinkers of Hellenistic times held two opposed points of view. The Epicureans (*q.v.*) taught that all social life is based upon self-interest and we become members of a group for our own convenience; therefore there are no absolute rights and laws—what is good is what members decide at that time to be good, and when they change their minds the law must change too. Injustice is not an evil in any god-given sense; we behave justly simply because if injustice became the general rule, we ourselves should suffer. The Stoics (*q.v.*), on the other hand, held that the state must dominate the individual completely and everyone must carry out, first and foremost, his social duties and be willing to sacrifice everything for it; but the state of the Stoics was no narrowly national one, but one that strove to become a universal brotherhood.

The Christian Approach. The orthodox Christian view is expressed in St. Augustine's book *The City of God*. Here it is held that the church, as the worldly incarnation of the City of God, is to be supreme over the state, and the head of the church is to be supreme over secular rulers. In addition it must be recognised that, whilst the secular ruler can make mistakes, the church does not, since it is the representative of God's kingdom on earth.

The Secular State. During the Renaissance (*q.v.*) many rulers, petty and otherwise, were seeking absolute authority. Two notable thinkers at this stage were Niccolo Machiavelli (1469–1527) in Italy and Thomas Hobbes (1588–1679) in England, where, of course, the Renaissance arrived later in history. Both supported absolute monarchy against the former domination of the church. The name of Machiavelli has become a by-word for any behaviour that is cunning and unscrupulous, but he was not really as bad as he is usually painted. It is, indeed, true that in his book *The Prince* he showed in the greatest detail the methods by which a ruler could gain absolute control and destroy civic freedom, but this despotism was intended as merely a necessary intermediate stage towards his real idea which was a free, united Italian nation wholly independent of the church.

Hobbes was a materialist whose thesis was that man is naturally a ferocious animal whose basic impulse is war and pillage and the destruction of whatever stands in his way to gain his desires. But if he allowed himself to behave in this way his life would be "nasty, brutish, and short" so he creates a society in which he voluntarily gives up many of his rights and hands them over to a powerful ruler in his own interest. But having done this he must obey; even when the ruler is unjust, as he has no right to complain because anything is better than a return to his natural state.

The religion of the king must be the religion of the people and the only things no ruler has the right to do is to cause a man to commit suicide or murder or to make him confess to a crime.

Views of Locke: Live and Let Live. John Locke (1632–1704) disagreed with these views. Man is naturally peaceful and co-operative and therefore social life comes readily to him. He sets up an authority in order to preserve the group and that is why laws are made; but the function of the state is strictly limited to maintaining the public good and beyond this men are to be left free. Therefore absolute power and the doctrine of the Divine Right of Kings were wrong because power ultimately rests with the people who have the right to make and break governments. It is also wrong that those who make the laws should be able to execute them. This is the important British doctrine of the separation of powers between the legislature and the executive which is regarded as one of the bases of democracy.

Rousseau's Social Doctrine. The only other views that we need to consider here are those of Jean-Jacques Rousseau (1712–78) and Herbert Spencer (1820–1903), since the views of the two important intervening figures, Hegel and Karl Marx, are dealt with elsewhere (*see* **Dialectical Materialism**) and after Spencer we come to a stage where political philosophy begins to merge with sociology and the social sciences. Rousseau is a puzzling figure. On the one hand he has been hailed as the prophet of freedom and on the other as the father of modern totalitarianism. His book *Social Contract* (1762) begins with the words: "Man is born free, and everywhere he is in chains." He says that he is in favour, not merely of democracy, but of direct democracy in which everyone has to give his assent to all measures as in the Greek city-states and in Geneva, of which city he was a citizen. (This method is still in force in respect of some measures in the Swiss cantons.)

Natural society is based on a "social contract" or mutual agreement and Rousseau speaks of a "return to nature" which would ensure the sovereignty of the people at all times. Thus far, he seems to agree with Locke but soon we find that he is more akin to Hobbes, since (as the twentieth century showed) nothing is more tyrannical than the absolute rule of all the people. (Public opinion is more Hitlerian than Hitler.) As it turns out, then, the "social contract" consists in "the total alienation of each associate, together with all his rights, to the whole community" and "each of us puts his person and all his power in common under the supreme direction of the general will."

Rousseau admired direct democracy in the small city-state, but if his doctrine is applied to large states, then the "general will" becomes absolute. It is in this sense that he is regarded as the forerunner of totalitarianism. Herbert Spencer is quoted only as an example of the inappropriate application of a biological theory to social issues. Influenced by Darwin's thesis of natural selection, he saw in society a struggle in which the fittest survived and the less fit perished. Each individual had the right to preserve himself, but in the case of human beings this depended upon group life in which, to some extent, each individual is limited by the rights of others. But this should not go too far, and he condemned the socialism of J. S. Mill which (*a*) would give over-much protection to the unfit, and (*b*) would give the state powers which it has no right to since the best government is the least government. In accordance with Darwinism free competition was essential.

State Capitalism. Lenin's description of the compromise made with financial interests in 1918 to ensure Communist survival, while simultaneously reinforcing central control over the economy. More recently, a pejorative description of Soviet socialism in which a privileged bureaucracy is said collectively to dominate economic life with the same relationship to the working class as employers under private capitalism.

Stoics, the followers of Zeno, a Greek philosopher in the 4th cent. B.C., who received their name from the fact that they were taught in the Stoa Poikile or Painted Porch of Athens. They believed that since the world is the creation of divine wisdom and is governed by divine law, it is man's duty to accept his fate. Zeno conceived virtue to be the highest good and condemned the passions. (*See* **God and Man, State and Man, Determinism and Free-will.**)

Structuralism. 1. Psychology. The name of a school of thought whose influence has not lasted. It sought to investigate the structure of consciousness through the analysis, by introspection, of simple forms of sensation, thought, images, *etc.* and then find out how these components fitted together in complex forms. The school, which is mainly identified with Edward Titchener (1867–1927), discounted the value of analysing the significance of mental experience, and of examining the functions of the mind.

2. Linguistics. The theory that language is best described in terms of its irreducible structural units in morphology (the study of word structure) and phonology (the study of sound systems).

3. Social Sciences. Theories or methods of analysis characterised by a preoccupation, not simply with structures, but with such structures as can be held to underlie and generate the phenomena under observation. To use a distinction of the linguist Noam Chomsky (b. 1928), the concern is with deep structures rather than surface structures. The main influences on the movement have been the theories of the French anthropologist Claude Levi-Strauss (1908–2009). According to him, universal patterns of cultural and social systems are products of the invariant "deep" structure of the human mind. He believed that structural similarities underlie all cultures and that an analysis of the relationships between cultures could provide insight into innate and universal principles of human thought.

Structural analysis has also been applied to literary theory, *e.g.* by the French critic Roland Barthes (1915–80). *See under* **Literary Theory**.

Subjectivism. In moral philosophy, the belief that all moral attitudes are merely a matter of personal taste. According to this an assertion like "Abortion is wrong" does not express an objective truth but means that the speaker or, more broadly, his society, or people in general, disapprove of abortion.

Sufism. A mystical movement within Islam. It started as a reaction against the legalistic approach of early Islam, seeking to establish a more personal relationship with Allah, or God. The objective of Sufism is perfection of the individual and union with God. Sufi orders were first established in the 12th century and some are still thriving today. Sufism has been very important in the history of Islamic faith and had a great influence on Muslim literature, and created a genre of mystical love poetry.

Suicide. *See* **Euthanasia.**

Sukkot, a Jewish holiday, also called the Feast of Tabernacles.

Sunnites, the orthodox sect of Islam (*q.v.*) as contrasted with the Shiites or Shia (*q.v.*).

Surrealism. *See* **Section N.**

Swedenborgianism. The Church of the New Jerusalem, based on the writings of Emanuel Swedenborg (1688–1772), was founded by his followers eleven years after his death. The New Church is essentially a movement bearing the same relationship to Christianity as Christianity does to Judaism. Swedenborg's many works include the 12-volume *Arcana Caelestia* (*Heavenly Secrets*) (1749–56).

Synchronicity, an attempt by the psychologist, Carl Gustav Jung, to explain the apparently significant relationship between certain events in the physical universe which seem to have no obvious "causal" link. This rather involved concept is easily understood if one realises that almost all scientific and philosophical beliefs are based on the notion that the continuous process of change which is taking place in ourselves and in the universe around us is dependent upon a principle known as causality.

We can express this another way by saying an object moves because it has been pushed or pulled by another. We see because light strikes the retina and signals pass up the nervous system to the brain. A stone falls to the ground because the earth's gravity is pulling it towards its centre, *etc.*, *etc.* For all practical purposes every event can be looked upon as being "caused" by some other prior event and this is obviously one of the most important principles of the operation of the universe. Jung, however, felt that there is a sufficiently large body of evidence to suggest that events may be linked in a significant (*i.e.*, non-chance) way without there being any true causal relationship between them.

The classic example he held to be the supposed predictive power of astrology by which there appears to be a relationship between the stellar configurations and the personality and life-pattern of individuals on earth. Jung was scientist enough to realise that there could be no causal connection between the aspect of the stars and the lives of people billions of miles from them, yet felt the evidence for astrology was strong enough to demand an alternative non-causal explanation.

The trouble with synchronicity, which has not made much impact on the world of physics or of psychology, is that it is not really an explanation at all but merely a convenient word to describe some puzzling correspondences. The real question, of course, is whether there really are events occurring which are significantly but not *causally* linked, and most scientists today would hold that there were not.

Syndicalism, a form of socialist doctrine which aims at the ownership and control of all industries by the workers, contrasted with the more conventional type of socialism which advocates ownership and control by the state. Since syndicalists have preferred to improve the conditions of the workers by direct action, *e.g.*, strikes and working to rule, rather than through the usual parliamentary procedures, they have been closely related to anarchists (*q.v.*) and are sometimes described as anarcho-syndicalists.

Under syndicalism there would be no state; for the state would be replaced by a federation of units based on functional economic organisation rather than on geographical representation. The movement had bodies in the United Kingdom, where guild socialism (*q.v.*) was strongly influenced by its doctrines, in France, Germany, Italy, Spain, Argentina, and Mexico, but these gradually declined after the first world war.

Fascism (*q.v.*)was also strongly influenced by the revolutionary syndicalism of Georges Sorel.

T

Talmud. *See* **Judaism.**

Tantra. 1. Tantric Buddhism. Tantra refers to a series of ritual texts said to have been first transmitted by the Buddha himself. The tantras speak of the evocation of various gods, the pursuit of magical powers, the use of chants, and the attainment of enlightenment through meditation and yoga. Tantric theory and practice is a development within the Mahayana Buddhist tradition. It died out in India but moved to Tibet. The most famous tantra is the *Tibetan Book of the Dead.*

2. **Tantric Hinduism.** Within Hinduism tantra refers to a group of Sanskrit texts not part of the orthodox Veda (*see* **Hinduism**). These are concerned with acquiring spiritual power and liberation in life, through practices aiming at purifying the body and controlling one's mental processes.

Taoism is still one of the great Eastern creeds. Its alleged founder, Lao-tze, is said to have been born in Honan about 604 B.C.; he is also said to be the author of the bible of Taoism, the *Tao-te-ching*, or in English *The Way of Life*, and to have disapproved of Confucius.

This would hardly be surprising; for Taoism is eminently a mystical religion recommending doing nothing and resisting nothing, whereas **Confucianism** (*q.v.*) is eminently a practical code of living and its founder insisted on intervening in everything to do with social life. But the truth as revealed by modern scholarship is rather different. We are told that the poems of the *Tao-te-ching* are anonymous and probably originated among recluses in lonely valleys long before the time of Confucius; they were collected and given form at some time late in the 3rd cent. B.C. and their authorship attributed to Lao-tze. It is entirely possible that no such peson ever existed (unlike Confucius, who certainly did), but if there were such a man he appears to have used a pseudonym since "Lao" is not a surname but an adjective meaning "old" and it was customary to attribute important works to old men on account of their supposed wisdom.

Lao-tze simply means "the old philosopher", and although the *Tao-te-ching* is one of the most remarkable and instructive books ever written it is as anonymous as the Border Ballads.

It is apparent that the religion learned both from the ancient Chinese mystics and from Brahmanism: *Tao*, the Way, is impalpable, invisible, and incapable of being expressed in words. But it can be attained by virtue, by compassion, humility, and non-violence. Out of weakness comes true strength whereas violence is not only wrong but defeats its own ends. There is no personal God and such gods as men imagine are mere emanations of *Tao* which gives life to all things. *Tao* is Being. Works are worthless and internal renunciation is far better than anything that follows from the use of force because passive resistance convinces the other from within that he is in error, whereas violence only compels the external appearance of conviction whilst inwardly the individual is as before. "It is wealth to be content; it is wilful to force one's way on others."

Later Lao-tze became a divinity and indeed one of a Trinity each worshipped in the form of idols (which the founder had hated). Soon there was worship of the forces of nature: the stars, the tides, the sun and moon, and a thousand other deities among whom Confucius was one. The purest mysticism and wisdom had been utterly corrupted by contact with the world.

Taoism is now reviving in China where its membership has tripled in the last 20 years.

Telepathy and Clairvoyance. Telepathy is the alleged communication between one mind and another other than through the ordinary sense channels. Clairvoyance is the supposed faculty of "seeing" objects or events which, by reason of space and time or other causes, are not discernible through the ordinary sense of vision. Such claims have been made from time immemorial but it was not until the 20th century that the phenomena were investigated scientifically. The first studies were undertaken by the Society for Psychical Research, which was founded in 1882 with Professor Henry Sidgwick as its first president.

It would be odd if some scientists were not interested in ESP because of the enormous weight of anecdotal evidence which has built up over centuries to support it. The weakness of the scientific as opposed to the casual evidence is however exemplified by the failure of ESP researchers to produce a reliable "repeatable" experiment.

Terrorism. A form of political violence used against governments, groups or individuals with the purpose of creating a climate of fear in which the aims of the terrorists may be fulfilled. The term derives from the "Reign of Terror" in the French Revolution. In the 20th century it was closely associated with the violence of small political movements of both the extreme left and right, attempting to overthrow existing political institutions.

It has often been used as part of nationalist movements seeking to remove colonial governments, as in the expulsion of Britain from Kenya and France from Algeria. There is also what is known as "*state terrorism*", as practised by totalitarian regimes such as Hitler's Germany and Stalin's Soviet Union. The 'War on Terror' was launched by the United States following the al-Qaeda attack of 11 September 2001.

Theism. *See* **God and Man.**

Theosophy (Sanskrit *Brahma Vidya* = divine wisdom), a system of thought that draws on the mystical teachings of those who assert the spiritual nature of the universe, and the divine nature of man. It insists that man is capable of intuitive insight into the nature of God. The way to wisdom, or self-knowledge, is through the practice of **Yoga** (*q.v.*). Theosophy has close connections with Indian thought through Vedic, Buddhist, and Brahmanist literature. The modern Theosophical Society was founded by Mme H. P. Blavatsky and others in 1875, and popularised by Mrs. Annie Besant.

Third Way (**New Labour**). Social democratic political parties suffered successive defeats at the hands of neoliberal conservatives throughout the 1980s and 1990s. New Labour/Third Way politics attempted to apply and adapt traditional social democratic values to this hostile political landscape. Third Way politicians such as Bill Clinton and Tony Blair accepted the policies of privatisation, low taxes, and reduced welfare provision, and in many cases extended neoliberal policies to areas of public services untouched by Thatcher and Reagan. Whilst rejecting increased progressive taxation, Third Way/New Labour politicians attempted to promote social justice by spending the fruits of growing neoliberal economies on health, education, and anti-poverty measures.

This increase in public spending redistributed wealth in some areas of society, for example child poverty in the UK. Increasingly, Third Way/New Labour policies changed the role of the state from owner and direct provider, to regulator and enforcer of central government's targets.

Traditional social democrats argue that Third Way/New Labour politics ignores the value of equality in social justice, and neoliberal conservatives argue that Third Way/New Labour public spending is parasitic on their economic reforms and legacy of growth.

New Labour was finally buried in September 2015 when Jeremy Corbyn became Labour leader.

Toronto Blessing. *See* **Pentecostalism.**

Tory, a name given in 1680 by English Protestants to those who did not wish to exclude a Catholic heir from the succession to the throne of Charles II. It then remained the name of one of the two great political parties (*see* **Whigs**) until 1832, when the Tory Party restyled itself the Conservative Party. The term now denotes a supporter or member of the Conservative Party.

Totalitarianism. Totalitarian government is one which tolerates only one political party, to which all other institutions are subordinated, and which usually demands the complete subservience of the individual to the government. The Italian dictator Mussolini coined the term in the 1920s to describe the new fascist state of Italy, and the word has become synonymous with absolute single-party government, as in Nazi Germany or SovietRussia.

Totalitarianism is distinguished from authoritarianism, dictatorship, and tyranny as it employs the tools of industrial modernity to enforce its control. It is therefore often regarded as a distinctly 20th century phenomenon, where technology allows authoritarian, dictatorial tyrannies to control and direct society to an unprecedented total extent.

Totemism. A totem is an animal, plant or object with which a social or religious group feels a special affinity and which is often considered to be the mythical ancestor of the group. The totem is worshipped or esteemed by members of the group or clan bearing its name. Totemism is the form of social organization consisting of such clans. Membership of the clan is inherited and lifelong; but marriage is usually with a partner outside the totemic clan. Totem poles (as erected by North American Indians) are a way of representing the clan's guardian spirit. Totemism has been important in the religion and society of many less developed peoples.

Tractarianism, a Catholic revival movement, also known as the **Oxford Movement** (not to be confused with the so-called Oxford Group), which had its beginnings at Oxford in 1833. The leaders included the Oxford high churchmen E. B. Pusey, J. Keble and J. H. Newman.

Through the *Tracts for the Times* (1833–41), a series of pamphlets which were sent to every parsonage in England, they sought to expose the dangers which they considered to be threatening the church from secular authority. The immediate cause of the movement was the Reform Act (1832) which meant that the state was no longer in the safe keeping of Tories and Churchmen but that power was falling into the hands of Liberals and Dissenters. They advocated a higher degree of ceremonial in worship nearer the Roman communion. In *Tract 90* (the last) Newman showed how the Thirty-nine Articles themselves, which were regarded as the bulwark of Protestantism, could be made to square with Roman doctrine. It was obvious which direction the movement was taking and the romanizing tendency was widely resented. In 1845 Newman went over to Rome. He was beatified in 2010.

Pusey and Keble persisted in their efforts to secure recognition of Catholic liturgy and doctrine in the Anglican Church. Catholicism of the Anglican type (*i.e.*, Catholic in ritual, ceremony, and everything save submission to the Pope) is termed Anglo-Catholicism (*q.v.*).

Transcendental Meditation, popularised in the West by the Maharishi Mahesh Yogi, who achieved sensational worldwide publicity by his "conversion" of the Beatles. This is a simple meditational system which it is claimed is an aid to relaxation and the reduction of psychological and physical stress. It is a technique which can be taught in a relatively short, concentrated period of time, provided that someone trained by the Maharishi is the teacher. The pupil or would-be meditator is given a *mantra*—letting his thoughts flow freely while sitting in a comfortable position. Very many claims are made on behalf of the system. As with most cults, religious and occult systems, there is an initial psychological benefit to anyone who becomes deeply involved. Nevertheless, apart from this simple "participation-effect", there is some evidence that the body's autonomic functions (heart rate, respiratory cycle, brain waves, *etc.*) can be modified by certain individuals including yogis.

The movement in Britain is based at Mentmore Towers in Buckinghamshire. The movement recruits heavily on campuses in America, but has been the subject of many complaints by parents.

Transcendentalism. 1. A term used to refer to the transcendental idealism of Immanuel Kant (1724–1804). *See* **Mind and Matter**.

2. A movement established in the United States in the 1830s, much influenced by German idealism and Platonism, which included Ralph Waldo Emerson (1803–82) and Henry Thoreau (1817–62) among its main members. Transcendentalism's characteristic belief was in the supremacy of insight over logic and experience for the revelation of the deepest truths. It tended towards mysticism, pantheism and optimism about the progress of the spirit. Although the movement's followers believed that true reform must come from within the individual, they took part in contemporary reform movements.

Transcendentalism itself faded with the coming of the American Civil War, but it had a strong influence on the writings of Whitman, Emily Dickinson and Hawthorne.

Transubstantiation, the conversion in the Eucharist of the bread and wine into the body and blood of Christ—a doctrine of the Catholic Church.

Trinity. The Christian doctrine that God exists in three persons, all co-equal, and indivisible, of the same substance—God the Father, God the Son (who became incarnate as Jesus), begotten of the Father, and God the Holy Ghost, proceeding from Father and Son. The system denying the Trinity is Unitarianism (*q.v.*).

Trotskyism, a form of communism supporting the views of Leon Trotsky, the assumed name of Lev Bronstein (1879–1940) who, in 1924, was ousted from power by Stalin and later exiled and assassinated in Mexico. Trotsky held that excessive Russian nationalism was incompatible with genuine international communism and that Stalin was concentrating on the economic development of the Soviet Union to an extent which could only lead to a bureaucratic state with a purely nationalist outlook.

After the Hungarian uprising in 1956, which was ruthlessly suppressed by the Soviet Armed Forces, a wave of resignations from Western Communist parties took place, many of the dissidents joining the Trotskyist movement. Trotsky laid emphasis on the idea of 'permanent revolution' and his supporters formed the Fourth International.

Trotskyism in Britain was influenced by Tony Cliff's *State Capitalism in Russia* (1955) and the formation of the Socialist Workers' Party, and the Militant tendency. Both Militant and the SWP sought to agitate for revolution by influencing working class organisations and most notably, in the case of Militant, entering the Labour Party.

Trotskyite Militants developed a particular position of strength in Liverpool, and attempted to implement an ambitious programme of public expenditure whilst freezing income. It is argued that the strategy was to induce a crisis in traditional democratic institutions that Trotskyites believed oppressed workers, and to ferment revolutionary fervour in the midst of such chaos.

Today the Socialist Workers' Party remains the most active Trotskyist group in Britain, but its numerical support is very small. Also active is the Alliance for Workers' Liberty.

In the 2015 general election it fielded candidates standing as Trade Union and Socialist Coalition (TUSC).

U

Ufology. *See* **Flying Saucers.**

Uniates, a sometimes derogatory term for the Eastern Orthodox Churches which are in full communion with the Roman Catholic Church, recognise the authority of the Pope and in faith and doctrine are totally Catholic. However, they retain their traditional liturgies and separate canon law and permit their priests to marry.

Unification Church (**Moonies**). Better known to outsiders as the Moonies, the Unification Church is part of a larger organisation now known as the Family Federation for World Peace and Unification. Its founder was the Reverend Sun Myung Moon, who in 1936, at the age of 16, had a vision of Christ who told him to further God's Kingdom on Earth. Following intensive personal prayer and study, he began preaching in 1945. Following release from Communist imprisonment in North Korea, he founded the Unification Church in 1954.

The group continue to be anti-communist and have been linked to several right-wing politicians around the globe. They have significant business interests and own the *Washington Times* amongst other companies. Moon himself was prosecuted for tax evasion and was criticised for the scale of his personal fortune. The Church also has a charity wing, the International Relief Friendship Foundation and sponsors cultural enterprises.

In 1959, the Church expanded abroad, using young people to raise the profile, finances and recruitment by selling flowers and candles on the street. The Church was particularly accused of 'love-bombing' new recruits into full membership. Amongst its main tenets is the authority of Moon's own publication *Discourse on the Principle* or *Divine Principle* as equal to the Bible. One key principle is the understanding of the Fall in which Eve has sex with the fallen angel Lucifer and then with Adam in repentance. It is this abuse of love which caused mankind's separation from God. Jesus was sent to restore the ideal family, the Church's Trinity of God, Man and Woman, by having a family rather than in death and resurrection. His failure required the resending of the Messiah, Moon himself, to establish the perfect marriage, although he has had between two and four wives.

Despite these claims, the Church believes that neither Jesus nor Moon is God, but that they are prophets. Mass arranged marriages with partners selected by Moon have become the hallmark of the movement, although they are not legally binding.

Sun Myung Moon himself died in 2012, aged 92.

Unitarianism has no special doctrines, although clearly, as the name indicates, belief is in the single personality of God, *i.e.*, anti-trinitarian. This general statement, however, can be interpreted with varying degrees of subtlety. Thus unitarian belief may range from a sort of Arianism which accepts that, although Christ was not of divine nature, divine powers had been delegated to him by the Father, to the simple belief that Christ was a man like anyone else, and his goodness was of the same nature as that of many other great and good men. Indeed, today many Unitarians deny belief in a personal God and interpret their religion in purely moral terms, putting their faith in the value of love and the brotherhood of man. The Toleration Act (1689) excluded Unitarians but from 1813 they were legally tolerated in England. Nevertheless attempts were made to turn them out of their chapels on the ground that the preachers did not hold the views of the original founders of the endowments. But this ended with the Dissenting Chapels Act of 1845. In America no such difficulties existed, and in the Boston of the 19th century many of the great literary figures were openly unitarian in both belief and name: *e.g.*, Emerson, Longfellow, Lowell.

United Reform Church. *See* **Presbyterianism.**

Universal Declaration of Human Rights. This landmark in the evolution of human rights was adopted in 1948 by the UN General Assembly in Paris. Among other things, it recognised the "inherent dignity" and "inalienable rights of all members of the human family". The Declaration built on the 'Four Freedoms' announced by Franklin D. Roosevelt in 1941 – freedom of speech and expression, of religion, from want and from fear.

Untouchables (**Dalits**), the lowest caste in Hindu society. There are over 200 million in India. They suffer persecution and are under pressure to revert to Hinduism if they have converted. *See* **Hinduism**.

Utilitarianism, a school of moral philosophy of which the main proponents were J. S. Mill (1806–73) and Jeremy Bentham (1748–1832). Bentham based his ethical theory upon the utilitarian principle that the greatest happiness of the greatest number is the criterion of morality. What is good is pleasure or happiness; what is bad is pain. If we act on this basis of self-interest (pursuing what we believe to be our own happiness), then what we do will automatically be for the general good. The serious failing of this thesis is (1) that it makes no distinction between the quality of one pleasure and another, and (2) that Bentham failed to see that the law might not be framed and administered by men as benevolent as himself. J. S. Mill accepted Bentham's position in general but seeing its failings emphasised (1) that self-interest was an inadequate basis for utilitarianism and suggested that we should take as the real criterion of good the social consequences of the act; (2) that some pleasures rank higher than others and held that those of the intellect are superior to those of the senses.

Not only is the social factor emphasised, but emphasis is also placed on the nature of the act.

Utopias. The name 'utopia' is taken from two Greek words meaning 'nowhere' and was first used in 1516 by Sir Thomas More (1478–1535) as the title of his book referring to a mythical island in the south Pacific where he sited his ideal society. Since then it has been used of any ideal or fanciful society. More's *Utopia* and James Harrington's *The Commonwealth of Oceana* (1656) shared a similar concern with the causes of human misery, and presented their imaginary societies as ideals against which the iniquities of their contemporary realities were rendered vividly.

These early modern English utopias described societies where land and property were owned in common, thereby arguing strongly that private property creates conflict and a self-interested striving for advantage that undermines personal and civic virtue. In More's *Utopia* society was guided by the good of the community, and featured compulsory schooling, free health care, and equality between the sexes. Harrington's republican commonwealth allowed all citizens to share in governance through secret ballots, a written constitution, and a separation of powers between legislature and executive. These ideas compared starkly with the attitudes and institutions of their authors' day, and the genre of the utopia allowed for serious moral and political questions to be raised in fictional setting.

Saint-Simon. Claude Henri, Comte de Saint-Simon (1760-1825), writing in his *New Christianity* (1825), developed the previous utopian writers' commitment to a shared ownership of property. Saint-Simon opposed inheritance and promoted an ideal society where each worked for the public good and was rewarded according to merit. Saint-Simon's work is regarded as a foundation of French socialism, and marked the close relationship that utopian and socialist thought would develop throughout the 19th century.

Fourier and Owen. This relationship was further expressed in the work of François Fourier and Robert Owen. Fourier's utopia features people who are integrally good and co-operative. When organised into small productive units, called phalanxes, these idealised people could live without the need for central government. Their lives would be occupied with productive and necessary work, and although they would be allowed private property, this property would be widely dispersed through the sale of shares. Fourier's ideas found popularity with many social reformers in the USA, and were taken up by Thoreau, Hawthorne, and Emerson. An American Fourier colony known as Brook Farm was established and carried on for eight years.

Robert Owen (1771–1858) a wealthy textile manufacturer and philanthropist, established communities founded on a kind of utopian socialism in Lanarkshire, Hampshire, and in America. The workers in Lanark were given better housing and education for their children, and it was administered as a co-operative self-supporting community in Scotland. Whilst the social experiments of followers of Fourier and Owen may not have achieved lasting effect, they showed that not all utopias are entirely fanciful and imaginary.

More Recent Writings. Whilst utopian writing continued into the 20th century, notably in the genres of fantasy and science fiction, many authors have sought to explore imagined societies characterised by catastrophe and failure. George Orwell's *1984* (published in 1949) is an imagined dystopia where democracy and liberty have collapsed into unremitting totalitarianism.

Feminist authors have used dystopic writing to characterise the oppression of women, and Margaret Atwood's *The Handmaid's Tale* (1986) is an important work in this area.

V

Vaisakhi, the most important day in the Sikh calendar. It commemorates the beginning of Sikhism as a collective faith.

Vedanta. An ancient system of Indian thought. It is expressed in commentaries on the *Brahma Sutras*. A key figure is Shankara (788–820 A.D.) who founded what is known as Advaita Vedanta.

Vegans, *see under* **Vegetarianism**.

Vegetarianism, a way of life practised by those who abstain from meat. Strict vegetarians (Vegans) also excude all animal products (*e.g.* butter, eggs milk) from their diet as well as "hidden" animal products such as gelatin and rennet (an enzyme used to make cheese). Around 542,000 people in Britain class themselves as Vegans.

Vitalism, the philosophical doctrine that the behaviour of the living organism is, at least in part, due to a vital principle which cannot possibly be explained wholly in terms of physics and chemistry. This belief was held by the rationalist thinker C. E. M. Joad (1891 1953) and is implicit in Henri Bergson's (1859–1941) theory of creative evolution. It was maintained by Bergson that evolution, like the work of an artist, is creative and therefore unpredictable; that a vague need exists beforehand within the animal or plant before the means of satisfying the need develops. Thus we might assume that sightless animals developed the need to become aware of objects before they were in physical contact with them and that this ultimately led to the origins of organs of sight.

During the 20th century a form of vitalism described as "emergent evolution" was put forward. This theory maintains that when two or more simple entities come together there may arise a new property which none of them previously possessed. Today biologists would say that it is the *arrangement* of atoms that counts, different arrangements exhibiting different properties, and that biological organisation is an essentially dynamic affair.

W

Wahabis, members of an Arabian sect of Islam which originated in the teaching of Muhammad Ibn Abd-al-Wahab, born at the end of the 17th cent. He was deeply resentful of Ottoman rule which, in addition to its tyranny, had brought about innovations in the religion which Muhammad regarded as a perversion of its original form. He proceeded to reform Islam to its earliest conditions and impressed his beliefs on Sheikh Mohammed Ibn Saud.

Under the successors of Ibn Saud the power of the Wahabis spread over much of Arabia where it is dominant today in Saudi Arabia. Its particular characteristic is that it refuses to accept symbolic or mystical interpretations of the words of the Prophet and accepts quite literally the teaching of Islam. It is, in fact, a type of Muslim fundamentalism. Although crushed by the Ottomans in 1811–15, the movement remains an important element in Islam.

Partly in reaction to what it sees as the decadence of the West, and partly as a result of Saudi oil wealth, it now wields increasing influence.

Waldenses (Waldensians), a movement also known as "The Poor Men of Lyons," founded by Peter Waldo of that city about the same time, and in the same part of southern France, as the Albigenses (*q.v.*) with whom, however, they had nothing in common.

Their main belief was a return to Apostolic simplicity, based on reading the Bible in their own language; their doctrines were somewhat similar to those of the Mennonites and the Quakers. However, they did not wish to separate themselves from the Church and were originally protected by several Popes until the Lateran Council of 1215 excluded them mainly for the crime of preaching without ecclesiastical permission. From this time they were subjected to persecution, yet maintained some contact with the Church until the Reformation when they chose to take the side of the Protestants. Situated mainly on the sides of the Alps, half in Piedmont and half in France, they were persecuted or not according to the contemporary political convenience of the Dukes of Savoy, and the major attempt to destroy them called forth Oliver Cromwell's intervention and the famous sonnet of Milton. The sect survived, and still exists, having been granted full equality of rights with his Catholic subjects by Charles Edward of Piedmont in 1848.

Wandjina, the ancestral spirit beings of the Aboriginal people in Western Australia. They can be found depicted on cave walls and rock shelters.

Weathermen. Far left group whose aim was to overthrow the American political system. The group's name was borrowed from the lyrics of songwriter Bob Dylan. Its membership was drawn from the well-educated, and it committed specific and well-planned acts of violence.

Whig. In 1680, a term derisively applied to politicians who sought to exclude Roman Catholics from succession to the throne, it thereafter became the name of the political party opposed to the Tory (*q.v.*) party. At first dominated by the nobility, it represented those forces which hoped to limit the power of the monarch and to increase the power of Parliament. The Whigs (the governing party in 1868 under Gladstone) formed an element in the emerging Victorian Liberal Party.

Witchcraft, the exercise of supposedly supernatural powers for evil purposes (black magic). It has a history dating back to classical times (*e.g.* the enchantress Medea in Greek mythology). Accounts of witchcraft were widespread in the medieval period and Draconian opposition to its practices by the Church led to scores of witch trials, ruthless persecution and torture. Between 1400 and 1750 it is estimated over 100,000 people, the vast majority women, were prosecuted for witchcraft .

Many innocent people perished, especially after the promulgation of the bull *Summis desiderantes* by Pope Innocent VIII in 1484. In 1494 the *Malleus Maleficarum* (Hammer of Witches) codified the rules for detecting acts of witchcraft.

Today it is now known that the victims of the famous Salem witch trials in North America were suffering from ergot poisoning, which was mistaken for witchcraft. Three centuries later they have finally been exonerated. In the 1990s, the Catholic Church established a commission in the Czech Republic to review the notorious Sumperk witch trials of 1679 (when 100 people were burnt alive in Moravia). It is a sign of changing attitudes.

Few people realise how deeply the notion of witchcraft is implanted in our minds. For example, the Witchcraft Act was not finally repealed in Britain until the 1950s. In the Australian State of Victoria it was not legalised until 2005!

The last woman to be executed in Europe for witchcraft (the Swiss maid Anna Goeldi in 1782) was finally exonerated in 2008. The last conviction for witchcraft in England was in 1712. In 1736 the Witchcraft Act in England finally ended witch hunts and trials.

Today, *wicca* is the fastest-growing religious group in the United Kingdom. Witchcraft can still be found in parts of Africa and Asia (*e.g.* Tanzania and Assam). Doreen Valiente is hailed as the "mother of modern witchcraft".

Women's Liberation Movement. *See under* **Feminism.**

World Congress of Faiths, an inter-religious movement which aims to break down barriers between faiths. The first step was taken by the world's parliament of religions held in Chicago in 1893; similar gatherings were held subsequently at intervals in Europe; but the actual organisation was formed in 1936 by Sir Francis Younghusband; and now an annual conference is held.

World Council of Churches, a forum of Christian Churches from all over the world (including the Churches of the Protestant, Anglican, and Orthodox traditions, but excluding the Roman Catholic Church), engaged in extending Christian mission and unity throughout the world. This modern ecumenical movement stems from the great World Missionary Conference held at Edinburgh in 1910. The World Council was founded in 1948 and meets for consultation from time to time.

World Federalism, the extension of the principle of federalism (already an established political system in such countries as Canada, Germany, Switzerland and the USA) to a world, international order, to prevent wars and to tackle *global* issues on a *global* basis. The Association of World Federalists campaigns for this objective.

Y

Yazidis, members of an ancient and secretive faith, a synthesis of Zoroastrianism and Christianity. Found in Iraq, Syria, Georgia and America they have been persecuted by militant Islamists. Back in 1892 they were slaughtered by the forces of the Ottoman Empire.

Yin and **Yang,** the two basic forces in ancient Chinese thought. Yang is associated with masculinity, heat, light, creation *etc.*, yin with femininity, coldness, dark, passivity *etc. See also* **Confucianism, Taoism.**

Yoga, a Hindu discipline which teaches a technique for freeing the mind from attachment to the senses, so that once freed the soul may become fused with the universal spirit (*atman* or Brahman), which is its natural goal. This is the sole function of the psychological and physical exercises which the Yogi undertakes, although few ever reach the final stage of *Samadhi* or union with Brahman which is said to take place in eight levels of attainment. These are: (1) *Yama,* which involves the extinction of desire and egotism and their replacement by charity and unselfishness; (2) *Niyama*, during which certain rules of conduct must be adopted, such as cleanliness, the pursuit of devotional studies, and the carrying out of rituals of purification; (3) *Asana*, or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the "lotus position" familiar from pictures); (4) *Pranayama*, the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive, the first being complete absorption in the act of breathing which empties the mind of any other thought, the second being the ability almost to cease to breathe which allegedly enables him to achieve marvellous feats of endurance; (5) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense; (6) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM; (7) *dhyana*, meditation, which finally leads to (8) *Samadhi* the trance state which is a sign of the complete unity of soul with reality.

Yoga is very old, and when the sage Patanjali (*c.* 300 B.C.) composed the book containing these instructions, the *Yoga Sutras*, he was probably collecting from many ancient traditions perhaps dating back to *c.*2, 500 B.C. Some of the claims made by Yogis seem, to the Western mind, frankly incredible; but in the West Yoga methods have been used at the lower levels in order to gain improved self-control, better posture, and improved health.

Yom Kippur, the Day of Atonement, the final day of repentance begun at Rosh Hashanah, and the holiest day in the Jewish calendar. It is referred to as the Sabbath of Sabbaths and is typified by twenty-five hours of fasting. Prior to this is a feast with festival candles. Each individual must attempt to confess not only their sins to God, but ask forgiveness from others on the eve of Yom Kippur.

An important part of the *teshuvah* or repentance is the general confession in the synagogue. Readings will tell of the ancient atonement involving a scapegoat in Leviticus; Deuteronomy 30, and the prophetic book of Jonah. The message of all is God's infinite capacity to forgive even those who are undeserving. The last service of the day will end with the opening of the Shema, 'Hear O Israel, the Lord is our God. The Lord is One', and the triumphant cry of Elijah, 'The Lord, He is God'. The last act will be the blowing of the *shofar* to bring the fast to a close.

Z

Zen Buddhism, a Buddhist sect which is believed to have arisen in 6th century. China but has flourished chiefly in Japan. The sect places absolute faith in a person's own inner being. Apparently the intention is that, so far from indulging in inward meditations or such practices as the Yogi uses, the student must learn to act spontaneously, without thinking, and without self-consciousness or hesitation.

This is the main purpose of the *koan*, the logically insoluble riddle which the pupil must try to solve. One such is the question put by master to pupil: "A girl is walking down the street, is she the younger or the older sister?" The correct answer, it seems, is to say nothing but put on a mincing gait, to *become* the girl, thus showing that what matters is the experience of being and not its verbal description. Another *koan*: "What is the Buddha?" "Three pounds of flax" is attributed to T'ungshan in the 9th cent. and a later authority's comment is that "none can excel it as regards its irrationality which cuts off all passages to speculation." Zen, in effect, teaches the uselessness of trying to use words to discuss the Absolute.

Zen came to Japan in the 13th cent., more than five centuries after Confucianism or the orthodox forms of Buddhism, and immediately gained acceptance whilst becoming typically Japanese in the process. One of the reasons why it appealed must have been that its spontaneity and insistence on action without thought, its emphasis on the uselessness of mere words, and such categories as logical opposites, had an inevitable attraction for a people given to seriousness, formality, and logic to a degree which was almost stifling. Therefore Zen began to impregnate every aspect of life in Japan, and one of the results of its emphasis on spontaneous action rather than reason was its acceptance by the Samurai, the ferocious warrior class, in such activities as swordsmanship, archery. Japanese wrestling, and later Judo and the Kamikaze dive-bombers. But much of Japanese art, especially landscape gardening and flower-arrangement, was influenced similarly, and Zen is even used in Japanese psychiatry.

The very strict life of the Zen monks is based largely on doing things, learning through experience; the periods of meditation in the Zendo hall are punctuated by sharp slaps on the face administered by the abbot to those who are unsatisfactory pupils. Maybe it is its appearance of nihilism and its appeal to the irrational and spontaneous which attracts the Western world at a time when to many the world seems without meaning and life over-regimented. The three main schools of Zen Buddhism are Soto, Rinzai and Obaku.

However, it has influenced such various aspects of Western life as philosophy (Heidegger), psychiatry (Erich Fromm and Hubert Benoit), writing (Aldous Huxley), and painting (*Die Zen Gruppe* in Germany).

Zionism, a belief in the need to establish an autonomous Jewish home in Palestine which, in its modern form, began with Theodor Herzl (1860–1904), a Hungarian journalist working in Vienna. Although Herzl was a more or less assimilated Jew, he was forced by the Dreyfus case and the pogroms in Eastern Europe to conclude that there was no real safety for the Jewish people until they had their own state.

The Jews, of course, had always in a religious sense thought of Palestine as a spiritual homeland and prayed "next year in Jerusalem," but the religious had thought of this in a philosophical way as affirming old loyalties, not as recommending the formation of an actual state. Thus Herzl was opposed both by many of the religious Jews and, at the other extreme, by those who felt themselves to be assimilated and in many cases without religious faith.

Even after the Balfour Declaration of 1917, there was not a considerable flow of Jews to Palestine, which at that time was populated mainly by Arabs. But the persecutions of Hitler changed all this and, after bitter struggles, the Jewish state was proclaimed in 1948. Today Zionism is supported by the vast majority of the Jewish communities everywhere. In the 1990s, a major exodus of Jews from Russia to Israel (made possible by the demise of the Soviet Union) introduced a new phase in the history of Zionism.

Zoroastrianism was at one time one of the great world religions. Under the Achaemenidae (*c.* 550–330 B.C.) Zoroastrianism was the state religion of Persia. Alexander's conquest in 331 B.C. brought disruption but the religion flourished again under the Sassanian dynasty (A.D. *c.* 226–640). With the advance of the Muslim Arabs in the 7th cent. Zoroastrianism finally gave way to Islam. A number of devotees fled to India there to become the Parsees (literally meaning "Persians in India"). In Iran itself a few scattered societies remain, perhaps numbering around 30,000 followers. Globally, there are *c.* 145,000 adherents.

The name Zoroaster is the Greek rendering of Zarathustra, the prophet who came to purify the ancient religion of Persia. It is thought that he lived at the beginning of the 6th cent. B.C. He never claimed for himself divine powers but was given them by his followers.

The basis of Zoroastrianism is the age-long war between good and evil, Ahura Mazda heading the good spirits and Ahriman the evil ones. Morality is very important since by doing right the worshipper is supporting Ahura Mazda against Ahriman, and the evil-doers will be punished in the last days when Ahura Mazda wins his inevitable victory.

The sacred book of this religion is the *Avesta*. If Zoroastrianism has little authority today, it had a very considerable influence in the past. Its doctrines penetrated into Judaism (*q.v.*) and, through Gnosticism, Christianity. The worship of Mithra by the Romans was an impure version of Zoroastrianism. Manichaeism (*q.v.*) was a Zoroastrian heresy and the Albigensianism of mediaeval times was the last relic of a belief which had impressed itself deeply in the minds of men.

The best known practice of the faith is probably sky burial.

GAZETTEER OF THE BRITISH ISLES

This concise gazetteer of the British Isles includes not only towns and cities but also a variety of natural features, from lakes and mountains to forests and rivers. Also included are many smaller places with special literary, musical, artistic or military links as well as those associated with our industrial heritage.

and unselfishness; (2) *Niyama*, during which certain rules of conduct must be adopted, such as cleanliness, the pursuit of devotional studies, and the carrying out of rituals of purification; (3) *Asana*, or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the "lotus position" familiar from pictures); (4) *Pranayama*, the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive, the first being complete absorption in the act of breathing which empties the mind of any other thought, the second being the ability almost to cease to breathe which allegedly enables him to achieve marvellous feats of endurance; (5) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense; (6) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM; (7) *dhyana*, meditation, which finally leads to (8) *Samadhi* the trance state which is a sign of the complete unity of soul with reality.

NOTES FOR USERS OF THE GAZETTEER

Industries.

In many countries (not least Britain) old industries have gradually faded away. Because the gazetteer aims to be in part a historical guide, mention of these industries has been retained (even though the factories may have closed).

Population Figures.

Total population figures from a census count are no longer regarded as necessarily more accurate than estimates arrived at by other methods. The usefulness of censuses lies rather in the additional information which they provide. Even so, some countries like the Netherlands have given up censuses altogether.

The gazetteer therefore no longer distinguishes between census figures and estimates but includes reliable figures from whatever source. For smaller towns, population figures below 20,000 are not always given here.

New Cities.

To celebrate the Millennium, three places were granted city status. These were Inverness, Wolverhampton and Brighton & Hove. Five more cities were created to mark the 2002 Golden Jubilee. These were Preston, Newport (in Gwent), Stirling and, in Northern Ireland, Lisburn and Newry. In the previous 40 years, the only cities to be created were Swansea (1969), Derby (1977), Sunderland (1992) and, in 1994, Armagh and St. Davids. For the 2012 Diamond Jubilee, three new cities were named: Chelmsford, Perth and St Asaph.

Census 2011.

The last census took place on 27 March 2011. The results showed a fast-growing population, especially in cities such as Manchester, Leicester and parts of London (*e.g.* Newham, Tower Hamlets). Britain's population also has increasing numbers of over-65s.

'The total population of England and Wales on Census day was 56·1 million. One in six (9·2 million) were aged 65 or over.' Those over 90 had risen from 336,000 to 429,000. Over half the population were women.The next decennial census is due in 2021. It is likely to be the last survey in its present form.

Local Government Reorganisation 1996.

The eight counties of Wales were replaced on 1 April 1996 by 22 unitary authorities and the 12 regions of Scotland by 32 unitary authorities. Thirteen English unitary authorities were also created on that date, with a further 13 being created on 1 April 1997.

Local Government Reorganisation 2009.

On 1 April 2009, extensive reorganisation took place in the old counties of Cornwall, Durham, Northumberland, Shropshire and Wiltshire. In each of these 5 counties a single "super-size" unitary authority replaced the old local government structure. In Bedfordshire and Cheshire, the old structure was replaced by two new unitary authorities in each county. In all 44 old authorities were replaced by 9 new bodies.

A

Abbots Langley, v., Herts., **Eng.**; birthplace of Nicholas Breakspeare (Pope Adrian IV).

Abercarn, t., Caerphilly, **Wales**; tinplate, knitting pins; former colliery t.; p. 15,100.

Aberdare, t., Rhondda, Cynon, Taff, **Wales**; on R. Cynon: wire cables; former coal-mng.; p. 29,040.

Aberdeen, royal burgh, unit.auth. created in 1996, formerly part of Grampian, E. **Scot.**; between mouths of Rs. Dee and Don; impt. fishing pt.; established itself as centre of rapidly growing N. Sea oil ind.; "granite-city"— much granite used in central bldgs.; univs., cath.; p. (2011) 223,000 (unit.auth.).

Aberdeenshire, E. **Scot.**, unit.auth. created in 1996, incorporating historic co. which became part of Grampian in 1974; bordered N. and E. by N. Sea; inc. cstl. ts. of Fraserburgh, Peterhead and Stonehaven; p. (2010) 243,500.

Aberfeldy, burgh, Perth and Kinross, **Scot.**; in Strath Tay, 6 km below Loch Tay; mkt.; salmon and trout fishing resort; p. 1,900.

Abergavenny, sm. t., Monmouthshire, **Wales**; on R. Usk; scene of massacre of Welsh chiefs; light engin.; cas.; p. 26,000.

Aberlour, Charlestown of, burgh, Moray, **Scot.**; on R. Spey, 19 km S. of Elgin; p. 790.

Abernethy, burgh, Perth and Kinross, **Scot.**; on R. Tay, once cap. of Pictish Kings; p. (2002) 945.

Abertillery, sm. t., Blaenau Gwent, **Wales**; formerly collieries, tinplate.

Aberystwyth, t., Ceredigion, **Wales**; on Cardigan Bay at mouth of R. Ystwyth, resort; cas., univ.; Nat. Library of Wales; p. (2006) 12,700. Its pier was the first to be built in Wales.

Wandsworth, inner bor., S.W. London, **Eng.**; inc. Battersea; on R. Wandle at influx into Thames; oil mills, metal wks., paper, formerly brewing; p. (2011) 307,000.

Wansbeck, R., Northumberland, **Eng.**; flows E. from Pennines into N. Sea 5 km N. of Blyth.

Wansbeck, former l. gov. dist., Northumberland, **Eng.**; inc. Newbiggin, Ashington and Bedlington. Abolished, 2009.

Wantage, mkt. t., Oxon., **Eng.**; in Vale of the White Horse; birthplace of King Alfred.

Wapping, Thames-side dist.; ctr. of printing inds. (some now moving); London, **Eng.**

Ware, sm. mkt. t., East Herts., **Eng.**; on R. Lea; 3 km N.E. of Hertford.

Wareham, sm. mkt. t., Purbeck, Dorset, **Eng.**; on R. Frome, on N. of I. of Purbeck, 13 km S.W. of Poole.

Warminster, sm. t., West Wilts., **Eng.**; on Wylye watershed at edge of Salisbury Plain; agr. mkt.

Warrenpoint, sm. spt., Newry and Mourne, **N. Ireland**; at head of Carlingford Lough.

Warrington, t., unit. auth., Cheshire, **Eng.**; on R. Mersey and Manchester Ship Canal; metal inds. (wire-drawing), chemicals, brewing, paper; expanded as new c. (to take people from Manchester); attracting high technology inds.; p. (2011) 202,200 (unit. auth.).

Warsop, sm. t., Notts., **Eng.**; 6 km N.E. of Mansfield; limestone, gravel.

Warwick, co. t., l. gov. dist., Warwicks., **Eng.**; on R. Avon, 13 km S.W. of Coventry; cas.; agr. implements, brewing, malting; p. (2010) 136,000 (dist.); 25,000 (t.).

Warwickshire, non-met. co., W. Midlands, **Eng.**; undulating, drained by tribs. of Rs. Severn and Trent, crossed by Cotswolds to S.; sm. coalfield to N.; potential new coalfield in S.; p. (2010) 531,500.

Wash, The, bay, N. Sea between Lincs. and Norfolk, **Eng.**; 35 km long, 24 km wide; partly reclaimed to form the Fens.

Washington, t., Tyne and Wear, **Eng.**; 8 km S.E. of Gateshead; coal, iron and steel, stone quarrying, chemicals; new t. 1964; p. 54,000.

Wast Water, L. Dist., deepest L. in **Eng.**; 5 km long, 79 m deep.

Watchet, sm. t., West Somerset, **Eng.**; sm. pt. on cst. of Bristol Channel.

Waterford, co., Munster, **R.o.I.**; mtnous. co. in S.E.; mainly agr., dairying, pigs; fishing; co. t. Waterford; a. 1,867 km^2; p. (2011) 66,960.

Waterford, co. t., spt., Waterford, **R.o.I.**; on R. Suir; cath.; brewing, fishing, glass mnfs.; p. (2011) 46,747 (t.).

Watford, t., l. gov. dist., Herts., **Eng.**; on R. Colne, 26 km N.W. of London; mkt.; varied inds.; paper, printing; home of Camelot (lottery operator) and Leavesden film studio; p. (2010) 81,000 (dist.).

Waveney, R., Norfolk and Suffolk, **Eng.**; 80 km long.

Waveney, l. gov. dist., Suffolk, **Eng.**; based on Lowestoft, Beccles and Bungay; p. (2010) 118,000.

Waverley, l. gov. dist., Surrey, **Eng.**; inc. Farnham, Godalming and Haslemere; p. (2010) 119,000.

Weald, The, wooded and pastoral tracts S.E. **Eng.**; extending from Folkestone, Kent, through Surrey, Hants., and Sussex to the sea at Beachy Head; former a. of iron working; name derived from German *Wald* = forest.

Wealden, l. gov. dist., East Sussex, **Eng.**; stretches from Uckfield to S. cst.; p. (2010) 143,000.

Wear, R., Durham/Tyne and Wear, **Eng.**; rises in Pennines, flows through Durham to N. Sea at Sunderland; 96 km long.

Wear Valley, former l. gov. dist., Durham, **Eng.**; Pennine a. inc. Bishop Auckland, Crook and Willington. Abolished, 2009.

Weaver, R., Cheshire, **Eng.**; industl. trib. of R. Mersey; 72 km long.

Wednesbury, t, West Midlands, **Eng.**; former metal wkg. t.

Wednesfield, t., West Midlands, **Eng.**; metal tubes, materials handling engin.; expanded t.

Wellingborough, t., l. gov. dist., Northants., **Eng.**; on R. Nene, 14 km N.E. of Northampton; mkt.; footwear; expanded t.; p. (2010) 76,500 (dist.), (2001) 46,959 (t.).

Wellington, sm. mkt. t., Somerset, **Eng.**; 10 km S.W. Taunton, anc. woollen ind. still survives.

Wells, cath. t., Mendip, Somerset, **Eng.**; on S. flank of Mendip hills; cath., bishop's palace; paper mftg.; tourism; p. 10,250.

Welshpool, mkt. t., Powys, **Wales**; on R. Severn; nearby is Powys cas.; p.5,900.

Welwyn Garden City, t., Welwyn-Hatfield, Herts., **Eng.**; 34 km N. of London; founded by Sir Ebenezer Howard (1920) as first satellite t. of London; new t. 1948; pharmaceuticals, plastics, radio, and electronics, lt. inds.; p. (2011) 43,000.

Welwyn Hatfield, l. gov. dist., Herts., **Eng.**; comprises Welwyn Garden City and Hatfield; p. (2010) 108,000.

Wembley, former M.B., Middx., **Eng.**; now inc. in Brent outer bor. Greater London; lt. inds.; home of Wembley Stadium (now redeveloped as 90,000 seat stadium); British Empire Exhibition 1924–5. Wembley Stadium scene of England's 1966 World Cup triumph. Wembley Arena (formerly the Empire Pool, once the world's longest pool).

Wenlock Edge, narrow ridge, Shrops., **Eng.**; extends 29 km S.W. from Much Wenlock to Craven Arms; limestone; moorland, mainly above 290 m.

Wensleydale, North Yorks., **Eng.**; valley in N. Pennines drained E. by R. Ure; cattle reared for fattening on lowland farms; some dairying (cheese); length 56 km.

Wessex, anc. kingdom, S. **Eng.**; inc. Berks., Hants., Wilts., Dorset, Somerset and Devon. It was "the realm of the Western Saxons".

West Berkshire, unit. auth., Berks, **Eng**. p. (2010) 153,900.

West Bridgford, t., Rushcliffe, Notts., **Eng.**; at junc. of Grantham canal with R. Trent; residtl. sub. of Nottingham; p. 44,900.

West Bromwich, t., Sandwell, West Midlands, **Eng.**; on R. Thame, 8 km N.W. of Birmingham; heavy engin. and allied inds., chemicals, springs, oil refining; new Alsop-designed arts centre (2008); p. 139,000.

West Derbyshire. *See* **Derbyshire Dales.**

West Devon, l. gov. dist., Devon, **Eng.**; rural W. of Dartmoor and ts. of Tavistock and Okehampton; p. (2010) 53,000.

West Dorset, l. gov. dist., Dorset, **Eng.**; inc. Lyme Regis, Bridport, Sherborne and Dorchester; p. (2010) 97,000.

West Dunbartonshire, unit. auth. created in 1996, formerly part of Strathclyde, W. **Scot.**; bordered S. by R. Clyde and N. by Loch Lomond; p. (2010) 91,000.

Western Isles, l. gov. auth., **Scot.**; remote a. of Outer Hebrides; pastoral farming and fishing are the traditional livelihood; p. (2010) 26,200.

West Ham, former C.B., Essex, **Eng.**; sub. to E. of London; bordered by Rs. Thames and Lea; now inc. in Newham bor., Greater London.

West Lancashire, l. gov. dist., Lancs., **Eng.**; N. of Merseyside, inc. Skelmersdale and Ormskirk; p. (2010) 109,000.

West Lindsey, l. gov. dist., Lincs., **Eng.**; lge. a. N. of Lincoln and inc. Market Rasen and Gainsborough; p. (2010) 89,000.

West Lothian, central **Scot.**; unit. auth. created in 1996, incorporating most of historic co. which became part of Lothian in 1974 and is now divided between Edinburgh, Falkirk, and W. Lothian; industl. dist. in Central Lowlands close to Edinburgh; p. (2010) 171,250.

Westmeath, co., Leinster, **R.o.I.**; drained by R. Shannon, many Ls.; dairying; co. to Mullingar; ch. t. Athlone; a. 1,834 km²; p. 85,961.

West Mersea, sm. t., Essex, **Eng.**; on Mersea I.

West Midlands, former met. co., **Eng.**; mainly industl. a. centred around Birmingham and the S. Staffs. coalfield (Black Country) and Coventry; many forms of engin. and light inds. inc. vehicle mftg.; p. (2001) 2,555,592.

Westminster, City of, inner bor., London, **Eng.**; on N. bank of R. Thames; W. of City of London; incorporates former bors. of Paddington and St. Marylebone; contains Houses of Parliament, Westminster Abbey, Government offices, Royal Palaces (Buckingham Palace and St. James's); p. (2011) 219,500.

Westmorland, historic co., **Eng.**; now part of Cumbria.

Weston-super-Mare, t., in N. Somerset loc. govt. dist.; **Eng.**; on Bristol Channel, 32 km S.W. of Bristol; holiday resort; pier destroyed by fire, 2008; renovated (2010); expanded t.; p. 73,500.

West Oxfordshire, l. gov. dist., Oxon., **Eng.**; inc. Cotswolds and ts. of Chipping Norton, Witney and Woodstock; p. (2010) 102,000.

Westport, spt., Mayo, **R.o.I.**; on Clew Bay; fishing; mkt.; p. *c.* 3,500.

Westray, I., Orkney Is., **Scot.**; 16 km long.

West Somerset, l. gov. dist., Somerset, **Eng.**; inc. Exmoor and cstl. ts. of Watchet and Minehead; p. (2010) 35,400.

West Sussex, non-met. co., S.E. **Eng.**; crossed by E.–W. chalk ridge of S. Downs and forested Weald; diverse agr.; dormitory, retirement and tourist ts. on cst. inc. Bognor Regis and Worthing; Crawley new t. in N.; p. (2010) 782,300.

Westward Ho!, v., N. Devon, **Eng.**; named after Kingsley's novel.

West Wiltshire, former l. gov. dist., Wilts., **Eng.**; stretches from Melksham, Bradford-on-Avon and Trowbridge to Warminster. Abolished, 2009.

West Yorkshire, met. co., **Eng.**; industl. and mainly built-up a. E. of Pennines; traditionally ass. with woollen textile mftg.; inc. major ctrs. of Bradford and Leeds; p. (2001) 2,079,211.

Wetherby, sm. t., West Yorks., **Eng.**; on R. Wharfe; mkt., t.; racecourse; p. (2009) 10,560 (t.).

Wexford, coastal co., Leinster, S.E. **R.o.I.**; farming, fishing; cap. Wexford; a. 2,334 km²; p. 145,000.

Wexford, t., cap. of Wexford; Leinster, S.E. **R.o.I.**; on R. Slaney; agr. processing; outport at Rosslare; p. 11,000.

Wey, R., Hants., Surrey, **Eng.**; rises in W. Weald, flows N. into R. Thames nr. Weybridge; cuts impt. gap through N. Downs at Guildford; length 56 km.

Weybridge. *See* **Walton and Weybridge.**

Wolsingham, sm. t., Durham, **Eng.**; on R. Wear.

Wolverhampton, c., met. dist., West Midlands, **Eng.**; heavy and lt. engin., boilers, rayon, elec. engin. and apparatus, iron wks., aircraft and motor components, hollow-ware, tools, *etc.*; p. (2001) 236,582 (dist.). Created a Millennium City, 2000. New Jaguar Land Rover plant to be built.

Wolverton, t., Milton Keynes, **Eng.**; on R. Ouse, 24 km S.W. of Bedford; p. 62,000. Longest continuously opened railway works in the world (since September 1838).

Wombwell, t., South Yorks., **Eng.**; at E. foot of Pennines, 11 km N. of Sheffield; p. 16,000.

Woodbridge, sm. t., Suffolk Coastal, Suffolk, **Eng.**; on R. Deben; boat-building, tourism.

Wood Green, former M.B., Middx., **Eng.**; now inc. in Haringey outer bor., Greater London.

Woodhall Spa, t., East Lindsey, Lincs., **Eng.**; 6 km S.W. of Horncastle; former spa, bromoiodine springs; resort.

Woodstock, t., Oxford, **Eng.**; on Glyme R., 11 km N.W. of Oxford; glove mnfs.; Blenheim Palace.

Wookey Hole, cave, Mendip Hills, Somerset, **Eng.**; at foot of limestone hills, 3 km N.W. of Wells; R. Axe emerges from the cave.

Woolwich, dist. former met. bor., London, **Eng.**; on either side of R. Thames; impt. Tudor dockyard, now closed; now part of Greenwich and Newham bors. Major regeneration project (Woolwich Central) announced in 2011.

Wootton Bassett (Royal Wootton Bassett), mkt. t., N. Wilts., **Eng.**; expanded since the 1960s to provide housing for people wkg. in Swindon; national focus for hailing return of soldiers killed overseas until 2011.

Worcester, c. and l. gov. dist., Worcs., **Eng.**; on R. Severn, 38 km N. of Gloucester; cath.; machin., porcelain, glove mkg.; univ., birthplace of Elgar; p. (2011) 99,000 (dist.).

Worcestershire, historic Midland co., **Eng.**; part of Hereford and Worcs. until 1998; now recreated separate county; p. (2010) 558,500.

Workington, t., Allerdale, Cumbria, **Eng.**; sm. spt. on Solway F. at mouth of Derwent R., first Bessemer steel plant, closed (1981), engin.; industl. diversification on nearby industl. estates, inc. bus wks.; p. 21,500.

Worksop, t., Bassetlaw, Notts., **Eng.**; 24 km S.E. of Sheffield; coal-mng. dist.; brewing, knitwear, glass, flour; p. 39,100.

Worms Head, promontory at W. end of Gower Peninsula, S. **Wales.**

Worthing, t., l. gov. dist., West Sussex, **Eng.**; on S. cst., 16 km W. of Brighton; resort, popular as retirement ctr.; p. (2011) 104,000 (dist.).

Wrath, C., N.W. **Scot**. Highest mainland cliffs in Britain.

Wrekin, The, l. gov. dist., Shrops., **Eng.**; inc. Newport, Wellington, Oakengates and Dawley; p. 149,000.

Wrexham, t. 18 km S.W. of Chester, N.E. **Wales**, unit. auth. created in 1996 from former l. gov. dists. of Wrexham Maelor and Glyndŵr; p. (2011) 134,800 (unit. auth.). New 'superjail' opened. The home of Glyndwr University

Wroxeter, v., Shrops., **Eng.**; on R. Severn, 8 km S.E. Shrewsbury; Roman sta. Uriconium; lost Roman harbour uncovered (2000).

Wychavon, l. gov. dist., Worcs., **Eng.**; inc. Vale of Evesham and Pershore in S. and Droitwich in N.; p. (2011) 117,000.

Wycombe, l. gov. dist., Bucks., **Eng.**; close to Oxon. and inc. High Wycombe and Marlow; p. (2011) 171,500.

Wye, R., Bucks., **Eng.**; rises in Chiltern hills, flows S.E. to R. Thames at Cookham.

Wye, R., **Eng.** and **Wales**; rises in Plynlimmon, flows S.E. into R. Severn at Chepstow; forms deeply incised valley at Symond's Yat; 208 km long.

Wye, t., Kent, **Eng.**; nr. Ashford; impt. agr. college.

Wylfa Head, Anglesey, Isle of, N. **Wales**; Magnox nuclear power sta.

Wymondham, sm. t., South Norfolk, **Eng.**; 14 km S.W. of Norwich; mkt.; Benedictine abbey founded 1107.

Wyre, l. gov. dist., Lancs., **Eng.**; inc. Preesall, Fleetwood and Thornton Cleveleys; p. (2011) 108,000.

Wyre Forest, l. gov. dist., Worcs., **Eng.**; inc. Bewdley, Kidderminster and Stourport; p. (2011) 98,000.

Y

Yare, R., Norfolk, **Eng.**; flows E. to N. Sea at Gorleston; forms part of Norfolk Broads navigable waterways; 80 km long.

Yarmouth. *See* **Great Yarmouth**.

Yeo or **Ivel,** R., Dorset, Somerset, **Eng.**; trib. of R. Parrett; 38 km long.

Yeovil, sm. mkt. t., Somerset, **Eng.**; on R. Yeo; glove mnf., aero-engin., agr. machin., dairy processing.

Ynys Mon. *See* **Isle of Anglesey.**

York, c., unit. auth. created in 1996, formerly part of North Yorks. **Eng.**; on R. Ouse; in central position in Vale of York; anc. part of c. enclosed by walls; minster, cas., univs.; chocolate, confectionery, rly. museum; Jarvik Viking Centre; renovated Art Gallery (reopened 2015); Yorkshire Eye attraction; p. (2010) 195,000 (unit. auth.), 140,000. (c.). Magnificent York Minster.

York, Vale of, broad lowland, North Yorks/York, **Eng.**; between Pennines and N. Yorks. Moors and Yorks. Wolds; drained to Humber by R. Ouse and tribs.; glacial and alluvial soils have required draining; crop farming, wheat, barley, root-crops, associated with fattening of beef cattle; settlement mainly marginal; ch. t. York; length 96 km, width from 16 km in N. to 48 km in S.

Yorkshire, historic co., N. **Eng.**; formerly divided into 3 separate admin. parts (Ridings); N., E., and W.; now split into the non-met. co. of N. Yorks., the met. cos. of W. Yorks. and S. Yorks., and 8 unit. auths. inc. Kingston upon Hull, Middlesbrough and York. Yorkshire Dales national park now linked to Lake District national park.

Yorkshire Moors, hills, North Yorks. and Redcar and Cleveland, **Eng.**; inc. N. Yorks. Moors, Cleveland Hills and Hambleton Hills; bounded to N. by Tees valley, S. by Vale of Pickering, W. by Swale valley, E. by sea; composed of oolitic limestone; good sheep pastures; impt. iron-ore deposits worked in Cleveland Hills; max. alt. 454 m.

Yorkshire Wolds, hills, E. Riding of Yorks., **Eng.**; extend N.E. from Humber and terminate in Flamborough Head; chalk; good sheep pasture; average alt. 180 m.

Ystwyth, R., Ceredigion, **Wales**; flows 40 km to join R. Rheidol at Aberystwyth.

Z

Zetland. *See* **Shetland.**

GENERAL INFORMATION

This section contains many hundreds of entries, all arranged alphabetically. Entries range across a wide spectrum of human knowledge, from common garden birds to astrolabes and ziggurats and from religious festivals to life expectancy. There are also entries for many scientific terms, from astrophysics to zodiacal light. Readers may wish to refer to Section E for key historical terms, Section G for the Nobel Prizes and Section N for art and architecture and Section P for music and dance. Cross references direct the reader to fuller information elsewhere in the book.

COMMON WEIGHTS AND MEASURES

Introductory Note

The scientist nowadays mainly uses the SI system of units. SI is short for "*Système International d'Unités*" and it is a system of metric units which has come into international use through the agency of such bodies as the General Conference of the International Bureau of Weights and Measures and the International Organisation for Standardisation (ISO) in whose work Britain participates.

The Base SI Units

The seven main base SI units, namely the **metre**, **kilogram**, the **second**, the **ampère**, the **kelvin**, the **candela** and the **mole** are defined and discussed further on **T58–9**.

The Imperial System of Units

The SI system is not the only system of units in use today, although it is the one most favoured by scientists. The Imperial system is widely used in the UK and other English speaking countries and some Imperial weights and measures are given below:

Length

1 nail = 2_ in
1 link = 7·92 in
12 in = 1 ft
3 ft = 1 yd
22 yd = 1 chain
10 chains = 1 furlong
8 furlongs = 1 mile = 1760 yd = 5280 ft

Area

1210 yd^2 = 1 rood
4 roods = 1 acre = 4840 yd^2
640 acres = 1 $mile^2$

Volume

1728 in^3 = 1 ft^3
27 ft^3 = 1 yd^3

Capacity

4 gills = 1 pint
2 pints = 1 quart
4 quarts = 1 gallon
2 gallons = 1 peck
4 pecks = 1 bushel
8 bushels = 1 quarter
36 bushels = 1 chaldron
1 gal = 277·274 in^3

Weight (Avoirdupois)

(System used in commerce)

1 dram = 27·343 75 grains
16 drams = 1 oz = 437·5 grains
16 oz = 1 lb = 7000 grains
14 lb = 1 stone
28 lb = 1 quarter
4 quarters = 1 cwt = 112 lb
20 cwt = ton = 2240 lb

Troy Weight

1 pennyweight = 24 grains
480 grains = 1 ounce

The only unit of troy weight which is legal for use in trade in Britain is the ounce Troy, and weighings of precious metal are made in multiples and decimals of this unit.

The term *carat* is not a unit of weight for precious metals, but is used to denote the quality of gold plate, *etc.*, and is a figure indicating the number of 24ths of pure gold in the alloy, *e.g.*, a 9 carat gold ring consists of nine parts of pure gold and fifteen parts of base metals.

Nautical Measures

1 nautical mile = 6080 ft = 1853·18 m
1 knot = 1 nautical mile per hour = 1·151 mile/h

Note.—The international nautical mile of 1852 m is now used.

Some Common Equivalents

		Reciprocal
Length		
1 cm	= 0·394 in	2·540
1 m	= 1·094 yd	0·914
1 km	= 0·621 mile	1·609
Area		
1 m^2	= 1·196 yd^2	0·836
1 km^2	= 0·386 $mile^2$	2·590
1 hectare	= 2·471 acres	0·405
Volume		
1 m^3	= 1·308 yd^3	0·765
1 litre	= 0·220 gallon	4·546
Mass		
1 kg	= 2·205 lb	0·454
1 tonne	= 0·984 ton	1·016

Temperature

$C = (F - 32) \div 1{\cdot}8$
$F = (1{\cdot}8 \times C) + 32$

Some Common Abbreviations

mm = millimetre
cm = centimetre
m = metre
km = kilometre
km/h = kilometres per hour
g = gram
kg = kilogram
tonne = metric ton
m^2 = square metre
km^2 = square kilometre
ha = hectare
m^3 = cubic metre
s = second
min = minute
h = hour

Scientific and Technical Terms

A discussion of many of the more complex scientific and technical terms now in use can be found on **T58–9**.

GENERAL INFORMATION

A

Aardvark (Dutch *aarde* = earth + *vark* = pig), a large nocturnal mammal found only in Africa. It feeds on termites and ants.

Aardwolf, a small insectivore (related to the hyena family). Its acute hearing enables it to locate termites. A single aardwolf can eat 200,000 termites in a night.

Abacus, a device for making arithmetical calculations, consisting of parallel bars on which are strung movable coloured beads. The earliest form of this instrument was used in Mesopotamia about 3000 B.C. An efficient form of the abacus is still used in parts of Asia.

Abalone, shellfish regarded in the Far East as an aphrodisiac. The colourful pearly interior of the shell is used for beads and ornaments.

Aberdevine. Another name for the siskin.

Aberration, in astronomy, is the apparent displacement of a star due to the speed of the observer with the earth (*see* **Parallax**). In optics (i) **Spherical Aberration** is when there is blurring of the image and fringes of colour at its edges, due to failure of lens to bring light to a single focus; (ii) **Chromatic Aberration** is due to the refractive index of glass being different for light of different colours. For instance, violet light is bent more than red.

Abiogenesis, or spontaneous generation; the origination of living from non-living matter. The term is applied to such discredited ideas as that frogs could be generated spontaneously by the action of sunlight on mud, or maggots arise spontaneously in dead meat without any eggs from which the maggots hatch being present. Spallanzani (1729–99) upset the hypothesis; Pasteur dealt it a death-blow.

Abominable Snowman. *See* **Yeti.**

Aborigines, a term for the original inhabitants of a country, in particular the indigenous people of Australia. In contrast to their complex social and religious customs, the material culture of Australian aboriginals was very low and ill adapted to stand up to contact with Europeans.

The passage of the Native Rights Act in 1993 generated heated debate and led to the controversial Native Title Amendment Bill. In 1999 the Australian parliament formally apologised to them for the "hurt and trauma" caused by white settlement. A further apology for the "stolen generations" of children of aborigines was made in 2008. Recent years have seen a new respect for aborigine painting. Alcohol abuse and poor diet still contribute to low life expectancy. The aboriginal population is now ½ million (back to its 18th century level). The first Aborigine was elected to the Australian Parliament in August 2010 and the first Aborigine elected leader of a provincial government in 2013.

Aborigines have lived in Australia for 50,000 years since the Old Stone Age. There is evidence they studied the movements of the Sun 10,000 years ago.

Absolute Temperature, Absolute Zero. This is a refined notion requiring some study of thermodynamics for its full understanding. For setting up an absolute temperature scale one must first assign a numerical value to one fixed temperature. For this, the triple point of water has been chosen, *i.e.*, the temperature at which solid, liquid, and gaseous water are all in equilibrium. The triple point is defined to be 273·16 K where K is read for kelvin (after Lord Kelvin). This temperature is 0·01°C on the Celsius scale (*q.v.*) and is thus very close to the melting point of ice. Suppose the pressure and volume of a mass of gas are measured (i) at the triple point of water, giving (pV)tr as the product of the pressure and volume; and (ii) at any unknown temperature T K, giving (pV) as the product. Then the absolute temperature, T K, is defined by

$$T\ \text{K} = 273{\cdot}16\,\frac{(pV)}{(pV)\text{tr}}$$

It is to be understood that the gas pressure is very low. The nature of the gas is immaterial.

More subtly, it can be shown that the temperature so defined is identical with that derived in a rather abstract way in the science of thermodynamics. The absolute scale is therefore also called the thermodynamic scale. Absolute temperatures can be obtained from Celsius temperatures by adding 273·15; thus the absolute temperature of melting ice is 273·15 K. Conversely, absolute zero is a temperature 273·15 K below the temperature of melting ice, *i.e.*, −273·15°C. Theory shows that absolute zero is unattainable, but it has been approached to within about 1 millionth of a degree. Within ten or so degrees of absolute zero, matter develops some remarkable properties. *See also* **Kelvin, Cryogenics, Superconductor, Helium.**

Acacia. The thorny tree of Africa.

Acadians. *See* **Cajuns.**

Acetic Acid, an organic acid produced when ordinary (ethyl) alcohol is fermented by the organism called *Acetobacter aceti*. The same oxidation process yields vinegar: this is a weak and crude solution of acetic acid obtained by trickling dilute alcoholic liquor over beechwood shavings at 35°C. The souring of wine is due to the same process. Acetic acid is used as a food preservative and flavouring material, and in the manufacture of cellulose acetate and white lead.

Acetylene (also called ethyne), a compound of carbon and hydrogen prepared from calcium carbide and water. A very reactive gas, it is used industrially on a large scale to prepare acetaldehyde, chlorohydrocarbon solvents, and many intermediates for plastics manufacture. Burns in air with a highly luminous flame, formerly used for lighting purposes, but is now widely used, with oxygen, in welding. For safe storage and transportation it is dissolved in acetone.

Acid Rain is the name given to rain, snow or sleet contaminated with acid substances so that its acidity is greater than the limit expected by normal concentrations of carbon dioxide dissolving in the rain to give carbonic acid (pH 5·5–5·6). The pH (*q.v.*) of acid rain therefore is less than about 5·5. The increased acidity is caused by larger concentrations of a number of contaminants, principally the strong acids, nitric and sulphuric, which arise from industrial effluents containing oxides of nitrogen and sulphur. In some European and North American areas such contamination can give a rain pH as low as 3 (which is 100 times more acid than pH 5). The acid rain can mark fruit and leaves, and adversely affect soil but its main effect is on the aquatic ecosystems especially in regions which cannot naturally buffer acidic inputs such as those with thin soils and granite rocks.

Acids, substances having a tendency to lose a positive ion (a proton). This general definition overcomes difficulties of earlier views which merely described their properties and asserted that they are chemically opposite to bases. As a whole acids contain ionisable hydrogen, replaceable by a metal, to form a salt. In-organic acids are compounds of non-metals or metalloids, *e.g.*, sulphuric, phosphoric acid. Carboxylic acids contain the group $-COOH$.

Actinaria. *See* **Sea Anemones.**

Actinides, the fourteen metallic elements from thorium (no. 90) to lawrencium (no. 103). All known isotopes of these elements are radioactive and those with atomic number greater than 92 (uranium) have been produced only in significant quantities artificially. Plutonium (no. 94) is obtained from uranium during the course of nuclear reactor operation and the higher transuranic elements can be made from it by the successive capture of neutrons or nuclei of light atoms. The availability of only minute quantities of short-lived isotopes makes the determination of the physical and chemical properties of the higher actinides very difficult. Claims for the discovery of new elements can therefore be controversial and since the discoverers can name the elements their naming is also controversial. There were three different reports for Nobelium (no. 102). Lawrencium (no. 103) is called Jolistium by Russian authors. Element no. 104 was reported in 1964 by a Russian group and called Kurchatovium but is called Rutherfordium (Rf) in the West. Element no. 105 is called Hahnium (Hn).

Advent, the period including four Sundays devoted to religious preparation for Christmas.

Advocatus Diaboli ("the devil's advocate"), a Roman Catholic functionary who presents opposing evidence in regard to the life of any deceased person it may be proposed to canonise.

Aerodynamics, the science of gases (especially air) in motion, particularly in relation to aircraft (aeronautics). The idea of imitating the birds by the use of wings is of ancient origin. Leonardo da Vinci first carried out experiments in a scientific manner. The invention of the balloon in 1783 and the researches of scientists and engineers in the 19th cent. ultimately led to the development of the aeroplane.

Aerogel. A material which is the lightest solid yet known to man.

Aerolites, the name given to the class of meteorites composed chiefly of heavy silicates. The other two main classes are *siderolites* (nickel–iron and silicates) and *siderites* (nickel–iron).

Aerosol, a suspension of a liquid in a gas; for example, a fog is very small drops of water suspended in air. Formed by spraying the liquid in air, aerosols are used to disperse liquid over a wide area in crop spraying, air freshening and pest control. *See also* **Fluorocarbons.**

Afrikander, type of cattle bred in South Africa.

Afrikaner, an Afrikaans-speaking South African, usually of Dutch descent.

After-damp occurs in a mine after an explosion, causing suffocation. It is composed mainly of carbon dioxide and nitrogen and contains water vapour and carbon monoxide.

Agaric, large fungi of the family *Agaricaceae*, which includes the mushroom and what are popularly called "toadstools", though the idea that these two lay terms sharply differentiate between edible and poisonous fungi is an incorrect one. Characteristic of the agarics is the presence of a cap or *pileus* (bearing underneath the spore-shedding gills) and a stalk or *stipe*.

Agave, the American aloe or Century Plant which sometimes does not attain to flowering maturity under sixty or seventy years, and then dies. The flower spray may reach a height of 6 m and in its development the rush of sap is so great that the Mexicans collect for brewing the strong spirit called mescal. 1,000 litres of sap can be obtained from a single plant. Some species of agave yield sisal (for making cord and rope).

Agouti. A strange jungle rodent whose teeth can open Brazil nuts.

Air, a mixture of gases in the earth's atmosphere, the main constituents being nitrogen, oxygen and argon. Dry air contains these gases in the following proportions by volume: nitrogen 78·06%, oxygen 21%, argon 0·94%. Other gases are also present in small amounts. Of particular importance are water vapour and carbon dioxide. Water vapour is not only critical for life forms on land but also a major factor in the behaviour of the atmosphere—weather and climate. Carbon dioxide is utilised by green plants in photosynthesis.

Air also contains traces of ammonia, nitrogen oxides, hydrogen, sulphur dioxide, ozone, and of the rare gases, helium, krypton, neon and xenon. Near cities and industrial areas there are also large quantities of dust and smoke particles (up to 100,000 particles per cc), and traces of other gases from industrial processes.

A litre of air at 0°C and 760 mm pressure weighs 1·2932 g. *See also* **Atmosphere, Pollution.**

Air Glow is the general name given to a large number of relatively weak optical emissions from the earth's upper atmosphere in the height range 70 to 400 km (approx.). It is distinct from the aurora polaris (*q.v.*) which is usually much brighter and normally only observable at high latitudes. Air glow is produced by a combination of photochemical reactions in the upper atmosphere, excitation by photoelectrons, or by solar ultra-violet light. In the latter case it is more correctly called "dayglow." These emissions occur in the ultra-violet and infra-red spectral regions as well as in visible light.

Alabaster, a soft crystalline form of sulphate of lime, or granulated gypsum, easily worked for statuary and other ornamental articles, and capable of being highly polished. Volterra, in Tuscany, yields the finest; that in highest ancient repute came from Alabastron in Egypt.

Alb, white priestly vestment reaching to the feet.

Albatross, a large sea-bird of almost pure white, black and white, or brown plumage. It nests in colonies on remote islands, but at other times rarely approaches land. Of the 22 species, no less than 17 are now facing extinction.

Modern long-line fishing methods are threatening the albatross with extinction (an albatross is killed every five minutes by the fishing industry).

Contrary to popular belief, it has now been discovered that the albatross does *not* wander aimlessly but for purposes of breeding and foraging. One recent survey found that some albatrosses make astonishing round-the-world journeys in as little as 46 days. The albatross has the longest wingspan of any bird. It is the greatest of all the ocean wanderers.

Albert Memorial, a large Gothic monument designed by Sir George Gilbert Scott, and embellished with sculptures by eminent artists. Erected in memory of Prince Albert in Kensington Gardens.

Alcázar. Palace of the Moorish kings at Seville, famed for the beauty of its halls and gardens.

Alcoholics Anonymous, organisation first formed to help alcoholics in the USA in 1935. The first group was formed in Britain in 1948 in London.

Alcohols. A class of organic compounds of general formula R–OH, where R is an aliphatic radical. "Alcohol" is the name used for ethyl alcohol (ethanol); this is produced by distilling fermented liquors, and synthetically from ethylene, a product of petroleum cracking. Industrially ethyl alcohol is used in the manufacture of chloroform, ether, perfumes, *etc.*

Diluted with wood alcohol or other denaturants ethyl alcohol is called "methylated spirits"; the denaturants are varied according to the industrial purposes for which it is required, the methylated spirits then being largely exempt from duty. Wood alcohol (methyl alcohol or methanol) can be obtained by distilling wood or synthetically from water gas.

Alcoholic Strength. In 1980 Great Britain adopted the OIML (International Organisation of Legal Metrology) system of spirit strength measurement in metric units as required by EEC directive. The alcoholic strength of wine is expressed in percentage volume ("% vol") terms, *i.e.*, the number of volumes of pure alcohol in 100 volumes of the product at 20°C. For spirits the quantity for duty is the litre of alcohol at 20°C. For example, a case of 12 bottles of 75 cl each = 9 litres; at 40% volume 9 litres = 9 × 40% = 3.60 litres of alcohol. The alcoholic strength of spirits and liqueurs appearing on bottle labels is increasingly shown in % vol. terms (*e.g.*, "40.5% vol").

The USA continues to use the US proof gallon (1·37 US proof gallons = 1 British proof gallon).

Aldebaran. A giant orange star that has inflated to 45 times the diameter of our Sun.

Aldehyde, the generic term for a class of chemical compounds of general formula R–CHO, where R is an organic radical. Except for formaldehyde, which is a gas, aldehydes are volatile liquids. They are produced by oxidation of primary alcohols. Most important aldehyde is formaldehyde (methanal) used in making the plastics described as formaldehyde resins. Formalin (formaldehyde solution in water) is much used for preserving zoological specimens.

Alder, a river-side tree of the genus *Alnus*, including some 30 species and found in north temperate regions and the Andes. The only species native to Britain is *A. glutinosa*, which has been described as "guardian of river-banks" because of the way its roots bind together the sand and stones, and so slow down erosion. The wood is used for furniture and charcoal.

Aldine Editions are the beautiful books printed in Venice by the Renaissance printer Aldo Pio Manuzio and his family between 1490 and 1597. Italics were first introduced in these books.

Algae, flowerless plants living mostly in water. Seaweeds and the green pond scums are the best known algae. The green powder found on trees is a microscopic alga (*Protoccus*). Microalgae have potential to be a new-energy source.

Algebra, a branch of mathematics in which symbols are used in place of numbers. Sir Isaac Newton styled it the "universal arithmetic". The Chinese were able to solve the quadratic equation before the Christian era but it was Al-Khowarizmi, an Arab mathematician of the early 9th cent., who introduced algebra to Europe.

Alhambra, the ancient palace of the Moorish kings at Granada in Spain, built in the 13th and 14th cent. Though part of the castle was turned into a modern palace under Charles V, the most beautiful parts of the interior are still preserved—the graceful halls and dwelling-rooms grouped round the Court of Alberca and the Court of Lions, with their fountains, arcades, and lovely gardens.

Aliphatic describes derivatives of hydrocarbons having chains of carbon atoms, as distinct from rings of carbon atoms as in benzene (*see* **Aromatic**). The gas butane is aliphatic.

Alkali, the general name given to a number of chemicals which are bases (*q.v.*). The term should be limited to the hydroxides of metals in the first and second group of the periodic table and of ammonia, *e.g.*, NaOH, KOH. They are used commercially in the manufacture of paper, glass, soap, and artificial silk. The word comes from the Arabic *al-kali* meaning calcined wood ashes. Alkalis are very soluble in water and neutralise acids to form salts and water.

Alkaloids, a large group of natural products which contain nitrogen; they are usually basic. Isolated from plants and animals, they include some hormones, vitamins, and drugs. Examples are nicotine, adrenalin, and cocaine. Many alkaloids are made synthetically for medicinal use, *e.g.*, morphine, quinine. Their function in plants is not well understood. *See* **Belladonna**.

Alligator, the crocodile of America, found in the lower Mississippi and adjacent lakes *etc.* There is also a Chinese species. Alligators have broader snouts than other crocodiles. Male alligators emit low frequency growls to attract females.

Allotropy. Depending on the temperature, pressure or method of preparation, an element may exist in one of several forms, each having different physical properties (crystal structure, electrical conductivity, melting point, *etc.*). This is known as allotropy and the different forms of the element are called allotropes. Many elements exhibit allotropy, *e.g.*, sulphur, phosphorus, oxygen, tin and carbon, the most well-known allotropes of carbon being diamond and graphite.

Alloys are combinations of metals made for their valuable special properties, *e.g.*, durability, strength, lightness, magnetism, rust-resistance, *etc.* Some well-known ones are brass (zinc + copper), coinage bronze (copper + zinc + tin), steels (iron + carbon + various other materials), soft solder (tin + lead), dental fillings (mercury + various ingredients).

All Saints' Day (1 Nov) is common to both the Anglican and Roman Catholic Churches, and is in commemoration of the saints generally, or such as have no special day set apart for them. Instituted by Pope Gregory IV in A.D. 835. It was formerly called "All Hallows".

All Souls' Day (2 Nov) is a festival of the Roman Catholic Church, intended for the mitigation by prayer of the sufferings of souls in purgatory. The commemoration was enjoined by Abbot Odilo of Cluny during the 11th cent. upon the monastic order over which he presided, and was afterwards adopted generally in the Roman Communion.

Allspice, a flavouring obtained from a West Indian tree of the myrtle family, *Pimenta officinalis*, likened to the flavour of cinnamon, nutmeg and cloves combined. The berries resemble peppercorns and are used as a spice in mincemeat, etc.

Alluvium, river transported deposits of sand, mud and gravel which accumulate to form distinctive features such as levées, flood plains and deltas. The frequent renewal of alluvium by flooding causes riverine lands to be some of the most fertile. In Asia alluvial lands support high densities of population, *e.g.*, The Hwang-ho plains and the Ganges delta.

Almond, the fruit of the *Amygdalus communis*, originally indigenous to Persia, Asia Minor and N. Africa; now cultivated in Italy, Spain, France, the USA and Australia. It yields both bitter and sweet oil. Bitter almond oil is obtained by macerating and distilling the ripe seeds; it is used for flavouring and scenting purposes, its fragrant odour being due to the presence of benzaldehyde and hydrogen cyanide.

When the seeds are pressed sweet almond oil results: this is used in perfumery, and also as a lubricant for very delicate machinery.

Almuce, a fur stole worn by certain canons.

Aloe, large plants of the lily family, with about 180 species found mainly in the S. African veldt and karroo. The bitter purgative drug (aloes) is prepared by evaporating the plant's sap. *See* **Agave.**

Alpaca, a South American ruminant related to the llama whose long, fine wool is woven into a soft dress fabric known by the same name. Sir Titus Salt first manufactured alpaca cloth (1836).

Until three decades ago, all the world's alpacas were to be found in Peru. Their wool is so soft it was worn by Inca rulers and is still in great demand today.

Alpha Particle, or Alpha-ray, fast-moving helium nucleus ejected by some radioactive atoms, *e.g.*, polonium. It is a combination of 2 neutrons and 2 protons.

Alphabet (so called from the first two letters of the Greek alphabet—alpha, beta) is the term applied to the collection of letters from which the words of a language are made up. It grew out of the knowledge that all words can be expressed by a limited number of sounds arranged in various combinations. The Phoenicians were the first to make use of an alphabetic script derived from an earlier Semitic alphabet (earliest known inscriptions *c.* 1500–950 B.C.) from which all other alphabets have sprung. The stages in the development of the alphabet were mnemonic (memory aids), pictorial (actual pictures), ideographic (symbols), and lastly phonetic. All the ideographic systems died out, with the exception of that of the Chinese.*See also* **Greek Alphabet, G9**.

Altimeter, an instrument used in aircraft to estimate altitude; its usual essential feature is an aneroid barometer which registers the decrease of pressure with height. Roughly 1 millibar corresponds to 9 m. To read an aircraft altimeter correct for its destination, the zero setting must be adjusted for difference of ground height and difference of surface pressure, especially when pressure is falling or when flying towards low pressure.

Altitude, an astronomical term used to signify the angular elevation of a heavenly body; this is measured with a quadrant or sextant. In aeronautics it is the height above sea-level.

Alum is a compound salt used in various industrial processes, especially dyeing, its constituents being the sulphate of one univalent metal or radical (*e.g.*, potassium, sodium, ammonium, rubidium, caesium, silver, thallium) and the sulphate of a tervalent metal (*e.g.*, aluminium, iron, chromium, manganese), and water of crystallisation.

William Pochin (1794–1850) developed the synthetic process which made alum cake (alum does not occur naturally in England).

Alumina is the oxide of aluminium. Very valuable as a refractory material. The ruby is almost 100 per cent. alumina; so also are the emerald, oriental amethyst, etc. An hydrated aluminium oxide is bauxite, chief ore of aluminium from which the metal is extracted electrolytically.

Aluminium, element no. 13, symbol Al, is a light metal which conducts electricity well. Its specific gravity at 20°C is 2·705. Melting point of aluminium is 660·2°C. It is made commercially by electrolysing bauxite dissolved in cryolite (double fluoride of aluminium and sodium). Aluminium alloys are being increasingly used for construction purposes.

Amadavat, a popular cage bird of the weaver family, mainly crimson with spots, so named because the first specimens came from Ahmadabad in India about 1700.

Amalgam is the term applied to any alloy of which mercury forms a part.

Amber, a brittle resinous substance; in origin, fossilised resin. Obtained mostly from the Baltic coasts, and used for ornaments *etc*.

Ambergris is a waxy substance produced in the intestines of the sperm whale, and generally found floating on the sea. It is a valuable perfumery material.

Amblyopsis, a species of fish, practically sightless, and with inoperative organs of hearing and feeling, that inhabit the Mammoth Cave of Kentucky. A remarkable illustration of the failure of senses not brought into use.

Amethyst, the violet variety of quartz, used as a precious stone, containing traces of manganese, titanium and iron. The finest coloured specimens come from Brazil and the Urals.

Amice, a white linen vestment worn by Roman Catholic and many Anglican priests when officiating at Mass or Holy Eucharist.

Amines, organic chemicals composed of carbon, hydrogen and nitrogen. They are derived from ammonia, which they resemble in smell and chemical characteristics. The smell of bad fish is due to the presence of amines. Important industrially as intermediates in a wide variety of products, for example, the synthesis of dyestuffs and man-made fibres such as nylon.

Amino acids, organic compounds containing an amine group and a carboxylic acid group. They are the "building bricks" of proteins (*q.v.*).

Ammeter, an instrument for measuring the current flowing in an electric circuit. A contraction of ampere-meter. *See* **Ampere.**

Ammonia, a colourless gaseous compound comprising three atoms of hydrogen to one of nitrogen. Formerly it was made by heating the horns and hoofs of deer, acquiring the name of spirits of hartshorn. The ammonia of commerce is now procured by coal decomposition in the course of gas-making and by direct synthesis. In the very important Haber process of ammonia production by fixation of atmospheric nitrogen, the nitrogen is made to combine with hydrogen and the ammonia so prepared is converted into nitric acid, ammonium nitrate or ammonium sulphate. The Haber process made Germany self-sufficient in nitrates in the first world war. Anhydrous ammonia is ammonia in liquid or gas form – a commonly used fertiliser. Ammonia itself could become the clean fuel of the future.

Ammonites, extinct animals related to the Nautilus. The chambered shell is coiled, usually in a plane spiral. They are confined to Mesozoic rocks. They were once one of the most prolific species on the planet. Named after the Egyptian god Ammon.

Ammonium, the basic radical of ammonium salts, Composed of one atom of nitrogen and four of hydrogen, it behaves chemically like an ion of a monovalent alkali metal. Ammonium chloride is known as "sal ammoniac". "Sal volatile" is ammonium carbonate.

Amnesty, an act of grace by which a ruler or governing power pardons political offenders.

Amnesty International is the world's largest human rights organisation. It seeks to secure the release of prisoners of conscience, works for fair and prompt trials for all political prisoners, and campaigns against torture and the death penalty.

Since 1961, Amnesty has taken on many thousands of cases. There are now well over 4½ million members in local groups spread across almost all the countries of the world. The equivalent US organisation is Human Rights Watch.

Amorphous, a term used to indicate the absence of crystalline form in any body or substance.

Ampere, unit of electric current in the SI system of units; named after André Marie Ampère, who in the 1820s helped to lay the foundations of modern electromagnetism. Defined as that constant current which, if maintained in two parallel rectilinear conductors of infinite length, of negligible circular cross section, and placed at a distance of one metre apart in a vacuum, would produce between these conductors a force equal to 2×10^{-7} newton per metre. *See* **T59**.

Amphioxus *or* **Lancelet,** a primitive chordate (*q.v.*), occurring in sand-banks.

Anabolism. *See* **Catabolism.**

Analysis is one of the major branches of mathematics and includes the theories of differentiation, integration, differential equations etc.

Anchor, an instrument used for keeping ships stationary. Great improvements have been introduced in recent years, stockless anchors being now chiefly used, consisting of a shank and a loose fluke. Lloyd's rules prescribe the number and weight of anchors which must be carried by merchant ships.

Anchorite is a religious person who retires into solitude to employ himself with holy thoughts. Among the early Christians, anchorites were numerous, but in the Western Church they have been few. Their reputation for wisdom and prescience was high, and kings and rulers in olden days would visit their cells for counsel.

An anchorite or "ankret" was in medieval times a source of fame and often much profit to the monastic house within which he was voluntarily immured.

Anchovy, a fish of the herring family, distinguished by its large mouth and projecting snout, once plentiful in the Mediterranean. Stocks are recovering due to climate change and decline in predators.

Ancient Lights are rights of light enjoyed by a property owner over adjoining land. Such a right is obtained either by uninterrupted enjoyment for twenty years, or by written authority, and once legally established cannot be upset, no building being permissible that would seriously interfere with the privilege.

Anemometer, an instrument for measuring the strength of the wind. In the most widely used pattern the rotation, about a vertical axis, of a group of hemispherical or conical cups gives a measure of the total flow of air past the cups, various registering devices being employed.

The Dines anemograph provides a continuous record of the variation in both velocity and direction; changes of pressure produced in a horizontal tube, kept pointing into the wind by a vane, cause a float, to which a pen is attached, to rise and fall in sympathy with the gusts and lulls.

The hot-wire anemometer, depending upon the change of electrical resistance experienced by a heated wire when cooled, enables very gentle air currents to be investigated.

Aneroid is the kind of barometer which does not depend upon atmospheric support of a mercury (or other liquid) column. It consists of a metallic box, partially exhausted of air, with a corrugated lid which moves with atmospheric changes. A lever system magnifies the lid movements about 200 times and atmospheric pressure is read from a dial. The construction of the vacuum chamber provides automatic compensation for temperature changes. An aneroid barometer is the basic component of an altimeter.

Angelica, an aromatic plant of the Umbelliferae order, *Angelica officinalis*, valuable as a flavouring and possessing medical properties. Once supposed to protect against poison.

Angelus, a church bell rung in Roman Catholic countries, at morn, noon, and sunset, to remind the faithful to say their Angelic Salutation.

Angles, a northern tribe originally settled in Schleswig, who with the Saxons and Jutes invaded Britain in the 5th cent.

Ångström, a unit of length equal to 10^{-10} metres. It is used by astronomers to specify the wavelength of light and ultraviolet radiation. Named after the Swedish physicist A. J. Ångström (1814–74).

Aniline, a simple aromatic compound ($C_6H_5NH_2$) related to benzene and ammonia. It is obtained from coal-tar. The name recalls the fact that it was first prepared by distilling indigo (*anil* is Portuguese for indigo). In 1856 W. H. Perkin (1838–1907) discovered the first aniline or coal-tar dye, mauve, and thus founded the modern dyestuff industry.

Animal Kingdom. *See* **Section T.**

Anise, an umbelliferous plant (*Pimpinella anisum*) found in Egypt and the Levant, and valued for its fruit, aniseed, possessing certain medicinal properties and yielding an aromatic, volatile oil. Also used in cooking. The anise of the Bible is *Anethum graveolens, i.e.*, dill.

Anointing is the pouring of consecrated oil upon the body as a mark of supreme honour. In England it is restricted chiefly to the ceremony of the monarch's coronation, and the spoon with which the oil is applied forms part of the English regalia. In the Roman Catholic Church anointing represents the sacrament of extreme unction.

Ant. There are over 6,000 species of ants, which belong to the same order (Hymenoptera) as the bees, wasps and ichneumon flies. They are social in habit, living in communities of varying size and development. There are three basic castes in ants—the females or *queens*, the *males*, and the *workers* (the last-named being neuter), although specialised forms of workers are sometimes found, *e.g.*, the *soldiers* of the harvesting ants. In the communities of those species of ants which evolved most recently there is a highly complex social life and well-developed division of labour. Some species of these ants make slaves of other species, stealing the cocoons before the adult forms emerge.

Many ants "milk" green-flies, which they protect for their honey-like secretion, and most ants' nests contain many "guests", such as beetles and silver fish. Some ants harvest grains of corn, and others, from S. America, live on fungi which they cultivate in underground "mushroom beds". Ants have lived on the Earth for more than 100 million years.

Antarctic Exploration. In earlier centuries it was thought that a great continent must exist in the southern hemisphere, around the South Pole, to balance the known land masses in the north. Its supposed extent was greatly reduced in the 18th cent., particularly when Capt. Cook sailed for the first time south of the Antarctic Circle, reaching the edge of the ice-pack.

A portion of the ice-covered continent—the coast of Graham Land—was first sighted by Lieut. Edward Bransfield in 1820. The first extensive exploration was made by Capt. James Clarke Ross, who with the *Erebus* and *Terror* penetrated into the Ross Sea in 1841, and discovered the Ross Ice Barrier in 78° South lat.

The Norwegian, C. E. Borchgrevink, in 1898 1900, was the first to winter in the Antarctic and to travel on the ice barrier. The British share in this work was carried out by Capt. R. F. Scott's expedition in the *Discovery*, 1901–4. Scott's party sledged across the barrier to 82° 17′ South, then a record "farthest south". A little later, Ernest Shackleton beat this by travelling to within 160 km of the South Pole. The Scottish polar explorer William Spiers Bruce led the Scottish national Antarctic Expedition of 1902 in the *Scotia* and discovered Coats Land and founded an observatory on the South Orkneys.

In 1910 Captain Scott organised his second expedition in *Terra Nova*, and became engaged against his will in a "race for the Pole" when, after his departure, the Norwegian Arctic explorer, Roald Amundsen, suddenly announced that he was sailing for the Antarctic. Amundsen set up his base at the eastern end of the Barrier, and, relying on dog teams for hauling his sledges, reached the Pole on 14 December 1911.

Meanwhile Scott and his party, their start delayed by adverse weather, were marching southwards, man-hauling their sledges, for Scott was against the use of dogs. After an arduous journey they reached the Pole one month after Amundsen. The return was a struggle against the weather and fatigue, until at last they perished within a few kilometres of their base.

After the first world war the development of the whaling industry greatly stimulated further exploration. Outstanding expeditions included that of Admiral R. E. Byrd, 1929, when he flew over the South Pole; the British Graham Land expedition, 1934, which carried out the first extensive mapping of any part of the Antarctic continent; and the US Navy's Antarctic Expedition of 1940, when the whole continent was circumnavigated.

Some years later, the Antarctic was the scene of much activity during the International Geophysical Year (1957–58). The Commonwealth Trans-Antarctic Expedition set out from opposite sides of the continent and met at the South Pole, the UK party, led by Sir Vivian Fuchs, from the Falklands, and Sir Edmund Hillary and his party from New Zealand. The UK party accomplished the first crossing of the White Continent in 99 days. In 1993, the explorers Sir Ranulph Fiennes and Dr Michael Stroud completed the first unsupported crossing of the Antarctic land mass and the longest unsupported polar journey both world records. In December 1994, Liv Arnesen (Norway) became the first woman to reach the South Pole alone.

Scientists now working in Antarctica have discovered that around 190,000,000 years ago the frozen waste was once a huge forest roamed by plant-eating dinosaurs. Meanwhile climate warming is now melting the Antarctic ice at a faster rate than at any time in the last 1,000 years (much faster than previously thought). In 2016 scientists discovered an enormous "Grand Canyon" much larger than the American Grand Canyon. Lake Vostok has revealed unknown bacterial life forms. Primitive microbes (*archaea*) have been found in Lake Whillans.

Although Antarctica is home to penguins, whales, seals and numerous birds there are no polar bears. Jellyfish are likely to replace penguins as the dominant species. Thriving ecosystems of clams and bacteria have now been discovered deep below the surface. Since light does not penetrate the organisms do not photosynthesise but use methane to make energy.

The temperature on the polar plateau is −60°C for half the year. The lowest recorded temperature is −93·2°C (in August 2010). Antarctica is the coldest, most isolated and hostile place on earth.

Scientists estimate that its vast ice sheets contain *c.* 90 % of the world's known fresh water.

Fascination with the wilderness of Antarctica—the last wilderness on the planet—is resulting in a growth of tourism to see the Gentoo penguins *etc.*

Anteaters, a small family (the Myrmecophagidae) of mammals from Central and South America. They feed on ants, termites and other insects which they gather with a long tongue covered with sticky saliva. The anteater is the only mammal without teeth.

Antelope, a variety of hoofed mammal, including gazelles, pronghorns *etc.* They are mainly to be found in Africa. The rare Saiga antelope, found in Mongolia and Russia, is critically endangered. Rarest of all is the hirola of Kenya. The pronghorn is the fastest of all antelopes–it can outrun a cheetah.

Antennae are paired feelers of insects and crustaceans, In radio, the term "antenna" is the equivalent to "aerial".

Anthem, A musical setting of a religious text (biblical or otherwise) in English, for choir with or without instrumental accompaniment. A "full" anthem is choral throughout: a "verse" anthem includes solo voice(s). The genre flourished in the Reformation and early Stuart periods (Tallis, Byrd, Tomkins) and after the Restoration (Locke, Humfrey, Purcell). Later composers of anthems include S.S. Wesley, Stainer, Stanford, Howells and Leighton.

Anthracite is a black coal with a brilliant lustre. It contains 92 per cent. and over of carbon and burns slowly, without smoke or flame. *See* **Coal.**

Anthropocene Epoch. A term which renames the current geological epoch to reflect the impact of humans. The term is particularly used of the atomic age which began in 1945. The Dutch Nobel Laureate Paul Crutzen popularised the term in 2000.

Anthropoid, meaning "resembling man", a sub-order of the primate mammals including man and also the gibbon, chimpanzee, orang-utan, and gorilla.

Anticyclone, a region where barometric pressure is greater than that of its surroundings. Such a system is distinguished on weather charts by a pattern of isobars, usually circular or oval-shaped, enclosing the centre of high pressure where the air is calm. In the remaining areas light or moderately strong winds blow spirally outwards in a clockwise direction in the Northern Hemisphere (and in the reverse direction in the Southern Hemisphere), in accordance with Buys Ballot's law (an observer with back to wind in Northern Hemisphere has lower pressure to left; in Southern to right). Over the British Isles anticyclonic weather is generally quiet and settled, being fair, warm, and sunny in summer and either very cold and often foggy or overcast and gloomy in winter. These systems move slowly and sometimes remain practically stationary for days at a time, that over Siberia being particularly well defined.

Extensive belts of almost permanent anticyclones occur in latitudes 30° N and 30° S. Persistent anticyclonic weather with easterly winds brings our coldest weather.

Antikythera Mechanism. An ancient Greek calculator, rescued from the seabed, which predicted astronomical phenomenon such as solar eclipses (and also dates of the Olympics) with remarkable accuracy. It dates from the 2nd cent. B.C.

Antimony. Metal element, no. 51, symbol Sb. In group 5 of the periodic table. Exists in various forms, the stable form being a grey metal with a layer structure. The other forms are non-conductors. On being burned, it gives off dense fumes of oxide of antimony. By itself it is not of special utility; but as an alloy for hardening other metals, it is much used. As an alloy with lead for type-metal, and with tin and copper or zinc for Britannia-metal, it is of great value. Most important antimony ore is stibnite (antimony sulphide).

Anti-Pope, one elected in opposition to one held to be canonically chosen; applied to the popes Clement VII and Benedict XIII, who resided at Avignon during the Great Schism (1378–1417).

Anti-Proton, the "negative proton", an atomic particle created in high energy collisions of nuclear particles. *See* **Section T.**

Antlers are the branched horns of deer, the branches being called tines. Antlers originate as outgrowths of the frontal bone, and are usually shed once a year. Except in the reindeer and caribou they are restricted to the male.

Antonine Wall. *See* **Roman Walls.**

Aotearoa, meaning "Long White Cloud", the Maori name for New Zealand.

Ape, a term applied to the gorilla, chimpanzee, orang-utan and gibbon—the anthropoid apes.

Aphelion, the point in the orbit of a planet farthest from the sun; the opposite of perihelion. At aphelion the earth is $1{\cdot}52 \times 10^8$ km from the sun.

Aphids, green-flies or plant lice, a numerous species of destructive insects living on young shoots and foliage, some on roots. Reproduction is by *parthenogenesis* (virgin birth). The process means females can become pregnant even before they are born.

Apis, the sacred bull worshipped by the ancient Egyptians; also the scientific name for the bee.

Apogee, that point in the orbit of a heavenly body which is farthest from the earth; used in relation to the sun, moon and artificial satellites. The sun's apogee corresponds to the earth's aphelion. *See* **Perigee.**

Apostasy is a revolt, by an individual or party, from one form of opinions or doctrinate to another. Julian, the Roman Emperor (331–63), brought up as a Christian, became converted to paganism and on coming to the throne (361), proclaimed religious toleration. Hence his name, Julian the Apostate.

Apostles' Creed, the name of the most ancient of the Church's statements of its belief: "I believe in God the Father Almighty; and in Jesus Christ his only Son our Lord, who was born of the Holy Ghost and the Virgin Mary."

A later version is used in the Church of England at morning and evening prayer.

Appian Way, the oldest and finest of the Roman roads originally laid by Appius Claudius (312 B.C.) from Rome to Capua and thence to Brundisium (Brindisi).

Approved Schools were residential schools, subject to Home Office inspection, for the training of young persons under 17 who were guilty of offences or in need of care and protection and had been sent to them by magistrates from juvenile or other courts. The approved school order was abolished by the Children and Young Persons Act 1969. *See* **Young Offenders' Institutions.**

April, the fourth month of the year, from the Roman *Aprilis* derived from *aperire* "to open" —the period when the buds begin to open.

Apse is a semicircular recess, arched or dome-roofed, at the end of the choir, aisles, or nave of a church.

Aquaculture, or fish-farming, is the fastest-growing sector of the world food economy. Half of all fish consumed by humans comes from aqua-culture now.

Aqueducts are conduits in which water flows or is conveyed from its source to the place where it is to be used. Most famous builders were the Romans and the oldest Roman aqueduct was the Aqua Appia, which dates from about 310 B.C. Among modern aqueducts may be mentioned that of Glasgow, which brings water to that city from Loch Katrine; that of Manchester, which taps Thirlmere; that of Liverpool, with Lake Vyrnwy in North Wales as its source, and the Fron Aqueduct, Powys, which carries water to the Birmingham area. The Pontcysylte aqueduct in Clwyd (the longest and highest in the UK) is now a world heritage site. Massive modern aqueducts have been constructed in China.

Arabian Nights Entertainment or the **Book of a Thousand and One Nights,** a collection of fascinating tales of the Orient, of mixed Indian, Persian, Arabic, and Egyptian origination, and first made known in Europe by Antoine Galland's French translation (1704-17) from Arabian texts. The "master" tale tells how the princess Shahrazad so beguiles the king by telling of the tales over one thousand and one nights that her life was spared.

English translators include E. W. Lane (1840), Sir Richard Burton (1885–8), and John Payne (1882-4).

Arabic Numerals. The modern system of numbering, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, in which the digits depend on their position for their value is called the Arabic numerical notation. The method is, in fact, of Indian origin. By the 9th cent. Hindu science was available in Arabic, and the Persian mathematician Al-Kwarizimi (*c.* 830) in his *Arithmetic* used the so-called "Arabic" system of numbering. Gradually the method spread to Europe, taking the place of the Roman system which was useless for calculation.

The West is indebted to the Arabs for the zero symbol. It made the invention of decimal fractions possible.

Aragonite, the unstable form of calcium carbonate found as a mineral in some young deposits. It crystallises in the orthorhombic system but tends to revert to calcite.

Archaeopteryx, a fossil bird providing a connecting link between reptiles and birds. It had feathers, jaws with teeth, no bill, reptilian bones and skull, a long tail, and it probably used its fore-limbs for gliding flight. The first specimen, found in 1861, in the Solenhofen limestone of Bavaria, is in London's Natural History Museum. It is *c.* 147 million years old.

Archbishop, the chief of the bishops of an ecclesiastical province in the Orthodox, Roman Catholic, and Anglican churches. In the Church of England there are two archbishops, the Archbishop of Canterbury, called the Primate of *all* England, and the Archbishop of York, styled the Primate of England. *See also* **G11.**

Archimedes' Principle. When a body is weighed in air and then in any fluid, the apparent loss in weight is equal to the weight of fluid displaced. This scientific fact was noted by the Syracusan philosopher Archimedes (287–212 B.C.) and is used as a basis for density measurements.

Arctic Exploration. Modern exploration of the Arctic began in the 16th century when sailors sought to reach the East Indies by passing through the Arctic to the Pacific Ocean.

The North-east Passage, via the shores of northern Asia, was the first attempted. In 1553 and 1554 the English navigators Sir Richard Chancellor and Stephen Burrough sailed into the White Sea, but were prevented by storms and ice from advancing farther eastwards. The project was later revived by the Dutch; Barendts in 1594 discovered Spitsbergen, but failed to get beyond Novaya Zemlya. It was not until 1879 that the Swedish geologist, A. E. Nordenskjöld, in the *Vega*, reached the Pacific.

The attempts to find a North-west Passage were more numerous and determined. In 1585 John Davis penetrated Davis Strait and coasted along Baffin Island. Hopes ran high when Henry Hudson discovered Hudson Bay in 1610, but a practicable passage continued to elude explorers. The problem was to find a navigable route through the maze of channels in the short summer season, and to avoid being frozen in with supplies exhausted. After the Napoleonic Wars the Admiralty sent out many naval expeditions which culminated in Sir John Franklin's expedition with the *Erebus* and *Terror* in 1845. The ships were beset by ice in Victoria Channel and, after Franklin's death, were abandoned by their crews, who perished from scurvy and starvation on their march southwards. To ascertain their fate, several further expeditions were despatched, and the crew of the *Investigator*, commanded by R. J. M'Clure, sailing eastwards from Bering Strait, were the first to make the Passage, though they were obliged to abandon their ship.

It was to be thirty years before the Norwegian, Roald Amundsen, succeeded in sailing the *Gjoa* from the east to west. In the meantime, the North Pole had become the goal of explorers. Nansen, in 1893, put the *Fram* into the ice-pack to drift across the Polar basin, and himself made an unsuccessful attempt on the Pole across the pack. This was eventually achieved by the American explorer Robert E. Peary, who after several expeditions in the North Greenland region, sledged to the Pole with Eskimo companions in 1909.

The next phase was the employment of airships. In 1926 Admiral Byrd made the first flight over the Pole, and in the same year Amundsen and Lincoln Ellsworth flew the airship *Norge* from Spitsbergern to Point Barrow Alaska. Two years later, the *Italia*, commanded by the Italian, Nobile, was wrecked on a return flight from the Pole, and Amundsen lost his life in an attempt to rescue the survivors. Wally Herbert, the explorer who completed the first surface crossing of the Arctic Ocean in 1969 was knighted in 2000. The first voyage under the North Pole was made in 1958 by the American nuclear-powered submarine *Nautilus*.

Scientists are currently reporting that the North Pole icecap itself is today melting faster than previously thought, thus threatening many Arctic species. In time this will allow the economic exploitation of this unexplored region.

Evidence recently uncovered shows that humans inhabited the Arctic 40,000 years ago.

Environmentalists are striving to prevent oil drilling in the Arctic, where a fifth of the word's undiscovered oil and gas is believed to be. They maintain that drilling, even with new technology, will do great damage.

Global warming may even cause the Arctic to vanish by *c.* 2080, with summers seeing the melting of the Arctic ice-cap. The Ward Hunt ice shelf (the largest in the Arctic) is already breaking up. In 2016 the area of the Arctic covered by ice dropped to a record low.

In 2007 Russian explorers planted their national flag on the seabed under the North Pole. Other countries (*e.g.* Denmark and Canada) have claims on the potential of the Arctic. *See also* **North-East Passage** and **North-West Passage.**

Arenaceous Rocks, the rocks composed of grains of sand, chiefly sandstones; quartz is the most abundant mineral in these rocks.

Argali, the Mongolian mountain sheep, the biggest sheep in the world.

Argillaceous Rocks are a sedimentary group, including the shales and clays.

Argon, chemical element no. 18, symbol A. This was the first of the inert gases (*q.v.*) to be isolated from air by Rayleigh and Ramsay in 1894. Argon is used for filling gas-filled metal filament electric lamps. In gas discharge tube it gives a blue glow. *See also* **Rare Gases.**

Arithmetic, the branch of mathematics that deals with numerical calculations as in counting, measuring, weighing. The early civilisations used simple arithmetic for commercial pur-poses, employing symbols and later letters of the alphabet as numerals.

When Hindu-Arabic numerals replaced Roman numerals in the Middle Ages it meant a great step forward and led to many rapid developments—logarithms, slide-rule, calculating machines.

Arithmetic Progression, a sequence of numbers in which the successor of each number is obtained by adding or subtracting a fixed number, for example 2, 5, 8, 11, . . . or 100, 95, 90, 85. . . .

Armadillo, a genus of animals related to the sloths and anteaters, belonging to South America, and carrying a hard bony covering over the back, under which one species (*Tolypeutes*) can completely conceal itself when attacked, rolling itself up like a hedgehog. The Brazilian three-banded armadillo (the mascot for the 2014 World Cup) is under threat. Some armadillos carry the leprosy disease. They can be found as far north as Nebraska and Wisconsin.

Armageddon, according to the Revelation of St. John, the great battle in which the last conflict between good and evil is to be fought.

Armed Forces Day was first held in Britain on 27 June 2009 to honour our armed forces.

Armillary Sphere, an early form of astronomical apparatus with a number of circles representing equator, meridian, ecliptic, *etc.* Used by Hipparchus and Ptolemy and up to the time of Tycho Brahe for determining the position of the stars.

Armistice Day, the day (11 Nov 1918) when the First World War ended is now commemorated each year with a 2-minute silence on Remembrance Sunday.

Aromatic. A term used by chemists, originally to describe compounds like benzene, having a characteristic smell. It is a term which implies a collection of chemical characteristics, the salient features being a flat ring structure and a general similarity to benzene.

Arsenic, a metalloid element, no. 33, symbol As in group 5 of the periodic table usually met with as a constituent of other minerals, sometimes by itself. Its compounds are very poisonous. Lead arsenate is a powerful insecticide used for spraying fruit trees. The more stable allotropic form (grey) has a layer structure, and conducts electricity. Curiously, arsenic trioxide can help fight many cancers.

Artesian Wells take their name from Artois in France, where the first wells of this kind were constructed in 1126. They are to be found only when a water-bearing bed is sandwiched between two impervious beds. When a boring is made to the lower part of the bed, the pressure of water is sufficient to cause the water to overflow at the surface. Artesian wells were known to ancient Egypt and China, and have existed in the Sahara since the earliest times. The fountains in Trafalgar Square were once fed by artesian wells sunk through the London clay into the chalk about 250 m.

Articles. The *Six Articles* are those contained in an Act of Henry VIII, and were of Roman Catholic origin. The *Thirty-nine Articles* were drawn up for the English church at the Reformation. They are printed at the back of the Prayer Book. Candidates for holy orders in the Church of England are required to subscribe to them.

Arum, a genus of plants of the *Araceae* family of which there is but one British species, the wake-robin or cuckoo-pint, sometimes also styled "Lords and Ladies".

Arundel Marbles, a collection of ancient Greek sculptures formed by Thomas Howard, Earl of Arundel in the 17th cent. and presented to Oxford University by his grandson, Henry Howard, who became Duke of Norfolk.

Aryans, nomadic peoples who made their way in successive waves from the Eurasian steppes to the Indus and the Nile during the first half of the 2nd millennium B.C. They crossed the Hindu Kush into N.W. India and settled in the valleys of the Indus and Ganges, where an earlier Indus civilisation had flourished, *c.* 3240–2750 B.C. Their religious ideas are reflected in the Veda (oldest Hindu scriptures, written down many centuries later in Vedic, parent language of Sanskrit). Those who made their way to Syria and Egypt founded the Hyksos empire (*c.* 1720–1550 B.C.).

The Aryans introduced the horse-drawn chariot and spoke a language from which the great Indo-European family of languages is derived, with one group in India and Iran, and another in Europe. Because of the Nazi misuse of the term, Aryan is now referred to as proto-Indo-European. *See also* **Indo-European Languages.**

Asafoetida, an acrid, strong-smelling gum resin exuded from the stem of umbelliferous plant, *Ferula foetida*, found in Iran and Afghanistan. Formerly used medicinally to treat hysteria; still used in cooking in such countries as India.

Ascension Day, or Holy Thursday, is the 40th day after Easter.

Ascot Races are an annual fashionable function dating from 1711 and taking place on Ascot Heath, only 10 km from Windsor, in June. These races have always had royal patronage. The course is *c.* 3 km long.

Ash, a familiar deciduous tree of the genus *Fraxinus*, of over 60 species, native to North temperate regions. The ash held an important place in Norse mythology, as it was supposed to support the heavens with its roots in Hell. The species native to Britain, and also to Europe, is *F. excelsior*, a tall tree with compound leaves, greenish flowers, winged seeds, and black buds in winter. It is a valuable timber tree, tough and elastic, and much used for wheels and handles.

The rowan, or mountain ash, *Sorbus aucuparia*, with similar leaves and orange berries, belongs to a different family. *F. pendula* or weeping ash is a strain which makes an ideal natural summer house. The fungal disease *Chalara fraxinea*, first discovered in Denmark in 2003, spread to Britain in 2012. This ash dieback seems unstoppable. There is currently no known treatment and all across Europe the ash tree could die out completely.

Ashes, The, the symbol which distinguishes the winning cricket team in the Australian Test Matches. In 1882 the Australians won at the Oval by 7 runs. After the match the following epitaph appeared in the *Sporting Times*: "In affectionate remembrance of English Cricket which died at the Oval on 29 Aug. 1882, deeply lamented by a large circle of sorrowing friends and acquaintances. R.I.P. NB. The body will be cremated and the ashes taken to Australia." When the English Eleven went to Australia the same winter it was said that they had come to recover the "ashes". England won two out of three matches, and after the third match the ashes of what was believed to have been a bail were presented in an urn to Ivo Bligh, later Lord Darnley. He bequeathed the urn to the MCC. It is now in the Memorial Gallery at Lord's. However, several historians have doubted the truth of this story. England reclaimed the Ashes in 2015.

Ashmolean Museum, the oldest public museum in the world. Located in Oxford, it was founded in 1683 by Elias Ashmole (1617–92). It reopened in November 2009 after major refurbishment.

Ash Wednesday, first day of Lent.

Asteroids are the tumbling rocks of the solar system. They move in orbits mainly between those of Mars and Jupiter (the asteroid belt). The first to be discovered (by Piazzi in 1801) was Ceres. Many tens of thousands more have since been discovered, of which over 2,000 now have well-determined orbits and have been named. Among the largest are Ceres (800 km), Pallas (500 km) and Vesta (530 km). Then come Hygiea, Davida, Interamnia, Europa, Eunomia, Sylvia and Psyche.

Few others have diameters of more than 80 km, while those of the majority are less than 5 or 10 km. Of particular interest are the Trojan group, located at the two stable "Lagrangian" points in Jupiter's orbit round the sun, where their locations make isosceles triangles with the sun and Jupiter. Also, a number of asteroids have orbits like that of Icarus which at perigee (*q.v.*) comes close to the sun.

The first probe designed to study asteroids (NEAR, Near Asteroid Rendezvous), launched in 1996, landed on the Eros 433 asteroid in 2001. This is one of the largest near-Earth asteroids. The Hayabusa probe was the first to land on an asteroid and then return to Earth. The Osiris-Rex probe, launched in 2016, will return to Earth in 2023 with samples from asteroid 1999 RQ36. The Dawn probe launched in 2007 is visiting Ceres (*q.v.*) and Vesta (*q.v.*). Many asteroids are now known to carry ice and water.

The small icy asteroid Chariklo is the smallest known object in the Solar System with its own ring system. The largest asteroid crater on earth has been found in the Australian outback.

NASA has now discovered over 10,000 near-Earth objects.

Astrobiology, a discipline bringing together those searching for extra-terrestrial life in space.

Astrolabe, a medieval scientific instrument for taking altitudes, observing the sun by day and the stars by night, and used for telling the time and finding the latitude. Used by the ancient Greeks, later by the Arabs and Persians, and introduced into Europe in the 14th cent.

Astronomer Royal. *See* **Astronomy** (*below*).

Astronomical Unit, the mean distance between the centres of the sun and earth, or the semi-major axis of the earth's orbit, has a value of about $1{\cdot}495979 \times 10^8$ km (149,597,900 km). This value has been constantly improved over the past 300 years, first using observations of the planets, later transits of Venus across the sun's disc, then observations of minor planets such as Eros as they came near the earth, and now by the transit time of a radar beam bounced off the planet Venus. The astronomical unit is fundamental for astronomers. *See* **Parsec**.

Astronomy. The Pythagoreans believed the stars and planets moved with uniform circular velocity in crystalline spheres, centred round the earth (the "harmony of the spheres"). Hipparchus (190–120 B.C.) made the first star catalogue, discovered the precession of the equinoxes and introduced the idea of epicyclic motion. His planetary system, in the form it was presented by Ptolemy 200 years later, held until the Renaissance when Copernicus revived the heretical view first put forward by Aristarchus of Samos (310–230 B.C.) that the sun and not the earth was at the centre.

Galileo, accurate observer and experimenter, went beyond Copernicus; helped by the contributions of Tycho Brahe, Giordano Bruno, Kepler and others, he was able to overthrow the Ptolemaic system of the heavenly spheres and Aristotelian philosophy and pave the way for Newton and modern astronomy. To Galileo we owe the conception of acceleration; to Newton the theory of universal gravitation; they showed that the same laws govern both celestial and terrestrial physics. Three landmarks in more recent times were the discovery of Uranus by Herschel in 1781 which extended the solar system as then recognised; the estimation by Hubble in 1924 of the distance of Andromeda, which showed that our Galaxy was just one of many; and Einstein's theory of relativity which improved on Newton's theory of the solar system by bringing gravitation into the domain of space-time. Today optical, radio, submm, ultra-violet, gamma ray and X-ray telescopes on the Earth and in space are revolutionising our understanding of astronomy.

The following have held the post of **Astronomer Royal** (period of office in brackets): John Flamsteed (1675–1719), Edmund Halley (1719–42), James Bradley (1742–62), Nathaniel Bliss (1762 65), Nevil Maskelyne (1765–1811), John Pond (1811–35), Sir George Airy (1835–81), Sir William Christie (1881–1910), Sir Frank Dyson (1910–33), Sir Harold Spencer Jones (1933–55), Sir Richard Woolley (1956–72), Sir Martin Ryle (1972–82), Sir Francis Graham Smith (1982 90), Sir Arnold Wolfendale (1991-95) and Sir (now Lord) Martin Rees (1995–). *See also* **Radio Astronomy.**

Astrophysics, the study of the properties, evolution and constitution of objects in the universe. It is concerned with the production and expenditure of energy in such systems as the stars and galaxies and their evolution. It was developed in the 19th century with the application of spectroscopy to the universe at large. Modern advances in particle physics, cosmology, X-ray, gamma-ray, infra-red, ultraviolet and radio astronomy revolutionised this subject. *See* **Astronomy, Cosmology**.

Athanasian Creed, one of the three ancient creeds of the Christian Church, often referred to as the *Quicunque Vult*. It is a statement of the doctrine of the Trinity and the Incarnation, and though named after St. Athanasius, it is thought to be the work of St. Ambrose (339–97).

Atmosphere is the gaseous envelope of the earth, and consists of a mixture of gases (*see* **Air**) and water vapour, the variability of the latter being of great importance meteorologically. The ozone layer, which absorbs solar ultra-violet radiation which would be lethal to plant life if it reached the ground lies between 12 to 50 km above the earth. The lower level of the atmosphere up to a height of about 12 km (10 km at the Poles and 16 km at the Equator) is known as the *troposphere*, and it is here that most weather phenomena occur.

This is the region of most interest to the forecaster studying temperature, humidity, wind-speed, and the movement of air masses. Temperature falls with height by about 1°C per 152 m in this layer. The *tropopause* is the boundary between the troposphere and the *stratosphere*. Temperature varies little in the lower levels of this region: it is mainly cloudless, and has no vertical currents. Strangely enough, the lowest temperatures of the atmosphere are to be found not at the Poles, but at about 18 km above the Equator, where a temperature as low as −80°C has been recorded!

Temperatures begin to rise about 32 km from the earth's surface at about the same rate as they fall in the troposphere owing to the absorption of solar radiation by the concentration of ozone. The stratospheric air is extremely dry. Near the 100 km level a number of important atmospheric phenomena occur. Above this level the oxygen becomes predominantly monatomic in contrast to the normal diatomic form at lower altitudes. This is the *ionosphere* (*q.v.*). This layer acts as an electrical radio mirror which makes long-distance radio transmission possible. The region of the Van Allen belts (*q.v.*) above the earth is called the magnetosphere (*q.v.*).

The auroras are most frequently observed at altitudes between about 100 and 400 km but do extend at times far higher.

Many aspects of the upper air can still only be studied through space-research techniques. These include the composition and temperature of the charged particles in the ionosphere, the location of the electric currents in the ionosphere which produce the regular variations of the compass needle, as well as those which circulate during magnetic storms, the variation of the intensity of different radiation in the air-glow (*q.v.*) with height, the composition of the air at heights above 32 km, and so on. In addition, the pressures, density, temperatures, and wind distribution of the neutral atmosphere can be studied more directly, in much greater detail, and up to much greater altitudes than is possible if one is confined to the use of equipment on the ground. Instruments outside the atmosphere can make systematic observations on a world-wide basis of the atmospheric circulation, through observation of cloud cover and of the thermal radiation into space from the atmosphere. Such observations are of great importance for meteorology.

The atmospheres of other planets are vastly different to our own. For example, the Venusian atmosphere is considerably denser than the Earth's and is composed primarily of carbon dioxide. Carbon dioxide is also the main constituent of the Martian atmosphere, although this is much thinner than that of the Earth. Titan, the largest satellite of Saturn, has a nitrogen-rich atmosphere. *See also* **Ionosphere.**

Atmospherics are electrical impulses which originate in atmospheric electrical discharges such as lightning. They give rise to crashing background noises in the loudspeakers of radio sets, interfering with reception at distances of up to 6,400 km from the centre of the disturbance. The location of atmospherics with the aid of radio direction-finding methods gives warning of thunderstorms.

Atom. *See* **Section T.**

Atomic Clock. *See* **Clock.**

Atomic Pile, an apparatus containing a fissionable element and a moderator, such as heavy water or graphite, in which a self-sustaining fission process proceeds at a controllable rate. The first atomic pile, constructed on a squash court at Chicago, was operated for the first time on 2 December 1942, under the direction of Enrico Fermi. The pile contained 12,400 lb (5,580 kg) of uranium. *See* **Nuclear Reactors.**

Augsburg Confession, name given to the doctrine of faith of the Lutheran churches, drawn up by Melanchthon and endorsed by Luther for the Diet of Augsburg (1530).

August, named after the Emperor Augustus, because it was his "lucky" month.

Auks, duck-like sea-birds, black and white, with short, narrow wings, compact bodies and legs set well back. Breed in colonies on rocky coasts of N. Europe (incl. British Isles) and spend most time in coastal waters. Migrate south in winter. The Auk family includes the Razorbill, Little Auk, Guillemot and Puffin.

The Great Auk became extinct in 1844 after ruthless hunting for its feathers.

Aurochs were long-horned beasts, an ancestor of domestic cattle. They died out in Britain nearly 3,000 years ago. They stood six feet tall.

Aurora Polaris. This wonderful phenomenon of the night sky is a common sight at high northern and southern latitudes, where it is called the *aurora borealis* and the *aurora australis* respectively. It is visible less often at temperate latitudes, and only rarely in the tropics. The auroral ovals, or zones of maximum frequency of aurora, surround both of the earth's geomagnetic poles, and the northern auroral oval includes the northern parts of Scandinavia, Canada and Alaska. The aurora is the visible manifestation of complex plasma processes occurring within the earth's magnetosphere (*q.v.*), whereby streams of high-energy electrons and protons (mainly) are accelerated and dumped via the earth's magnetic field lines into the upper atmosphere. This mechanism produces the light emission of the aurora.

The brightest aurora, which may also extend to lower latitudes, occurs during geomagnetic storms, which are complex and large-scale plasma instabilities within the magnetosphere triggered by fluctuations in the solar wind (*q.v.*) —usually ascribed to "M" regions on the sun associated with coronal holes, flares and active sunspot groups.

Auroral displays may take several forms—a faint glow, a diffuse ribbon of light crossing the heavens, great folded waving curtains or draperies, or the entire sky may be flooded with a rapidly varying brilliant panoply of light.

The aurora is a kind of light essentially different from that of the rainbow which is a partly subjective phenomenon. Each beholder sees his own rainbow, whose light is sunlight refracted and reflected by many raindrops. The raindrops that produce his rainbow depend on his position as well as on the direction of the sun. The aurora, on the contrary, is a light as objective as that of a candle, though produced differently. It is a self-luminescence of the air in regions of the atmosphere that lie far above the clouds.

Images from NASA's Polar spacecraft have confirmed the theory that auroras in the northern and southern hemispheres are nearly mirror images of each other. Such planets as Jupiter and Saturn have their own aurora.

Auto-da-Fé, or Act of Faith, was the ceremony connected with the sentencing of heretics under the Inquisition of Spain and Portugal, those found guilty being imprisoned or burned alive.

Automation is a technical word used to designate the adoption of methods of automatic control either of manufacturing processes or of any business process involving a large mass of routine work. The word is used in broader and narrower senses. In its broadest sense it covers any form of mechanisation which largely replaces human labour by the work of automatic or semi-automatic machines, such as has been in progress continuously since the Industrial Revolution; but it it better kept to a narrower meaning, in which it is confined to the modern development of electronic or similar devices, involving feedback (automatic detection and correction of malfunction). Human labour is virtually eliminated.

Autumn, the third season of the year, begins with the autumnal equinox, and ends with the winter solstice, but the term is used to cover the period from mid-August to mid-November.

Auxins, "plant hormones", the organic substances produced by plants to regulate growth. Synthetic auxins are now widely used, *e.g.*, for promotion of root formation in cuttings, differential weed control, prevention of premature dropping of fruit, in storage of potatoes *etc.* and to overcome frost damage to fruit buds.

Avalanches occur when layers of snow become unstable. Each of these 'white deaths' can send more than 1 million tons of ice, rock and snow thundering down mountain-sides.

Average is a single number designed to give a typical example of a set of numbers, *e.g.*, a cricketer's batting average for a season gives an idea of his typical score. There are several kinds of average and their uses are studied in the science of statistics (*q.v.*). A statement that "so and so is the average value" can be misleading if one does not know which average is meant. Three common averages are: the arithmetic average (or mean), the mode, and the median. The arithmetic average of n numbers is found by adding them together and dividing by n; this is a very common method of averaging. The mode of n numbers is the most frequently occurring number. The median is the middle number, *i.e.*, the number which is smaller than just as many of the other numbers as it exceeds. Of the numbers 1, 2, 2, 2, 2, 3, 4, 5, 6, 8, 9, the arithmetic means is 4, the mode is 2, the median is 3.

Avocet, a graceful wading bird related to the stilts, of black-and-white plumage, bluish legs, and slender upturned bill. There are four species.

Avocets nest in colonies. The return of the avocet has been an astonishing success story for the RSPB. It has an elaborate and fascinating courtship ritual.

Avogadro's Hypothesis. This is a fundamental concept of chemistry. Equal volumes of all gases under the same conditions of temperature and pressure contain the same number of molecules. This law was instrumental in assigning the formulae of molecules. The hypothesis was put forward in 1811, but not accepted until 1860.

Aye-Aye, the world's largest nocturnal primate.

Axion, a particle whose existence was first suggested in 1974. It weighs nothing, has no electric charge and exists for less than a nanosecond—but it may be a major component of dark matter.

Aztecs, the name of a powerful people found in Mexico when the Spaniards first discovered that country. At the height of Aztec power, *c.* 1325, their empire controlled a huge area of central America. There was an intricate system of tributes and blood sacrifice. The Spanish conquest obliterated much of their history and tradition. Centred on the capital Tenochtitlan, the empire stretched as far as Guatemala, Belize and El Salvador. Aztec cities are today acknowledged as design masterpieces.

B

Babiroussa, a ferocious, long-legged wild pig, native of Sulawesi, sometimes called the horned-hog, because of the long upper tusks in the male, which are developments of the canine teeth.

Baboon, monkeys belonging to the African genus *Papio*. They are considered the lowest of the Old World (Catarrhine) monkeys, and walk on all fours. In the main terrestrial, but take to trees after food. The mandrill is closely related. The DNA of baboons is 91% the same as human.

Babylonian Captivity, the period spent by the Jews in Babylon after Jerusalem fell to Nebuchadnezzar, the Babylonian emperor, in 586 B.C.

The term is also applied to the period 1309–78 when the papacy moved to Avignon.

Baccalaureate, a broadly-based academic diploma widely-used in Europe. It is set by a Swiss-based examination board.

Bacteriophage (**Phage**), literally "bacteria eater", *i.e.*, a virus which specifically infects bacteria. In common with viruses which attack animal or plant cells, isolated phages are inert, and can only reproduce by making use of the chemical apparatus of a more sophisticated host cell (in this case a bacterium). However phages may be of two types, virulent or temperate. Virulent phages completely disrupt the normal functioning of the infected bacterium and adapt its reproductive mechanism to produce more phage. This eventually kills the bacterium and the newly assembled phages are released. Temperate phages on the other hand may enter into a remarkable symbiotic relationship with the bacterium, known as lysogeny. The phage genetic material is incorporated into that of the bacterium and is reproduced each time the still functioning bacterium subsequently divides. Furthermore the bacterium is immune from attack by potentially virulent phages of the same type. When such lysogenic bacteria die, phage particles may again be released. Phages carried in lysogenic bacteria are in a state known as prophage and it is often difficult to obtain pure, prophage-free strains of bacteria. Phages have been extensively used in research on genetics and molecular biology.

Badger, a carnivorous mammal related to the weasel, of nocturnal and burrowing habits, inoffensive, subsisting chiefly on roots and insects, though sometimes mice, young rabbits and eggs form part of its diet. The badger does little harm and quite a lot of good. In Britain the badger is partly protected, but Ministry officials may destroy the animal in areas where bovine TB exists. Pilot badger culls began in the West Country in 2013 (badgers are blamed for the spread of bovine TB by urinating on the fields where cattle graze). These culls are now being extended. The 1992 Badger Protection Act led to greatly increased numbers.

Bagpipe. Once popular all over Europe, this instrument is still played in Scotland, Ireland, Brittany and elsewhere. The bag acts as a reservoir of air and, when squeezed by the player's arm, forces air through the pipes. One of these, the Chanter pipe, provides the tune and is played by the fingers as in a flageolet. The remainder, the Drone pipes, give a continuous, unvarying note.

Bailey Bridge, invented by Sir Donald Bailey and first used in the N. African campaign 1942–3. Built up of prefabricated girders, it can be easily transported and erected.

Bailiwick, a feudal term denoting the limits of a bailiff 's jurisdiction. The term has survived in the Channel Islands (e.g. Jersey and Guernsey).

Baldachin (It. *Baldachino*), a canopy usually supported by four pillars over throne, altar *etc*.

Balearic Crane, the crowned crane of the Balearic Islands and the North African mainland, distinguished by its yellowish, black-tipped occipital tuft and by its trumpet note.

Baleen *or* "whalebone" the name given to a series of horny plates growing from the roof of the mouth in those whales classified as Whalebone or Baleen Whales (*Mystacoceti*). There are 300–400 or so plates on each side. Their inner edges are frayed, the whole system constituting a filter for collecting minute organisms used for food.

The Baleen Whales include the Right-Whales, Pacific Grey-Whales and Rorquals. *See* **Whales.**

Ballet is a combination of four arts; dancing, music, painting, and drama, each of which is ideally of equal importance. The movement of the individual dancers and the "orchestration" of the whole group is in the hands of the choreographer. The dancer's training follows certain basic rules but save in classical ballet there is considerable freedom of movement.

Ballet today developed professionally at the Court of King Louis XIV of France, though it owes its origins to Italy and in the earliest times to Greece and Rome. Its movements were made up from the dances of courtiers, country folk and tumblers. Technique grew more complex as costume became modified, the body gaining complete freedom with the invention of tights. A succession of great dancers—French, Italian and latterly Russian left their imprint on the art. Contemporary ballet reflects the aesthetics of the Russian, Sergei Diaghilev. In England Dame Ninette de Valois laid the foundation of a national ballet, at Sadler's Wells and Covent Garden. A Royal Charter was granted in 1957 setting up the Royal Ballet to co-ordinate the work of the Sadler's Wells group. *See* **Section P**.

Ballistics, the science dealing with the motion of projectiles, especially shells, bombs and rockets.

Balloon, the modern balloon consists of a bag of plastic material inflated with a gas lighter than air. The first ascent by man in a hot-air balloon was made on 21 November 1783, and in a hydrogen balloon on 1 December 1783. The most famous of the early scientific flights by manned balloons were those of the Englishmen Coxwell and Glaisher, in 1862, when a height of 11 km was reached. The first aerial crossing of the English Channel by Blanchard and Jeffries was made on 7 January 1785. Piccard's ascent to 16 km, in 1931, marked the conquest of the stratosphere. Four years later the American balloon *Explorer II*, inflated with nearly 112,000 m^3 of helium, carried a team of scientists with their floating laboratory to an altitude of 23 km. In 2002 the American Steve Fossett became the first solo balloonist to circle the globe non-stop. In 2016 the fastest around-the-globe record was established by a Russian priest, Father Fedor Konyukhov.

Balsam, a big genus (140 species) of flowering plants. Many species are cultivated for their showy flowers, *e.g.*, *Impatiens noli-me-tangere*, the yellow balsam or "touch-me-not", so called because the fruit explodes when touched, slinging out the seeds. Balsam fir is a conifer (*Abies balsamea*) from which Canada balsam gum is obtained.

Bamboo, a genus of strong grasses, some species growing to over 36m in height; much used in Asia for all kinds of purposes. Half the world's woody bamboo species is under threat of extinction as a result of forest destruction. China producer *c.* 80% of the world's bamboo, while around 1 bn people live in houses made of bamboo.

Banana (family *Musaceae*), a large herbaceous plant cultivated in moist regions of the tropics, and one of the most productive plants known. The main areas of commercial cultivation are in tropical America, the Canary Islands and West

Africa. Bananas have overtaken the apple to become the favourite fruit in Britain, but they are threatened with a rapidly-spreading fungal disease (known as Panama disease).

Bandicoots, Australasian marsupial mammals, of the size of a large rat or rabbit. They are burrowing animals living largely on insects. The rabbit-eared bandicoot, restricted to Australia, has shrew-like snout, long ears like a rabbit, long crested tail, and a silky coat. The long-nosed bandicoot has a spiny coat and comes from E. Australia. The pig-footed bandicoot has two functional toes on the foot, like a pig.

Bank of England. Founded by Royal Charter on 27 July 1694. Known as "The Old Lady of Threadneedle Street". It was established to raise funds for William III's; war against France.

Bank Holidays. Public holidays in England and Wales comprise at present six bank holidays (New Year's Day, Easter Monday, May Day, Spring and Late Summer Holidays at the end of May and August respectively, and Boxing Day), with also two common law holidays (Good Friday and Christmas Day); in Scotland (beginning in 1996) seven bank holidays (New Year's Day, Good Friday, Easter Monday, May Day, Spring and Late Summer Holidays at the end of May and August respectively, and Christmas Day); and in Northern Ireland seven bank holidays (New Year's Day, St. Patrick's Day, Easter Monday, May Day, the Spring Late Summer Holidays at the end of May and August respectively, and Boxing Day) plus two other public holidays (Easter Tuesday and the anniversary of the Battle of the Boyne).

There are holidays in lieu of those public holidays which fall at weekends. In Scotland and Northern Ireland a general holiday is not necessarily observed on the same day as a bank holiday.

Bantu (native word = people), term loosely used for large family of black races of Southern Africa.

Baobab, a tropical African tree. The species *Adansonia digitata* is one of the largest trees known, though not the tallest; the trunk can reach 9 m in thickness. The fruit is woody, but its juice provides a cooling beverage (high in vitamin C). Its fruit is a powerhouse of nutrients. The bark yields a fibre used for making rope and cloth.

The baobab is the national symbol of Madagascar.

Barbary Ape, a large monkey belonging to the genus *Macaca*. It is the only monkey living in relative freedom in Europe, a small colony existing on the Rock of Gibraltar. It has no tail.

Barberry, a genus of berry-producing shrubs containing a hundred species. Several species are cultivated for their flowers and bright berries. Has an interesting pollination mechanism; the base of each stamen is sensitive to touch, and insects probing for nectar cause top of stamen to spring inwards, so dusting visitor's head with pollen which can then be carried to the next flower visited. The common barberry (*Berberis communis*) harbours one stage of the fungus that causes rust of wheat.

Barbican, a fortified entrance to a castle or city, with projecting towers. In the London area called Barbican there was formerly a barbican in front of the city gates.

Barbiturates. A group of drugs derived from a parent compound called barbituric acid: phenobarbitone is the best-known example. They induce sleep and are used in the manufacture of sleeping pills, but they can be habit forming.

Barcarolle, a Venetian gondolier's song.

Bard, among the ancient Celts a poet or minstrel whose mission was to sing of heroic deeds. He was supposed to have the gift of prophecy, and was exempt from taxes and military service.

Barilla, soda carbonate or soda ash obtained by burning certain salt-marsh plants (*e.g.*, the saltwort, *Salsola kali*). It used to be in great demand, until the product of the Leblanc and then the Solvay ammonia-soda process was made available by the chemical industry.

Barium, metal element, no. 56, symbol Ba. In group 2 of the periodic table. The metal is soft and easily cut. It occurs as the sulphate and carbonate in nature. It was first prepared by Sir Humphry Davy in 1808, as an amalgam, by electrolysis of barium chloride. The pure metal was not isolated until 1901.

Barnacles constitute a sub-class (*Cirripedia*) of the Crustacea. The barnacle fouling the bottom of ships is the Goose Barnacle, which has a long muscular stalk and a shell composed of five plates. The Acorn Barnacles, which cover rocks, breakwaters, etc., just below high-water mark are similarly constructed, but have no stalk. The manner of feeding of barnacles was vividly described by T. H. Huxley, who said the barnacle is "a crustacean fixed by its head kicking the food into its mouth with its legs". It was a naval surgeon, J. Vaughan Thompson, who discovered in 1830 that barnacles have a free-swimming larva (or nauplius). In the Middle Ages a curious myth grew up to the effect that the Barnacle changed into a sea-bird called, for that reason, the Barnacle Goose.

Barnard's Star. A star discovered by the American astronomer Edward Emerson Barnard in 1916 and which has the largest stellarproper motion known. Barnard's Star is one of the closest stars to us and also one of the intrinsically faintest stars known.

Barometer is an instrument for measuring atmospheric pressure, invented at Florence by Torricelli, pupil of Galileo, in 1643. The standard method consists of balancing the air column against a column of mercury, used on account of its high density. The mercury is contained in a long glass tube, closed at one end, and inverted in a cistern also containing mercury. The height of the mercury column, supporting the air column, is taken as the pressure at the time, and can be read off very accurately by means of a vernier scale. Present-day tendency is to express the readings in units of pressure instead of length, the millibar being adopted (1 mb = 1,000 dynes per sq. cm.; 1,000 mb ≡ 75 cm of mercury approx.). The standard instrument is correct for pressures at 0°C in Lat. 45°, so that corrections have to be applied for temperatures and latitudes other than these. Also a correction has to be made for reducing the pressure to mean sea level. *See* **Aneroid.**

Baron, title given in feudal England to a man who held his land directly from the king by military or other honourable service. The first baron created by letters patent was John Beauchamp de Holt, Baron of Kidderminster, in 1387. A baron is a member of the fifth and last grade of the peerage of the United Kingdom and is addressed as "Lord". Life peers and life peeresses rank with hereditary barons and baronesses according to the date of their creation. In Scotland the term baron is used of the possessor of a feudal fief, or the representative by descent of such a fief. The equivalent of the English baron, as a rank of the Scottish peerage, is Lord of Parliament.

Baronet, the lowest hereditary title, instituted by James I to provide funds for the colonisation of Ulster. The first baronet was Sir Nicholas Bacon. Between 1964 and 1983 no recommendations for hereditary honours were made. In 1990 the Queen bestowed the title on Denis Thatcher.

Barque, a small sailing vessel with three or four masts. A three-masted barque has fore- and mainmasts square-rigged, the mizzenmast fore- and aft-rigged.

Barramundi, a tropical fish much prized in Australia.

Barrow is an ancient artificial mound of earth or stone raised over the site of a burial. In Britain barrows were built from 2500 B.C. until the late Saxon period, but the Egyptian are the earliest barrows known, the great pyramids being a spectacular development of the custom of ceremonial burial. Silbury Hill, south of Avebury, is the biggest artificial mound in Europe, 512 m in circuit at the base, 96 m at top, and 41 m high.

Baryons, the group of heavier subatomic particles which includes the proton, neutron, lambda and omega-minus particles (and their corresponding anti-particles, called anti-baryons). Baryons interact by means of all the known forces of nature (strong, weak, electromagnetic and gravitational). However, in any closed system the total baryon number (*i.e.*, the number of baryons minus the number of anti-baryons) is constant. This means that the proton, being the lightest known baryon, must be stable against spontaneous decay. Unlike the lighter leptons (*q.v.*), baryons are now thought to have internal structure reflecting the fact that they are composed of quarks (*q.v.*) *See also* **Section T.**

Basalt Rocks are fine-grained, dark coloured, of igneous origin and occur either as lava flows as in

Mull and Staffa, or as intrusive sheets, like the Edinburgh Castle Rock and Salisbury Crags. One of the best examples of columnar basalt is the Giant's Causeway in Ireland.

Basanite (**Lydian Stone**), a smooth black siliceous mineral, or flinty jasper; a crypto-crystalline quartz used as a touchstone for testing the purity of gold, *etc.*, by means of the mark left after rubbing the metal with it.

Base, a substance having a tendency to accept a proton (H^+). This is a wide definition and covers unconventional types of compounds. In aqueous solution bases dissolve with formation of hydroxyl ions, and will neutralise an acid to form a salt. In non-aqueous solvents, like liquid ammonia or hydrogen fluoride, compounds classically regarded as salts can be bases, *e.g.*, sodium fluoride is a base in hydrogen fluoride solution.

Basilisk, is a lizard of aquatic habits, with an elevated crest (which it can erect or depress at will) down the centre of its back.

Basques, people of N. Spain and S.W. France, oldest surviving racial group in Europe, who have preserved their unique ancient language.

Bastille, a castle or fortress in Paris, built in the 14th cent., and used as a state prison, especially for political offenders. It was stormed and demolished on 14 July 1789, at the start of the Revolution.

Bastinado, a cruel punishment, by beating with a pliable cane on the soles of the feet.

Bats. These mammals fly by means of a membrane stretched between each of the long fingers of the hand and between the fifth finger and the body. Another membrane stretches between the legs and the tail. Most British bats, including the pipistrelle, long-eared bats, noctules, belong to the family *Vespertilionidae* (with the exception of the horseshoe bats which belong to the family *Rhinolophidae*). These all feed on insects which they catch on the wing. Vampire bats (there are 3 species) are found across Latin America. Vampire bats use infra-red sensors on their noses to find blood close to the skin of their victims. A drug derived from vampire bat saliva is being used to help stroke victims.

The problem of how bats can detect their insect prey and avoid obstacles when flying in total darkness was solved with the advent of sensitive ultrasonic recording devices.

Scientists now know that bats can distinguish between two objects the width of a pencil line apart by using their sonar echo. Blindness does not affect this ability but deafness leaves bats comparatively helpless. Bats also adjust their internal compasses to the way light is scattered at sunset. A unique array of wing sensors gives bats the key to their aerial manoeuvrability.

One of the most interesting types of bat is the fishing bat (*Noctilio*) found in central America, which can detect fish by being able to receive echoes from the ripples they make on the water surface. Across the world, there are 1,100 species of bats, but around one in five is now at risk from habitat loss. There are 17 breeding species of bat in Britain, but their numbers have now revived after a long decline. The bamboo bat of China is one of the tiniest mammals in the world. The Australian fruit bat (or flying fox) is the largest in the world. *See* **Ultrasonics.**

Bath, Order of the, Britain's second oldest order of knighthood. Exclusive to men since its institution by Henry IV in 1399, women became eligible for admission to the order in 1971.

Battery, Electric, the common term for an electric cell but really meaning a combination of two or more cells. A cell is a device for converting stored chemical energy into electricity which can then be used for heat, light, traction, or any desired purpose. A *primary* cell will do this until the chemical action is completed and the cell is then useless. In a *secondary* cell, the chemical actions are reversible and the cell can be returned to its initial condition and used again. This is done by passing an electric current through—a process called recharging.

A common primary cell is the Leclanché dry cell; used in torches. This works by the action of sal-ammoniac on electrodes made of zinc and carbon. About a century after it came into common use it is still the chief source of power for portable equipment in armed forces. A common secondary cell is the lead and sulphuric acid accumulator used in cars. Many other types of cell are known and some are under development because the demands of space travel, medicine, warfare, *etc.*, call for batteries of lighter weight, greater reliability, or special properties. *See* **Fuel Cell, Energy Conversion.**

Bauxite, the chief source of aluminium. Chemically it is aluminium oxide. Aluminium metal is made industrially by electrolysing purified bauxite dissolved in fused cryolite.

Bayeux Tapestry, famous embroidery representing the conquest of England by William the Conqueror. It is embroidered on a band of linen 70 m long and 51 cm wide in blue, green, red and yellow, divided into 72 scenes ranging over the whole story of the conquest. The accepted view is that the tapestry was commissioned for Bayeux Cathedral, but another interpretation is that it is an Anglo-Norman secular work of art, much influenced by the contemporary *chansons de geste* (songs of deeds), executed by English embroiderers for a Norman patron. A representation can be seen in the V&A Museum.

Beagle, a small hound that tracks by scent.

Bears belong to the Ursidae family of the Carnivora. They are plantigrade mammals, walking (like humans) on the soles of their feet. Found in most parts of the world except Australia. The common Brown Bear was once spread over the whole of Europe; it became extinct in England about the 11th cent.; 2–2·5 m in length, and stands 1 m or more at the shoulder.

The Grizzly Bear of N. America is larger, and the coat is shorter and greyer. The Polar Bear is remarkable in having a white coat all the year round; it spends much time in water, and unlike other bears is entirely carnivorous. The polar bear is the most powerful of all predators. Bearbaiting was made illegal in England in 1835. The brown bears of Europe are at last witnessing a revival. The spectacled bear is the most threatened. Sloth bears are indeed true bears, but gain their name from their resemblance to sloths.

It is now known that polar bears are cannibals. Climate change poses a challenge to the future of the Arctic polar bear (there are around 20–30,000 polar bears in the wild, from Russia to Alaska and from Canada to Greenland and Norway's Svalbard archipelago). They are now on the endangered list, but attempts to ban the international trade in their skins, teeth *etc* failed in 2010.

Beaver, a genus of mammals of the Rodentia order, with short, scaly ears, webbed hind feet, and a long broad scaly tail. They grow up to 1·2 m long, and live in communities, constructing complex dams and lodges where they breed. They have now made an impressive comeback to Britain and Europe. The beaver, Europe's largest rodent, weighs nearly 45lbs. Hunted for its pelts. Newborn beavers are known as kits. They are rightly called busy beavers.

Bedlam (a corruption of Bethlehem) was a priory in Bishopsgate, afterwards converted into a hospital for lunatics. The asylum was transferred to St. George's Field, Lambeth, in 1815.

Bedouin, the nomads of the desert. The name comes from the Arabic for desert dweller.

Bee. *See* **Humble-bee L54–5.**

Beech, a deciduous tree belonging to the genus *Fagus* of some eight or nine species found in north temperate regions. The common beech, *F. sylvatica*, is believed to be native to Britain and is one of our finest trees, with massive trunk, long, pointed winter buds, and smooth, grey bark. There is little undergrowth under its dense shade. It is shorter-lived than the oak taking about 200 years to reach full size and then declining. The timber of beech has a variety of uses, *e.g.*, spoons, handles, chairs, *etc*.

Bee-eater, name of a family of brilliantly coloured birds closely related to the rollers and kingfishers inhabiting the tropical and sub-tropical parts of Africa, Asia and Europe. The European species successfully nested in Britain back in the 1950s.

With their long curved beaks they catch insects on the wing, especially bees and butterflies, and lay their eggs in dark tunnels.

Beefeater, *See* **Yeomen of the Guard.**

Beeswax, the secretion of the bee, used for the formation of the cells or honey-comb of the hive; when melted it is what is commercially known as yellow wax, white wax being made by bleaching. Being impervious to water, it acts as a good resistant and is an article of much utility.

Beetles (Coleoptera) constitute one of the biggest orders of insects, numbering over 350,000 species. There are two pairs of wings; the hind pair are used for flight, while the front pair are hardened to form a pair of protective covers (elytra). Some beetles have lost the power of flight and then the elytra are joined together. Beetles are the planet's most enduring species.

Bell, a hollow body of metal used for making sounds. Bells are usually made from bell-metal, an alloy of copper and tin. Small bells used for interior functions are often made of silver, gold or brass. Ordinary hand-bells are of brass. From the 7th cent. large bells were used in England in cathedrals, churches and monasteries. The greatest bell in the world is the "King of Bells" in the Kremlin at Moscow which weighs about 198 tonnes, is 627 cm high and 691 cm in diameter. It was cast in 1733 but cracked in the furnace (the broken part weighed 11 tonnes) and is now preserved as a national treasure.

The Great Bell (Great Paul) at St. Paul's, cast in 1881, weighs nearly 17 tonnes and is the largest in the UK.

Other huge bells are the Great Bell at Beijing (53 tonnes); Nanjing (22 tonnes); Cologne Cathedral (25 tonnes); Big Ben, Westminster (over 13 tonnes); Great Peter, York Minster (10 tonnes). The Curfew Bell is rung in some parts of England to this day, notably at Ripon.

The number of changes that can be rung on a peal of bells is the *factorial* of the number of bells. Thus four bells allow 24 and eight bells 40,320.

Belladonna or **Deadly Nightshade** (*Atropa belladonna*), a well-known poisonous wild plant found in Southern Europe and Western Asia. The alkaloid atropine it contains is valuable in medicine, although a large dose is poisonous.

Benedicite, the canticle in the Book of Common Prayer, "The Song of the Three Holy Children".

Benedictines are monks and nuns of the Benedictine Order who live under the rule of St. Benedict—the monastic code whose influence on the religious and cultural life of the West has been so powerful. The rule is marked by an absence of extravagant asceticism.

The greatest of the early Benedictines was Pope Gregory I (590–604) who sent St. Augustine of Canterbury to convert Anglo-Saxon England. Gregorian plainsong is named after him. Benedictine (probably the oldest liqueur in the world) was first made by a Benedictine monk.

Benin Bronzes, the name for hundreds of artefacts looted in colonial times from Benin City in southern Nigeria. They were created by the Edo people from the 13th century.

Benzene. An aromatic hydrocarbon obtained from coal tar and some petroleum fractions. It is a volatile inflammable liquid with a characteristic smell. The molecule consists of a flat ring of six carbon atoms, each bound to one hydrogen atom. Benzene is the parent member of many aromatic organic compounds and is widely used in industry to synthesise intermediates for fibres, dyestuffs, explosives *etc.*

Beryl, a mineral, of which the emerald is a grass-green variety. It is composed of beryllium and aluminium silicates. The pure mineral is colourless; the colour of most beryl comes from traces of impurities, notably iron and chromium. Otherwise it is yellowish, greenish-yellow, or blue, and is found in veins which traverse granite or gneiss, or embedded in granite, and sometimes in alluvial soil formed from such rocks.

Beryllium. Metallic element, no. 4, symbol Be. Very similar to aluminium, it is stronger than steel and only one-quarter its weight. It is not very abundant, its main source is the mineral, beryl. Copper containing 2 per cent. beryllium is used for making springs. Because of its special properties the metal is used as a component in spacecraft, missiles and nuclear reactors. This accounts for its recent development on a technical scale. The metal powder is toxic.

Bessemer Process for making steel depends on the forcing of atmospheric air into molten pig iron to burn out the impurities. Ousted by the oxygen converter. *See* **Steel.**

Betel, the leaf of an Indian climbing plant, of pungent, narcotic properties. It is destructive to the teeth, and reddens the gums and lips.

Bhang, the Indian name for the hemp plant *Cannabis sativa*, the leaves and seed-capsules of which are chewed or smoked. The drug which comes from flowers of the female plant is called hashish in Arabia and marihuana in the USA.

Big Bang Theory, a cosmological model in which all the radiation and matter in the universe originated in an explosion at a finite time in the past. It is thought the universe came into existence between 10 and 15 thousand million years ago.

Billion, formerly in English usage a million million; now a thousand million or 10^9.

Binary Notation, for numbers, is a way of representing numbers using only two digits, 0 and 1. Electronic digital computers handle numbers in this form. The ordinary, or decimal numbers, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 are written in binary notation as follows: 0, 1, 10, 11, 100, 101, 110, 111, 1000, 1001, 1010. The reader might divine the rules from this. The point is you "carry 1", *i.e.*, move the digit 1 a place to the left, when you reach 2. In decimal notation you move 1 a place left when you reach 10. In other words, instead of columns for units, tens, hundreds, thousands, *etc.*, the columns are for units, twos, fours, eights, *etc.* In binary notation: "1 + 1 = 0 with 1 to carry". Since every digit in binary notation is either 0 or 1 it requires one bit of information to specify a binary digit.

Bioethanol, a derivative of ethanol in the form of ethyl-tertio-butyl-ether (ETBE), used as fuel and processed from agricultural crops (*e.g.* rape). The first plant in Britain opened in Norfolk in 2008.

Biofluorescence, the process that enables organisms to absorb light, transform it and reflect it in a different colour.

Biological Clock. All living organisms undergo cyclical changes in activity of some sort. These are linked to the changes in their environment which are produced by the alternation of night and day, the phases of the moon and the tides, and the cycle of the seasons. These cycles of activity frequently persist if the organism is put into a constant environment in which there appear to be no external clues as to what time or what season it is. A squirrel, for example, wakes up at about the same time each evening even when it is put into constant darkness. It is usual to refer to these activity patterns as being driven by a biological clock inside the organism. But very little is known about how these biological clocks work.

Biological Warfare is the use for warlike purposes of bacteria, viruses, fungi, or other biological agents.

Bioluminescence. The spectacular, magical light produced by such living things as glow-worms, fireflies and plankton.

Biometrics, detailed measurements of human characteristics, such as the iris or fingerprints, now used in high-tech security systems. Airports are starting to use retinal scans to check identities.

Biosensors, micro-electronic or optoelectronic devices used to sense the presence of chemicals. This new technique for diagnosis and analysis has a host of applications in medicine, industry *etc.*

Biosphere, that part of the earth in which life exists—a very thin layer near the surface bounded by regions too hostile for life processes to occur. The upper limit is at about 9,000 m above sea level and the lower limit at about 10,000 m in the deep oceans. Ample supplies of solar energy, liquid water and places where liquid, solid and gas all meet seem to be requirements for a biosphere to exist and for all the biological cycles of water, oxygen, mineral, nitrogen, *etc.*, to function.

Birch, a genus of deciduous trees including about 40 species and found only in northern regions. Birches native to Britain, and to Europe generally, are of two species—the silver birch, *Betula pendula*, with its graceful, drooping branches and triangular leaves, and the white birch, *Betula pubescens*, which has erect branches and soft oval leaves. Birch timber is an important plywood timber, the bark is used for tanning leather, and wintergreen oil comes from the bark of black birch, *Betula lenta*, a North American species. The birch is not long-lived.

Birds, or Aves, are, next to mammals, the highest class of animal life. There are two kinds of modern birds—*Carinatae*, possessing keeled breast-bones and having the power of flight; *Ratitae*, having raft-like breast-bones, and incapable of flight; and a sub-class of fossil birds, Archaeornithes, including *Archaeopteryx*.

Estimates of the number of species breeding in Britain vary, but there are probably *c.* 244. The commonest are wrens, house sparrows, blackbirds, chaffinches, robins and starlings. Many bird species are continuing to decline (in the UK. The cuckoo, nightingale, willow tit, starling and turtle dove are under great pressure). Some, however, are thriving as a result of conservation projects (*e.g.* kingfishers, stone-curlews and buzzards). Birds in Britain are now laying their eggs earlier to combat earlier springs. Light receptors deep in their brains detect the changing day length.

The wheatear is usually the first of the migratory birds to return, often reaching Britain at the end of February and always before the middle of March; the sand martin is the first of the "early swallows" to return, followed by the house martin. The first cuckoo arrives about the middle of April, and the whinchat, garden warbler, and sedge warbler during the last week in April. The nightjar, spotted flycatcher, and red-backed shrike are not seen until the first week in May. The swift is among the last to return from Africa and the earliest to depart. The smallest flying bird in the world is the bee hummingbird.

Bird-nesting is illegal in Britain. With the passing of the Wildlife and Countryside Act in 1980 the trapping and caging of numerous birds was made illegal in Britain.

Some scientists think birds did not evolve from feathered dinosaurs but rather from prehistoric lizards (*archosaurs*). Some birds have reached the age of 80, but until ringing them in the nest began we knew little of their lifespan.

Modern research has shown that birds rival dolphins and chimpanzees in intelligence. Birds can understand each other's intentions and can use tools more efficiently than chimpanzees. Even though some birds only have pea-sized brains, their mental capacities can surpass those of chimps. However, scientists have now proven that birdsong is innate and not learned (and baby birds are known to babble as they learn to sing, just as human infants do). *See also* **Section T**.

Birds of Paradise, over 40 species of tropical birds inhabiting the dense forests of New Guinea and neighbouring islands. The male birds are remarkable for their brilliant plumage, long tail feathers, and ruffs on wings and neck, which are displayed to advantage during courtship. There are 38 species found in New Guinea.Related to the Bower Birds of Australia.

Biretta, a four-cornered head-covering worn by ecclesiastics of the Roman Church and varying in colour according to rank. A cardinal's biretta is red, a bishop's purple, a priest's black.

Bise, a keen dry north wind prevalent in Switzerland and South France.

Bisextile. *See* **Leap Year.**

Bishop is a Christian ecclesiastic, a person consecrated for the spiritual government of an area, a diocese or province, to the spiritual oversight of which he has been appointed (diocesan bishops), or to aid a bishop so appointed (suffragan bishops). In the Church of England, two, Canterbury and York, are archbishops having primacy in the respective provinces.

The archbishops of Canterbury and York and the bishops of London, Durham and Winchester and 21 other diocesan bishops in order of seniority are spiritual peers, and sit in the House of Lords.

The (Disestablished) Church of Ireland has two archbishops and twelve bishops; the (Disestablished) Church of Wales an archbishop and five bishops and the Episcopal Church in Scotland seven bishops. *See also* **Cardinal.**

Bismuth, metallic element, no. 83, symbol Bi, in group 5 of the periodic table. Like antimony, the stable form is a grey, brittle, layer structure; electrical conductor. It is readily fusible, melting at 264°C and boiling at about 1420°C. Wood's metal, an alloy with one of the lowest melting points (under 65°C, so that a spoon made of it will melt when placed in a cup of hot tea), contains four parts bismuth, two parts lead, one part tin, one part cadmium.

Bison, a genus of wild cattle, distinguished from the ox by its shorter, wider skull, beard under the chin, high forequarters, and, in winter, a great mane of woolly hair covering head and forequarters. There are two species, the European and the American bison. The European bison, which tends to browse (or munch trees and leaves rather than graze) is now making a comeback in Eastern Europe. Once, up to 60 million bison roamed the great plains west of the Mississippi. They are better known as American buffalo. The largest wild population today is in Yellowstone.

Bit, formerly the word often referred to the metal piece in the mouth of a bridled horse, now more likely to be a technical expression in the mouth of a computer expert. A bit is a unit of information; it is the information that can be conveyed by indicating which of two possibilities obtains. Any object that can be either of two states can therefore store one bit of information. In a technical device, the two states could be the presence or the absence of a magnetic field, or of an electric voltage. Since all numbers can be represented in the binary system (*see* **Binary Notation**) by a row of digits which are *either* 0 *or* 1, it takes one bit of information to specify a binary digit. Bit is short for binary digit.

Bittern, a bird of the heron genus, with long, loose plumage on the front and sides of the neck. It is a solitary bird inhabiting marshes, but rare in Britain where its numbers fell to *c.* 15 breeding pairs in Norfolk, Suffolk and Lancashire. An ambitious scheme was launched in 1995 to save it from extinction underway all across the country.

Bivalves, shell-fish whose shell consists of two hinged valves, lying one on each side of the body, such as mussels, oysters and cockles.

Blackbird, or Merle, a member of the Thrush family, a familiar song bird in Britain. Male is all-black with orange bill; female is mottled brown with brown bill; the young are spotted brown. Blackbirds patrol their patches, chasing away rivals. Blackbird numbers are now reviving slightly.

Blackcock and Greyhen (as the female is called) are closely related to the Capercaillies but smaller. They nest on the ground and prefer wooded country to open moors. Found in northern half of northern hemisphere. Polygamous, they perform excited courtship dances; the male is a handsome blue-black bird with white undertail, the female dark brown mottled.

Black Holes. Section T, Part I.

Black-letter, the Old English or Gothic type first used in printing blocks.

Black Woodpecker (*Dryocopus martius*), a black bird about the size of a rook, with slightly crested scarlet crown, found in parts of Europe.

Blenny, a group of marine fishes with spiny rays part of the fin running along the back. Several species are found around the British coast.

Blood Moon, a total lunar eclipse. Once seen as a harbinger of doom.

Bluebird, a migratory bird of North America, deriving its name from its deep blue plumage, it has a pleasant warbling song and is a familiar sight in the woods from early spring to November. In India and Malaysia there is the Fairy Bluebird; the male is black with shiny blue upper parts. Used as the symbol of happiness by Maeterlinck in his play *The Blue Bird.* It is the state bird of New York.

Blue Marlin, the world's ultimate game fish, now threatened with extinction by over-fishing.

Blue Peter, a blue flag with a white square in the centre, is hoisted 24 hours before a ship leaves harbour (the letter P in the alphabet of the International Code of Signals).

Blue Ribbon, a term in general use to denote the highest honour or prize attainable in any field or competition. Thus the Derby is the blue ribbon of the turf. The expression is derived from the highest Order of Knighthood in the gift of the British Crown, the insignia of which is a garter of blue velvet.

Blue Sun, Blue Moon, etc., a phenomenon caused by the differential scattering of sunlight by transparent particles suspended in the atmosphere, the effect being that blue light is transmitted, and red light extinguished to direct vision. The dust from the Krakatoa eruption in 1883 and the drifting smoke from the forest fires in Alberta, Canada, in 1950 gave rise to "blue" moons and suns, phenomena sufficiently rare to be described as occurring "once in a blue moon".

Bluetongue, virulent virus, carried by midges, which mainly affects sheep (but also cattle and goats).

Boa, a term applied to a family of snakes of large size, some attaining a length of 9 m. They are not poisonous, but kill their prey by crushing — constriction—hence the name "boa constric-tor".

They occur both in the Old World and the New, but are more abundant in the latter. Most Boas retain the eggs within the body until young are fully developed, whereas the Pythons almost all lay leather-shelled eggs.

Boar, or Wild Hog, an animal largely distributed over the forest regions of Europe, Asia, Africa and South America. It has a longer snout and shorter ears than its descendant the domestic hog, and is provided with tusks. Having to forage for itself, it is a more active and intelligent animal than the pig of the sty.

Boat, an open vessel, propelled by oars or sails, or both. The boats of a ship of war are the launch, barge, pinnace, yawl, cutters, jolly boat and gig; of a merchant vessel, the launch, skiff, jolly boat or yawl, stern boat, quarter-boat and captain's gig.

Bode's Law, a numerical relationship formulated by Bode in 1772 (though pointed out earlier by J. D. Titius of Wittenberg), which states that the relative mean distances of the planets from the sun are found by adding 4 to each of the terms 0, 3, 6, 12, 24, 48, 96, and dividing each number by 10. The gap between Mars and Jupiter caused Bode to predict the existence of a planet there, later confirmed by the discovery of Ceres and other minor planets. The law breaks down for Neptune and Pluto.

Boers, name given to Dutch settlers, largely farmers, in South Africa after the 17th century. Discontented with British rule in the Cape after 1820, they emigrated northwards in 1835–37; after much fighting with the local people, they founded the Orange Free State (1836) and the Transvaal Republic (1848). The Transvaal declared itself independent in 1852. In 1877, after war with the Zulus, it was annexed to the British dominions; in 1879 it was declared a Crown Colony. For the **Boer War,** *see* **E3**.

Boiling-point is the temperature at which a liquid boils. At that point the pressure of the vapour is equal to the pressure of the atmosphere. Under increased pressure the b.p. rises and under less pressure, as on the top of a mountain, it is lower. At standard atmospheric pressure (760 mm of mercury) the b.p. of water is 100°C; alcohol 78·4°C; ether 35·6°C.

Bonobo, or pygmy chimpanzee, is man's closest relative (sharing 98% of DNA). It lives in forests south of the Congo river. Some of its communication sounds resemble those of human babies. It is at home foraging in water.

Book of Deer, the oldest (10th century) surviving Scottish manuscript with the earliest known examples of written Gaelic.

Book of Hours, the most widespread devotional work of the Middle Ages. Most surviving copies are 15th century, but the earliest (the de Brailes Hours) dates from *c.* 1240.

Books, Classification of. All libraries are classified to facilitate reference, but the favourite system is the Dewey Decimal System, which divides the whole field of knowledge into ten Main Classes. Each of these Main Classes is again subdivided into ten main divisions. As an example: the main class of Sociology receives the number 300. This range 300 to 400 (the next main class) is graduated into tens, and Economics is 330. The range 330 to 340 is again graduated, and the subject of Labour and Capital is 331. This process is carried on by decimals so that 331·2 deals with Remuneration for Work, 331·22 with Wage Scales *etc.*

Borax (**Sodium Pyroborate**) is a white, soluble, crystalline salt. It is widely and diversely used, *e.g.*, as a mild antiseptic, in glazing pottery, in soldering, in the making of pyrex glass, as a cleansing agent and sometimes as a food preservative. Borax occurs naturally in the salt lakes of Tibet, where it is called tincal.

Bore. An almost vertical wall of water which passes upstream along certain estuaries. Its formation requires special conditions of river flow, incoming high tide, and shape of river channel. It can be spectacular and dangerous.

In Britain the best known is the Severn bore which can be over a metre high and move at 16–19 km/h. It occurs around 12 times a year. In parts of Britain the bore is called an eagre. There are *c.* 60 bores in the world.

Boron. A metalloid element, no. 5, symbol B. There are two forms, one crystalline, the other amorphous. It is not very abundant in nature but occurs in concentrated deposits. It is best known in boric acid, which is used as a mild antiseptic (called boracic acid) and borax (*q.v.*). Boron compounds are essential to some plants, *e.g.*, beans. Used in the preparation of various special-purpose alloys, such as impact resistant steel. Compounds of boron and hydrogen are used as rocket fuels.

Borstal, an institution where young offenders under 21 on conviction were sent for detention and reform. The first was opened in 1902 at Borstal, near Rochester in Kent. Borstals were abolished by the 1982 Criminal Justice Act.

Bourgeoisie, a term used by Marxists to indicate those who do not, like the proletariat, live by the sale of their labour. They include, on the one hand, industrialists and financiers or members of the liberal professions and, on the other, small artisans and shop-keepers.

Bovine Spongiform Encephalopathy (**BSE**). *See under* **Mad Cow Disease**.

Bow, an instrument for propelling arrows, and, in the days when it was a weapon of war, was usually made of yew or ash, and was about 2 m long, with an arrow *c.* 1 m long. It was the weapon with which Crécy, Poitiers and Agincourt were won. The cross-bow was Italian and was adopted in France, but did not become popular in Britain.

Bow Bells is the peal of the London church of St. Mary-le-Bow, Cheapside, within sound of which one must be born to be entitled to be called a "cockney". Bow Bells had not been heard since 1939, but they once again rang out over the City of London on 20 December 1961.

Bowdlerise, to expurgate a book. Derived from Thomas Bowdler (1754–1825), the editor of the Family Shakespeare, in which he edited out some words. His prudery met with ridicule and hence the words "bowdlerism" "bowdlerist", *etc.*

Bower Bird, native to Australia and New Guinea and related to the Bird of Paradise, though often less striking in appearance. In the mating season the male builds a "bower" of sticks and grasses for elaborate courtship displays.

The Gardener Bower Bird of Papua makes a lawn in front of his bower and adorns it with bright coloured pebbles and flowers which are replaced as they wither. The female builds her nest away from the bower. So far, 18 species of bower bird have been identified.

Boxgrove. Site near Halnaker, West Sussex. In 1993 archaeologists found the 500,000 year old left shin bone of "Boxgrove Man", making it the site of the oldest human inhabitant in England.

Boy Scouts. Movement founded by Lord Baden-Powell in 1907, now with over 28 million members. Baden-Powell's book *Scouting for Boys* was published in 2008. The Girl Guides (renamed Girlguiding in 2002) were founded in 1910 by Agnes Baden-Powell. Scouts (and Guides) now offer an oath of allegiance that does not require a pledge of allegiance to God. One in four Scouts in the UK are now girls.

Boycott, a term used in connection with a person that the general body of people, or a party or society, refuse to have dealings with. Originally used when Captain Boycott (1832–97) was made the victim of a conspiracy by the Irish Land League which prevented him making any purchases or holding any social intercourse in his district. He had incurred the League's hostility by a number of evictions.

Bramley Apples actually take their name from a cottage owner in Southwell, Nottinghamshire.The name now has protected status.

Brass, an exceedingly useful alloy of copper and zinc. Much brass is about two-thirds copper but different proportions give different properties. It is harder than copper and easily worked. Brass in the Bible probably refers to bronze.

Breadfruit Tree (*Artocarpus altilis*), a native of the South Sea Islands; the fruits are a brownish green, about the size of a melon, and contain a white pulpy substance which is roasted before being eaten. The tree grows 12 m or more. Captain Bligh's ship *Bounty* was on a voyage to Jamaica carrying a cargo of 1,000 breadfruit trees when the mutiny occurred.

Breeder Reactor, a kind of nuclear reactor (*q.v.*) which besides producing energy by the fission process also produces ("breeds") more nuclear fuel at the same time. A typical reaction is: a neutron induces fission of a U-235 nucleus which breaks up into two medium-sized nuclei and some neutrons; one of the latter then enters a U-238 nucleus turning it into U-239 which then decays radioactively *via* neptunium into plutonium which is useful fuel. There are technical problems in breeder reactors which have delayed their practical use.

Breviary (Lat. *breviarium* = abridgment), the short prayer-book of the Roman Catholic Church which gives the Divine Office, *i.e.*, the services to be said daily. The directions for Mass are in the Missal. The current Roman breviary is a simplified version of the one decreed by the Council of Trent, 1568. *See also* **Matins.**

Bridges are structures for continuing a road, railway, or canal across a river, valley, ravine, or a road or railway at a lower level. From early times bridges were made of timber, stone, or brick, and it was not until the 19th cent. that wrought- and cast-iron were used. Today the materials mostly used are steel and reinforced concrete. Among the most famous of ancient bridges is that of S. Angelo at Rome, built by Hadrian as the Pons Aelius, A.D. 134. The Rialto bridge at Venice dates from 1588. The Ponte Santa Trinita at Florence, one of the finest Renaissance bridges and deemed the most beautiful in the world, was destroyed by German mines in 1944 but has now been reconstructed just as it was before. The first stone bridge across the Thames was begun in 1176. It had 19 arches and was lined with houses and stood until 1831 when it was replaced by the granite bridge designed by Sir John Rennie which stood until 1972. This has been replaced by a three-span concrete bridge with a six-lane carriageway and two footways.

The first cast-iron bridge was built by Abraham Darby at Coalbrookdale, Shropshire, in 1779. Telford's Menai suspension bridge (1825) has since been enlarged, the original design maintained. Robert Stephenson's tubular bridge across the Menai Straits (1850) was the prototype of all modern plate girder railway bridges.

Other bridges are the Niagara (suspension), Forth railway bridge (cantilever), London Tower bridge (suspension), Tay railway bridge, Victoria Jubilee bridge across the St. Lawrence at Montreal (an open steel structure), Sydney Harbour bridge, Lower Zambesi bridge, Storstrom bridge in Denmark, Auckland Harbour bridge, and Verrazano-Narrows bridge spanning New York's harbour from Brooklyn to Staten I., exceeding by 18 m the centre span of San Francisco's Golden Gate bridge.

Work on a suspension bridge 2-miles long, linking Italy and Sicily, should begin in the near future. Europe's longest road and rail bridge (opened in July 2000) is the Öresund Bridge, which links middle Denmark and southern Sweden. The longest suspension bridge in the world links Hong Kong to its new airport. Europe's longest suspension bridge (opened in 1998) links the Danish island of Sjaelland (on which Copenhagen stands) to Funen. In 2007 Egypt and Saudi Arabia planned to build a bridge across the Gulf of Aqaba, linking Africa and Arabia. China now has 9 of the world's 12 longest bridges. (including a 34 mile bridge linking Hong Kong, Macau and Zhuhai)

British bridges include the road suspension bridge across the Firth of Forth, completed 1964, the Severn suspension bridge (from which the design principles for the new bridge across the Bosporus were taken) and the Tay road bridge, both completed 1966, and the Humber suspension bridge, linking Hull and Grimsby, opened in 1981. When completed, it was the longest single- span suspension bridge in the world (1,410 m). The M25 "Dartford" bridge (opened 1991) is the largest cable-stayed bridge in Europe.

The second Severn bridge, which opened in June 1996 is the longest in Britain. The proposed New Wear Crossing (in the Sunderland Strategic Transport Corridor) will be the tallest in England. The new Queensferry Crossing is the tallest bridge in the UK.

Europe's highest road bridge (the Millau viaduct over the River Tarn in the Massif Central) was opened in 2004. It is 343m (1,125ft) tall and 2·4km (1·5 miles) long. The world's highest bridges are now in China. *See also* **Bailey Bridge**.

Bridleway. In English law a highway over which the public have the following, but no other, rights of way: that is to say, a right of way on foot and a right of way on horseback or leading a horse, with or without a right to drive animals of any description along the highway.

Britannia Metal, an alloy of tin, antimony and copper, harder than pure tin, corrosion-resistant, used for teapots, jugs (often electro-plated).

British Association for the Advancement of Science, The, was founded in 1831 by a group of British scientists under Charles Babbage (1792–1871) to stimulate scientific inquiry.

British Commonwealth. The Commonwealth is a free association of independent member nations and their dependencies. The political status of the member nations is clarified and given legal substance in the *Statute of Westminster* drawn up in 1931, before the Commonwealth was founded, by the United Kingdom and the Dominions. The original Dominions were Australia, Canada, Irish Free State, Newfoundland, New Zealand and South Africa. On 1 June 1994, South Africa rejoined the Commonwealth, having left in 1961. In 1995 Cameroon and Mozambique joined the Commonwealth (and Rwanda in 2009). *See* **D24**.

British Legion. *See* **Royal British Legion**.

British Library *See* **Libraries, L66.**

British Museum, was created by an Act of Parliament in 1753, when the Sir Hans Sloane collection, which the British Government had acquired for £20,000, was added to the Cottonian Library and the Harleian Manuscripts. It was opened to the public in 1759 at Montague House Bloomsbury. The acquisition of the library of George III (known as the King's Library) in 1823 led to the construction of the present building with the new wing (1829), quadrangle (1852), domed reading room (1857), and later additions. The books and the reading room are now part of the British Library (*see also under* **Libraries**). The Natural History Department was transferred to South Kensington in the 1880s. As a museum it is perhaps the most famous in the world with its priceless collections. Its treasures include the Elgin Marbles (*q.v.*), the Rosetta Stone (*q.v.*) and the Portland Vase (*q.v.*). The famous domed Reading Room closed in 1997. It is the second most popular cultural institution in the world (after the Louvre in Paris). It attracts around 6·8 million visitors annually.

British Standard Time, The British Standard Time Act of 1968 put Britain an hour ahead of Greenwich Mean Time (GMT) throughout the year for an experimental 3 years. This brought Britain into line with countries in Western Europe where Central European Time is observed. In 1970 Parliament called for the restoration of the previous position—BST in the summer months and GMT in the winter—as from 31 October 1971.

Attempts to change the law once again to give lighter evenings (but darker mornings) have gained much public support in recent years.

Brittle Stars, organisms resembling starfish. They use their arms (instead of tube feet) to move. They hide in coral crevices, emerging at night to feed.

Brocken-spectre or Glory. The series of coloured rings which an observer sees around the shadow of his own head (or an aeroplane in which he is travelling) as cast upon a bank of mist or thin cloud. This effect is produced by reflection and refraction of sunlight in minute water-droplets in the air just as in a rainbow.

Bromine. A non-metal element, no. 35, symbol Br, member of the halogen family (*q.v.*). It is a red, evil-smelling liquid (Greek *bromos*, a stink). It is an abundant element. In the USA bromine is extracted from sea-water on a large scale. It unites readily with many other elements, the products being termed bromides. Its derivatives with organic compounds are used in synthetic chemistry. Bromoform is a liquid resembling chloroform. Bromides were formerly used extensively in medicine to calm excitement.

Bronze is primarily an alloy of copper and tin, and was one of the earliest alloys known. The Bronze Age (began c. 4,000 B.C. in Middle East) in the evolution of tool-using man came before the Iron Age (*c.* 2,000 B.C.) Some modern bronzes contain zinc or lead also, and a trace of phosphorus is present in "Phosphor-bronze". Major Bronze Age (2,700–700 B.C.) sites in Britain are Stonehenge and the Avebury Stone Circle (both in Wiltshire).

BSE. *See* **Mad Cow Disease**.

Bubble Chamber. An instrument used by physicists to reveal the tracks of fast fundamental particles (*e.g.*, those produced in large accelerating machines) in a form suitable for photography; closely related to the Wilson cloud chamber (*q.v.*), but the particles leave trails of small bubbles in a superheated liquid (often liquid hydrogen) instead of droplets of liquid in a supersaturated gas.

Buckingham Palace, London residence of British sovereigns since 1837. Originally built for the Duke of Buckingham (1703); bought by George III in 1762 and remodelled by Nash 1825–36.

Buntings, name of a group of finches, seed-eating birds, usually found in open country. The Yellowhammer, Reed Bunting, Corn Bunting and Cirl Bunting are resident in Britain; the Snow Bunting (which breeds in small numbers in Scotland) and Lapland Bunting are regular winter visitors. The Ortolan is a rare visitor.

Burbot, also known as fresh-water cod or eelpout, is the only freshwater fish to have died out in Britain in the last 100 years.

Burka, the Muslim headscarf or veil.

Bustard, type of bird, related to the crane. The great bustard (the heaviest flying bird in the world) is being reintroduced into Britain after an absence of 200 years. Its first three chicks were hatched in 2009. The great bustard is the county bird of Wiltshire. It had been hunted to extinction in Britain. The last great bustard in the UK was shot in 1832 by a vicar.

Butane, a colourless inflammable gas made of carbon and hydrogen; formula C_4H_{10}. Found in natural gas and made as a by-product of oil refining.

Butane, like propane (*q.v.*), can easily be liquefied and moved safely in cans and tanks. It is thus useful as a "portable gas supply"; also used in internal combustion fuels.

Butterflies, like moths belong to the order *Lepidoptera*. There are *c.* 20,000 species (though many are in decline). There are four stages in the evolution of a butterfly: *egg*, *caterpillar*, *pupa* and *adult butterfly*. They are now known to have a geomagnetic compass.

The world's largest sanctuary for butterflies (Butterfly World) has been opened near St. Albans to help stem the decline of Britain's surviving 56 resident species (5 have died out over the last 100 years). Some butterflies are migrating from Europe to Britain because of climate change.

Buzzard, magnificent dark brown birds, three feet long, with an eye as large as a human eye. They need woods to nest in and land to forage over. In the 19th century they were hunted almost to extinction by landowners.

C

Cacao, Theobroma cacao, is an evergreen tree, from 4–6 m high, growing abundantly in tropical America, West Africa, the Caribbean, Sri Lanka, *etc.*, yielding seeds, called cocoa beans from which cocoa and chocolate are manufactured. The fruit is 17–25 cm long, hard and ridged; inside are the beans, covered with a reddish-brown skin, which are first fermented, then dried. The trees mature at five to eight years and produce two crops a year. Chocolate was first introduced to England around 1652. The Englishman, Joseph Fry, created the first chocolate bar in 1847, but *c.* 3,500 years earlier the Mayas of central America drank *cacao*. Ivory Coast is the major producer. There is concern that surging demand in India and China, plus droughts and diseases, will lead to a worldwide shortage.

Cactus, a family of flowering plants numbering about 1,480 species adapted to living in very dry situations. The stem is usually fleshy, being composed of succulent tissue, remarkably retentive of water; commonly equipped with sharp thorns which deter animals from eating them. The roots are generally very long, tapping soil water over a large area; a "prickly pear" cactus may have roots covering a circular area 7 m or more in diameter. The leaves are commonly insignificant or absent, and the stem takes over the photosynthetic leaf function and becomes accordingly flattened to expose greater area to sunlight and air. In some kinds of cactus (*e.g.*, *Echinocactus*) the stem is shaped almost like a sea-urchin. Many species are now threatened with extinction. Some giant cactuses can live up to 200 years.

Cadmium. A metallic element, no. 48, symbol Cd, chemically similar to zinc and mercury. Used in alloys to lower the melting point, as in Wood's metal with bismuth and tin. Alloyed with copper to make electric cables. Like zinc, it is a protective metal and is used in electroplating. The cadmium-vapour lamp gives a characteristic frequency used in measuring wavelength.

Caesium, also spelt **Cesium,** is an alkali metal element, no. 55, symbol Cs, in first group of the periodic table. It resembles rubidium and potassium and was discovered by Bunsen and Kirchoff in 1860. It was the first element whose existence was discovered spectro-scopically. The caesium atom consists of a heavy nucleus surrounded by 55 electrons, 54 of which are arranged in stable orbits, and one of which, known as the valency electron, is in a less stable orbit surrounding them. Used in the construction of photo-electric cells and as an accurate time standard (atomic clock).

Cajuns, corruption of Acadians. French-speaking inhabitants of Louisiana, descended from French Canadians who emigrated from Nova Scotia.

Calcium, a silvery-white metallic element, no. 20, symbol Ca. It melts at 810°C and is very reactive. It was discovered by Sir Humphry Davy in 1808, but not until 1898 was it obtained pure, by Moissan. Does not occur as metal in nature, but calcium compounds make up a large part of the earth's crust. Most important calcium sources are marble, limestone, chalk (all three are, chemically, calcium carbonate); dolomite, which is the double carbonate of calcium and magnesium; gypsum, a hydrated calcium sulphate; calcium phosphate and calcium fluoride. Igneous rocks contain much calcium silicate.

Calcium compounds are essential to plants and are used in fertilisers. Animals require calcium and phosphorus for bone and teeth formation; deficiency is treated by administration of calcium phosphate. Strontium is chemically similar to calcium, and the radioactive strontium 90 from atomic "fall-out" is easily assimilated by the body.

Calcium is the most abundant metallic element in the human body.

Calendar, a collection of tables showing the days and months of the year, astronomical recurrences, chronological references, *etc.* The Julian Calendar, with its leap year, introduced by Julius Caesar, fixed the average length of the year at 365¼ days, which was about 11 minutes too long (the earth completes its orbit in 365 days 5 hours 48 minutes 46 seconds of mean solar time). The cumulative error was rectified by the Gregorian Calendar, introduced in Italy in 1582, whereby century years do not count as leap years unless divisible by 400. This is the the rule we now follow. England did not adopt the reformed calendar until 1752, when she found herself 11 days behind the Continent. Until then, New Year's Day in England was on 25 March. Hence, in 1752, after the 11 days had been rectified, the new financial year began on 6 April—as it still does!

The Gregorian Calendar did not come into use in Russia until 1918. Old Style and New Style dates are classed as "O.S." "N.S.".

The Chinese Lunar Calendar is based on cycles of the moon (hence Chinese New Year can fall anytime between late January and mid-February). Chinese New Year traditionally lasts for 15 days. *See also* **G25.**

Calends, the first day of the month in Roman times.

Callisto. A moon of Jupiter with a subsurface ocean. Callisto is larger than the planet Mercury.

Calorie. Unit of quantity of heat. The "small" or fundamental calorie is the amount of heat required to raise the temperature of 1 gram of water from 14·5° to 15·5°C and is equal to 4·185 joules. This is the gram-calorie used in physics and chemistry. The large Calorie (written with a capital C), commonly used in nutritional connotations, is equal to 1000 small calories and is called the kilogram-calorie.

Cambridge University had a sufficiently good teaching reputation to attract Oxford students in 1209, when lectures at their own university were suspended. In 1226 it had a Chancellor who was recognised by King and Pope. The first college to be founded was Peterhouse in 1284.

The university was reorganised and granted a Charter of Incorporation by an act of 1571. The colleges with their dates of foundation are Christ's (1505), Churchill (1960), Clare (1326), Clare Hall

(1966), Corpus Christi (1352), Darwin (1964), Downing (1800), Emmanuel (1584), Fitzwilliam (1966), Gonville and Caius (1348), Jesus (1496), King's (1441), Magdalene (1542), Pembroke (1347), Peterhouse (1284), Queens' (1448), Robinson (1977) St. Catharine's (1473), St. Edmund's (1896), St. John's (1511), Selwyn (1882), Sidney Sussex (1596), Trinity (1546), Trinity Hall (1350) and Wolfson (1965). (Wolfson was the first College to admit both men and women as students and Fellows).

The women's colleges to emerge were: Girton (1869), Newnham (1871), New Hall (1954) (now renamed Murray Edwards College) and Hughes Hall (formerly Cambridge T. C.) (1885) (a full member in 2006). Lucy Cavendish College (1965) received full college status in 1997. Homerton (f. 1824) became a full Cambridge college in March 2010.

Women were admitted to degrees (but not allowed to sit for examination) in 1920, and to full membership of the University in 1948. Newnham and New Hall still remain as all-women colleges.

Camel, a large ruminant quadruped, inhabiting Asia and Africa, where it is largely used as a beast of burden. There are two species—the *Arabian* camel or dromedary, with only one hump; and the *Bactrian*, or double-humped camel. There are no wild dromedaries, and the only wild bactrians occur in the Gobi Desert. The camel is able to go for long periods without water, not, as was formerly believed, because it stored water in its hump, but because of the unique mechanism of its physiology which enables it to conserve water at the expense of not sweating until 40°C is reached. Female camels are known as she-camels. In Australia, there are more than 750,000 camels in the vast interior. Millions of years ago, camels lived in the forests deep in the Arctic Circle. There were no camels in Biblical times (despite the assertion of the Bible). Camels can run as fast as thoroughbred horses.

Campanile, or bell-tower, is separate from but usually adjoining its parent church. The most famous are in Italy. Giotto's tower at Florence, adjoining the cathedral of Santa Maria del Fiore, is architecturally the finest in the world. Others are at Cremona, the loftiest in Italy (110 m) and Pisa (the leaning tower). The magnificent pointed campanile of St. Mark's, Venice, which collapsed in 1902 (and since rebuilt in its original form), was begun in 902.

Canal, an artificial watercourse used for navigation which changes its level by means of locks. The completion of the Bridgewater Canal in 1761 to take coal from Worsley to Manchester marked the beginning of canal building in industrial Britain.

There are over 4,000 km of navigable inland waterways in the UK today, *c.* 3,200 km of which are under the control of the new Canal and River Trust (which replaced British Waterways in 2012). The English network is based on the four great estuaries, Mersey, Humber, Severn and Thames.

Canal building gave rise to the new discipline of civil engineering.

Cancer, Tropic of. *See* **Tropics, L110**.

Candela unit of luminous intensity, symbol cd. An idea of the value which this unit represents may be gained from the fact that light obtained from a 40 W filament-type electric lamp or bulb is approximately the same as would be given by a point source of luminous intensity 30 cd. *See* **SI units, Section T.**

Candlemas, the halfway point between the winter solstice and the spring equinox.

Candy Floss (known in America as cotton candy). Made entirely from sugar. It was invented in 1897.

Cannabis, a bushy plant found wild in many parts of the world. Cannabis was reclassified from a Class B to a Class C drug in 2004. From January 2009 it reverted to a Class B drug (users caught with it 3 times will be arrested). Using cannabis can lead to future mental health problems (although it has been used medicinally in China and India for a long time). Uruguay has introduced a legal, national market in cannabis and Jamaica has decriminalised its use. Alaska, Oregon, Colorado, Washington State and the District of Columbia now allow possession of small amounts. Synthetic cannabis is known as 'spice' or black mamba. New approaches to legalise use of the drug are being urged.

Canonical Hours, seven in number in the Western Church; Matins and Lauds, before dawn; Prime, early morning service; Terce, 9 a.m.; Sext, noon; Nones, 3 p.m.; Vespers, 4 p.m.; Compline, bed-time.

Canonisation, the entering of one of the faithful departed on the list of saints of the Roman Catholic Church. The rules governing canonisation were simplified by papal decree in 1969. Beatification, by which a person is called blessed, is usually followed by canonisation.

Canticles, the name given to the scriptural passages from the Bible sung by the congregation in the various Christian liturgies. They are the *Benedicite, Benedictus, Magnificat, Nunc Dimittis.*

Capercaillie, the largest of the grouse family, found in the Scottish highlands and the pine forests and mountainous regions of Northern and Central Europe and Asia. The bird was reintroduced to Scotland by Sir Thomas Buxton in 1830.

Capital Punishment. *See* **Death Penalty, L30**.

Capricorn, Tropic of. *See* **Tropics, L110**.

Capuchins are members of a mendicant order of Franciscans, founded in the 16th cent. with the aim of restoring the primitive and stricter observance of the rule of St. Francis, so called from the capuce (pointed cowl) worn by them.

Capybara, a cousin of the guinea pig, found in South America. It is the largest rodent in the world.

Caracals, the largest of the African small cats.

Carat, a term used in assessing the value of gold and precious stones. In connection with gold, it represents the proportion of pure gold contained in any gold alloy, and for this purpose the metal is divided into 24 parts. Thus 24-carat indicates pure gold, and any lesser number of carats shows the proportion of gold contained in the alloy. The carat as a measure of weight is now obsolete, having been replaced by the *metric carat* of 0·2 grams.

Caravan, a band of travellers or traders who journeyed together for safety across the deserts, sometimes numbering many hundreds. The great caravan routes from Egypt to Babylon and from Palestine to Yemen linked up with the Syrian ports and so with Western sea commerce.

Carbon, a non-metallic chemical element no. 6, symbol C, which occurs in crystalline form as diamonds and graphite; amorphous forms of carbon include charcoal and soot, while coke consists mainly of elementary carbon. The biochemistry of plants and animals largely hinges upon carbon compounds. The study of carbon compounds is called Organic Chemistry.

Carbon 14. A radioactive isotope of carbon, discovered in 1940, with a half-life *c.* 6,000 years, used in following the path of compounds and their assimilation in the body. Also used in determination of the age of carbon-containing materials such as trees.

Carbon Dioxide. Commonest of the oxides of carbon. It is formed when carbon and its compounds are burnt with abundant supply of air, and when carbon compounds are oxidised in the respiration process of animals. The atmosphere contains carbon dioxide to the extent of about 325 ppm and is increasing by about 1 ppm per year, principally because of the burning of fossil fuels and possibly because of deforestation which not only leaves more oxidisible material but lowers the amount of carbon dioxide removed by photosynthesis.

Carbon Monoxide is a colourless gas with no taste or smell. It is formed when coal and coke are burnt with a restricted supply of air; the blue flame to be seen in a coke brazier, for instance, is the flame of carbon monoxide. This gas is very poisonous, forming with the haemoglobin of the blood a compound which is useless for respiration and cherry red in colour, which gives a visible sympton of poisoning by carbon monoxide. With nickel it forms a volatile compound, called nickel carbonyl, and this reaction is the basis of the Mond process for extracting nickel.

Cardinal, one of the chief dignitaries of the Roman Catholic Church who constitute the Pope's council, or Sacred College, and when the papal chair is vacant elect by secret ballot a Pope from among themselves. There are three orders: cardinal bishops, members of the Roman Curia (the central administration of the Church) and bishops of sees near Rome; cardinal deacons, also members of the Curia, holding titular bishoprics; and cardinal priests who exercise pastoral duties over sees removed from Rome, though some are members of the Curia.

After the surprise resignation in 2013 of Pope Benedict XVI (the first resignation in the modern era), the College of Cardinals comprised 115 members (under 80) eligible to elect the new Pope.

Papal insignia were trimmed of embellishment by papal decree in 1969 with the abolition, subsequently revoked, of the famous red hat (the *galero*) and the shoes with buckles. Cardinals aged 80 and over may not enter a conclave to elect a pope. There are now around 225 cardinals. For the first time ever, most cardinals now come from outside Europe.

Cardinal Virtues, according to Plato these were justice, prudence, temperance, fortitude—*natural* virtues unlike the *theological* virtues of the Catholic Church, faith, hope, charity.

Caribou, reindeer (*q.v.*) of N. America.

Carmelites, a body of mendicant friars taking their name from Mount Carmel, where the order was first established in the 12th cent. The original rule of the order required absolute poverty, abstinence from meat and a hermit life. The rigidity of the rule of the order was mitigated by Innocent IV. They wear a brown habit with white mantle, hence their name of White Friars. The order of Carmelite nuns was instituted in the 15th cent.

Carmine. *See* **Cochineal.**

Carp, a well-known fresh-water fish, found in plenty in most European and Asiatic still waters; reaches a length of about 60 cm and under favourable conditions lives for about 40 years. Familiar British members of the family are the roach, rudd, dace, chub, gudgeon, tench, minnow, barbel, bream and bleak.

The goldfish, popular in ornamental ponds, is the domesticated variety of Asian origin.

Carthusians, an order of monks founded in 1084 by St. Bruno at the Grande Chartreuse near Grenoble, and introduced into England about a century later. They built the Charterhouse (corruption of Chartreuse) in London in 1371.

The chief characteristics of the order are a separate dwelling-house in the precincts of the charterhouse for each monk, and the general assembly in the Church twice in the day and once at night. They wear a white habit, with white scapular and hood. The liqueur *Chartreuse* was invented by the order and is still their valuable secret.

Casein, the chief protein in milk and cheese. It is coagulated by the action of rennet or acid. An important class of plastics ("casein plastics") are produced from it, and these plastics are converted into buttons, kitting-needles, *etc.* 36,000 litres of milk yield about 1 tonne of casein.

Cassowary, a genus of ostrich-like birds which, together with the emu, forms a separate order found only in Australasia. All three species are black, with brightly coloured necks, and with a horny crest on the head. Noted for fleetness and their ferocious kick.

Castor-oil Plant (*Ricinus communis*), an African shrub now cultivated in most tropical countries. It has broad palmate leaves and bears a spiny fruit containing seeds which when pressed yield the well-known oil.

Cat, general name for all 37 members of the class *Felidae* of the carnivorous order, from the lion down to the domestic cat. The latter is believed to be descended from the European and African wild cats. Egypt first domesticated the cat.

Members of the cat family include tigers, lions, cheetahs, jaguars, pumas, leopards *etc.* The world's rarest big cat is the Amur leopard, whilst there only 200 Arabian leopards left in the wild.

Catabolism, Anabolism, are the terms used to describe the two types of metabolic pathway. Catabolic pathways are routes by which large organic molecules are broken up by enzymes into their simpler constituents *e.g.*, starch into glucose. The anabolic pathways are the routes by which complex molecules are synthesised from simple subunits, *e.g.*, proteins from amino acids.

Catacombs, caves or tunnels used as burial places, especially by early Christians and Jews. The coffins were stacked on shelves in vaults or niches.

Catalyst. A substance which alters the rate of reaction without itself being chemically changed. Various aluminium and titanium compounds are catalysts in the formation of polythene from ethylene. Palladium catalyses the reaction of hydrogen with oxygen (hence its use in gas lighters). Enzymes in the body hasten the breakdown of carbohydrates and proteins by catalytic action. *See also* **Section T.**

Cataracts are huge waterfalls. The most famous are Niagara in North America, the Orinoco in South America, the Victoria Falls on the Zambesi, and the Rhine Falls at Schaffhausen.

Caterpillar, the larva of a butterfly or moth, worm-like in its segmented body, with 3 pairs of jointed true legs, often curiously marked and coloured, and frequently more or less hairy. The world's first amphibious caterpillars were discovered in Hawaii in 2010.

Cathedral, the chief church of a diocese, so called from its containing a Bishop's seat, or episcopal chair. Some celebrated cathedrals are St. John Lateran of Rome, Notre Dame of Paris, the cathedrals of Cologne and Milan, St. Paul's in London, Canterbury, York Minster, and the cathedrals of Durham, Norwich and Winchester.

Cat's eye, a kind of quartz, much valued as a gem, opalescent, and of various shades. For long used in roads to mark guidelines for motorists, but now replaced by solar-powered studs.

Cave Art. *See* **N5.**

Caves, natural hollow places in the earth, frequently found in Carboniferous limestone areas. The underground caves are formed by the action of rainwater carrying carbon dioxide, a dilute acid which slowly attacks the limestone rocks. Caves still remain the least explored places on earth! The world's largest cave passage was discovered in 2009 in the Vietnamese jungle.

The main caves in the British Isles are in the Mendips, Derbyshire, Yorkshire, South Wales and in County Clare. Many British inland caves are thought to have been formed at the end of the Ice Age when the water table rose. Britain's largest known underground chamber is the Frozen Deep, below Cheddar Gorge in Somerset.

The study of caves is known as spelaeology.

Caviar. *See under* **Sturgeon.**

Cedar, a dark-leaved, cone-bearing, horizontal-branched evergreen tree that grows to a considerable height and girth, the best known species in Britain being the Cedar of Lebanon, which was introduced in the 17th cent. The Egyptians used the resin of the Lebanese cedar to mummify their dead, whilst the Phoenicians built their ships from its timber. The Atlas Mountains Cedar is now under serious threat.

Celestial Sphere. The sky seen as an imaginary sphere that surrounds the earth. A fundamental tool in positional astronomy, it provides a surface on which to draw and study planetary movements *etc.*

Celluloid, one of the first synthetic thermoplastic materials, discovered by Alexander Parkes in 1865 when he was attempting to produce synthetic horn. It is made by treating cellulose nitrate with camphor and alcohol.

Photographic film is made of a similar, but less-inflammable material, formed by the use of cellulose acetate instead of the nitrate.

Cellulose, a carbohydrate, and a constituent of nearly all plants. Cellulose occurs in an almost pure state in the fibres of linen (flax), absorbent cotton, jute, and filter-paper.

Celsius was the 18th cent. Swedish scientist after whom the modern Celsius temperature scale is named. Since 1954, °C stands for "degree Celsius" instead of "degree Centigrade" but this is only a change in name. Both symbols refer to the temperature scale which calls the melting point of ice 0°C and the boiling point of water at one atmosphere pressure 100°C. *See* **Absolute Temperature.**

Celts, an ancient race originating in the third millennium B.C. in the Alps, united by a common language and culture, who spread westward into Spain, northward into Britain, eastward to the Black Sea, reaching Galatia in Asia Minor. More recent research now suggests they spread from West to East. The "La Tène" iron-age Celts invaded Britain *c.* 250 B.C. After Britain was conquered by the Romans and invaded by the Angles and Saxons there remained as areas of Celtic speech only Wales (Brythonic speakers), Ireland, Scotland, the Isle of Man (Gaelic speakers), and Cornwall. The late Celtic period in Britain produced a distinctive Christian art (*e.g.*, the Lindisfarne Gospel *c.* 700, and the Irish Book of Kells).

Surviving Celtic languages are Welsh, Irish, Breton, Scots Gaelic and a tiny Cornish tradition. Manx Gaelic is on the point of extinction. DNA analysis has shown that our indigenous Celts are descended from tribes of Spanish fishermen.

Centrifuge, a machine which produces large accelerations by utilising the radial force caused by rotating a body about a fixed centre. Centrifuges have found extensive application in modern science. They can be used for the separation of one size of particle from another in biochemistry or in the training of astronauts where the accelerations occurring during rocket lift off can be simulated in a centrifuge on the ground.

Ceramics, are substances in which a combination of one or more metals with oxygen confers special and valuable properties. These include hardness, and resistance to heat and chemicals. Ceramic comes from the Greeek word for pottery, and pottery materials of mud and clay were probably the first man-made ceramics. Nowadays the range is enormous and growing; apart from all the pottery materials, there are firebricks, gems, glasses, concretes, nuclear reactor fuel elements, special materials for electronic devices, coloured pigments, electrical insulators, abrasives, and many other things. The scientific study of ceramics is part of materials science (*q.v.*).

Ceres, the largest object in the asteroid belt between Mars and Jupiter. Discovered in 1801. A dwarf planet. Visited in 2011 by the Dawn probe. which is now in orbit around it.

Cerium, a scarce metallic element, no. 58, symbol Ce, discovered by Berzelius in 1803. A mixture of cerium and thorium nitrates is used in the manufacture of gas mantles, which owe their incandescent property to the deposit of cerium and thorium oxide with which they are coated.

CERN, French acronym for the European Laboratory for Particle Physics in Geneva. In 1989, the Large Electron Positron collider (LEP) was opened there. A long-awaited attempt to recreate the swirl of matter just after the "Big Bang" created the universe is now underway. It has resulted in the creation of a 'mini Big Bang' generating temperatures of 10 trillion degrees centigrade – melting even protons and neutrons. An even bigger machine is planned – the International Linear Collider. This will smash electrons into their antimatter eqvalent – positrons. *See also* **Higgs Boson.**

Chaffinch. *See* **Finch, L40.**

Chalcedony, a mixture of crystalline silica and amorphous hydrated silica, *i.e.*, of quartz and opal. It has a waxy lustre, and is much used by jewellers for necklaces, bracelets, *etc.* Commonly it is white or creamy. Its bright orange-red variety is called carnelian; its brown variety, sard. Chrysoprase, plasma and bloodstone are varieties which are respectively pale apple-green, dark leek-green and green with red spots.

Chalk, a white limestone, calcium carbonate, found in the Upper Cretaceous deposits (formed from the shells of minute marine organisms). As chalk is porous, few streams form on its surface and consequently it is eroded slowly, although generally speaking it is a soft rock. Its juxtaposition with soft impervious clay in some areas results in its forming steep ridges known as escarpments, *e.g.*, N. and S. Downs and Chilterns. In contrast to the dry upland surfaces of chalk, lower levels are frequently saturated with water which emerges as springs.

Chamberlain, Lord, the senior officer of The Royal Household who is responsible for all ceremonial within the palace, but not the coronation or state opening of parliament. He is also in charge of appointments to The Royal Household. His duty as censor of plays was abolished in 1968.

Chamberlain, Lord Great, one of the great officers of state whose duties are now mainly ceremonial. He attends the monarch at the state opening of parliament and at the coronation and is custodian of the Palace of Westminster (Houses of Parliament). The office is hereditary, dating from Norman times, and is held for one reign in turn by descendants of the De Veres, Earls of Oxford.

Chameleon, a family of lizards with numerous species. Their ability to change colour is well known, but exaggerated, and is due to the movement of pigment cells beneath the skin. They are slow, arboreal, and mainly insectivorous. Found in Africa, India and Arabia.

Chamois, a species of antelope, native of Western Europe and Asia. About the size of a goat, it lives in mountainous regions, and possesses wonderful leaping power, so that it is very difficult to capture. Its flesh is much esteemed, and from its skin chamois leather is made, although today sheep and goat skins are usually substituted. The mating season is October–November and the fawns are born in May or June. Live to be 20–25 years old.

Champagne is made from one of three grape varieties *pinot noir*, *pinot meunier* and *chardonnay*. The fizz comes from adding sugar and yeast. It comes from the Champagne district of France (now granted World Heritage status).

Chancellor, Lord, the highest judicial functionary in Britain who also acted until 2006 as Speaker of the House of Lords (There is now a Lord Speaker). The Chancellor is a privy councillor and cabinet minister by virtue of office and was formerly a peer of the realm. Early Lord Chancellors were often ecclesiastics and custodians of the Great Seal. The current Lord Chancellor is Elizabeth Truss, the first-ever woman to hold the post.

Channel Tunnel, a scheme to bore a tunnel through 32–48 km of chalk under the sea between Dover and Calais has been a subject for discussion ever since Albert Mathieu first conceived the idea as a practical possibility in 1802.

The tunnel was officially opened on 6 May 1994, but fare paying passenger services did not start until 14 November 1994.

Chapel Royal, a church dedicated to the use of the Sovereign and Court. They include St. James's Palace, Buckingham Palace, Windsor, Hampton Court, the Tower, and Holyrood.

Charcoal, a term applied to wood that has been subjected to a process of slow smothered combustion. More generally it refers to the carbonaceous remains of vegetable, animal, or combustible mineral substances submitted to a similar process. Charcoal from special woods (in particular buckthorn) is used in making gunpowder. Bone charcoal finds use in sugar refining, as it removes dark colouring matter present in the crude syrup.

Charge-Coupled Device (CCD), a light-sensitive electronic detector, invented in 1970 and now widely used in cameras, hand-held video recorders and in astronomy. CCDs revolutionized astronomy, replacing the photographic plate.

Charon, the largest of Pluto's five known moons, visited by the New Horizons probe in 2015.

Chasuble, a sleeveless vestment worn by ecclesiastics over the alb during Mass.

Cheese, an article of food made from the curd of milk, which is separated from the whey and pressed in moulds and gradually dried. There are about 500 varieties differing with method of preparation and quality of milk. They used to be made in the regions after which they are named but nowadays many of them are mass produced.

Cheeses may be divided into 3 main classes: (1) soft, *e.g.*, Camembert, Cambridge, l'Evêque; (2) blue-veined, *e.g.*, Stilton, Gorgonzola, Roquefort (made from ewe's milk), (3) hard-pressed, *e.g.*, Cheddar, Cheshire, Gruyère, Parmesan, Gouda.

Cheetah or "hunting leopard", the large spotted cat of Africa and Southern Asia, the swiftest four-footed animal alive. The cheetah has now joined the list of endangered species. It became extinct in India in the mid-20th century.

Chelsea Pensioners, the former soldiers (around 440 in all) who live in the Royal Hospital in Chelsea. They wear distinctive red tunics. The first women pensioners moved in during 2009.

Chemical Warfare. This term is usually restricted to mean the use in war of anti-personnel gases, aerosols and smokes, although explosives, napalm, herbicides and defoliants are also chemical agents that are used in war. Poison gas was first used on a large scale in the first world war by Germany in 1915 at the Battle of Ypres. Over 100,000 fatalities resulted from the use of principally chlorine, phosgene and mustard gas.

Worldwide revulsion resulted in the Geneva Protocol of 1925 which prohibited the use of both chemical and bacteriological weapons. It has now been ratified by many nations.

The Protocol has been generally well observed although notable violations have been by the Italians in Abyssinia (1935–36), the Japanese in China during the second world war (when over 100,000 were killed in Zhejiang Province), the Americans in S.E. Asia in the 1960s and Iraq (against the Kurds in the 1980s). Under the 1993 Chemical Weapons Convention (in force since 1997) the signatories are obliged to remove chemical weapons left in other countries. Chemical weapons have been used recently in Syria, Iraq and Sudan.

Chernobyl Disaster Site in the Ukraine of 1986 Soviet nuclear disaster. The scale of the disaster was kept from the Russian people.

Chestnut, the fruit of trees of the genus *Castanea*, members of the family *Fagaceae*. *C. sativa* is the sweet or Spanish chestnut, *C. dentata* the

American chestnut and C. *crenata* the Japanese chestnut. The nut is edible. The wood is used in carpentry and fencing. *See also* **Horse Chestnut.**

Chiltern Hundreds, three hundreds—Stoke, Burnham and Desborough the stewardship of which is now a nominal office under the Chancellor of the Exchequer. Since about 1750 the nomination to it has been used as a method of enabling a member of Parliament to resign his seat on the plea that he holds an office of honour and profit under the crown. An alternate symbolic post is the stewardship of the Manor of Northstead in Yorkshire.

Chimaera, a type of fish (mostly made up of cartilage) related to sharks and rays. They use their long snouts to search the sea floor for their prey.

Chimpanzee, a large anthropoid ape, a native of tropical Africa, of a dark brown colour, with arms reaching to the knee, and capable of walking upright. Its brain is about a third of the weight of the human brain, but is anatomically similar. The animal has considerable intelligence and powers of learning. Chimpanzees have cultures as distinct as those found in human societies. It is now believed that they pass on new customs and technologies socially rather than genetically. The AIDS virus is believed to have come from chimpanzees. There is a 98·5% match between the DNA of chimpanzees and humans. *See also* **Bonobo.**

China Clay. *See* **Kaolin.**

Chinchilla, a South American burrowing rodent. Grey in colour, and white underneath.

Chivalry an international brotherhood of knights formed primarily during the 13th cent. to fight against the Muslims in the Crusades (**E4**). For the French the major battle was against the Muslims in the Holy Land and North Africa, the Spaniards fought the same enemy in their own country, and the Germans were concerned with the heathen of Baltic lands, but Chaucer's "very perfect gentle knight" had fought in all these areas. One did not easily become a knight who had to be of noble birth and then pass through a period of probation, starting as a boy page in the castle of a great lord, serving his elders while he was taught manners, singing *etc.*

Probably he learned Latin, but he certainly learned French, which was the international language of knights as Latin was of scholars. At fourteen he became a squire and learned to fight with sword, battle-axe and lance, and to endure conditions of hard living while carrying out his duties of waiting on his lord, looking after his horses, and in time accompanying him in battle. Only if he showed himself suitable was he finally knighted by a stroke of the hand or sword on the shoulder from the king or lord.

Knighthood was an international order and had its special code of behaviour; to honour one's sworn word, to protect the weak, to respect women, and defend the Faith.

Chlorine, a gaseous element, no. 17, symbol Cl, of the halogen family, first isolated in 1774 by Scheele by the action of manganese dioxide in hydrochloric acid. It unites easily with many other elements, the compounds resulting being termed chlorides. The gaseous element is greenish-yellow, with a pungent odour. It is a suffocating gas, injuring the lungs at a concentration as low as 1 part in 50,000, and was used during the first world war as a poison gas. It has a powerful bleaching action, being used in form of bleaching powder, made by combining lime and chlorine.

Chloroform, a volatile colourless liquid, compounded of carbon, hydrogen, and chlorine. It is a powerful solvent, not naturally occurring but synthesised on a large scale. When the vapour is inhaled it produces unconsciousness and insensibility to pain. It owes its discovery to Liebig, and its first application for medical purposes to Sir James Young Simpson.

Chlorophyll, the green pigment contained in the leaves of plants, discovered by P. J. Pelletier (1788–1829) and J. B. Caventou (1795– 1877) in 1818. Enables the plant to absorb sunlight and so to build up sugar. *See* **Photosynthesis, Section T**.

Chocolate. *See* **Cacao.**

Chough, a member of the crow family, of glossy blue-green-black plumage, whose long curved bill and legs are coral red. It used to be abundant on the cliffs of Cornwall, but its haunts are now restricted to the rocky outcrops of the western coasts and in the mountains near by. It nests in cleft rocks and caves. The Alpine chough with yellow bill inhabits the mountainous districts of Europe and Asia. The chough is the emblem of Cornwall and appears on its coat of arms.

Christmas means "mass of Christ" from the old English *Cristes maesse*, and is celebrated by the Western church on 25 December. The date of 25 December as the day of Nativity was not generally observed until the 5th cent. A.D., though, as the winter solstice, it had long been observed as a pagan festival of *sol invictus* (unconquered sun).

The first Christmas card dates from about 1843 and the Christmas tree, of pagan origin, was introduced into England from Germany. Santa Claus is a corruption of Santa Nikolaus (St. Nicholas) patron saint of children, whose feast day is on 6 December.

Chromium, a very hard, bluish-white metal element, no. 24, symbol Cr, melting at very high temperature (above 1,900°C). Its chief ore is chromite or chrome iron-ore (ferrous chromite). "Ferro-chrome" is produced by heating chromite and anthracite in an electric furnace, and chrome steels are prepared by adding the pre-calculated amount of ferro-chrome to melted steel. Best known chrome steel is stainless steel first made by Brearley in 1912 and then developed enormously at Sheffield. A typical formula is 18 per cent. chromium, 8 per cent. nickel, 74 per cent. iron.

Equally important are Stellite alloys, containing chromium, cobalt, tungsten (or molybdenum), which have made possible modern high-speed cutting tools. Dies used in manufacture of plastics are commonly of chrome steel. The elementary metal finds little use alone except in chromium-plating for motor cars, *etc.*

Chromosomes, the structures contained within the nucleus of every animal and plant cell by which genetic information is transmitted. The chromosome number in somatic (body) cells is constant for each species of plant and animal, *e.g.*, man (46), cat (38), mouse (40) honey bee (16), fruit fly *Drosophila* (8), potato (48).

Chromosomes are long molecules composed of deoxyribonucleoproteins (*i.e.*, proteins and DNA). Human chromosomes have been the subject of much recent research since it has been found that certain disorders are associated with chromosomal aberration, *e.g.*, in Down's Syndrome an extra chromosome is present. In 1997 US scientists created the first artificial human chromosomes *See also* **Section T.**

Chub. *See* **Carp.**

Church Commissioners. The Church Commissioners were established in 1948 by the amalgamation of Queen Anne's Bounty (established 1704) and the Ecclesiastical Commissioners (established 1836) to administer Church revenues and to manage Church property.

Cid, El, a famous Spanish hero of the 11th cent., Don Rodrigo Diaz de Vivar, also called Cid Campeador, whose exploits, against Christians and Moors alike, are widely celebrated.

Cilia, minute hair-like projections on the surface of some cells, which beat together in wavelike movements like the wind over a corn-field.

These movements can be used as a means of locomotion as in the aquatic organism paramecium. Cilia are also found on the outer layers of the human trachea where they waft particles upwards to the throat, thus protecting the lungs. *See also* **Flagella.**

Cinque Ports, a number of seaport towns on the coast of Kent and Sussex, originally five; Hastings, New Romney, Hythe, Dover and Sandwich. Winchelsea and Rye were added later.

These ports were required to furnish a certain number of ships, ready for service, and in return they were granted many privileges. The official residence of the Lord Warden is Walmer Castle, near Dover. The first woman to hold the office was the Queen Mother (from 1979 to 2002).

Cistercians, an order of monks and nuns taking their names from Citeaux, near Dijon, where their first monastery was established in 1098. The order was noted for the severity of its rule. They were famous agriculturists. The habit is white, with a black cowl or hood.

Civets, creatures with cat-like bodies, but not cats at all. They are related to the mongoose.

Civil List is the estimate of the expenses incurred by the Sovereign in conducting her official business and engagements and those of the members of her family during each year. The amount is granted by Parliament upon the recommendation of a Select Committee and has to be settled afresh in the first six months of a new reign. The Civil List of Queen Victoria was £385,000; Edward VII and George V, £470,000; Edward VIII and George VI, £410,000; Elizabeth II £475,000. In 1990, a fixed 10-year Civil List arrangement was agreed for all the Royal Family. This was changed in 1992. Now only the Queen and Prince Philip receive Civil List (Sovereign Grant) payments.

The Prince of Wales does not receive a Civil List payment but derives his revenue from the Duchy of Cornwall. Other resources available to the Queen include (1) the sums which Parliament votes to government departments each year, *e.g.*, upkeep of palaces (Department of the Environment); (2) privy purse (revenues of the Duchy of Lancaster); (3) personal fortune, the size of which is not disclosed. In 1992 the Queen agreed to pay tax on her private income and meet the working expenses of junior members of the Royal Family.

The system under which annual payments are made by the Government to the Queen was changed by the Civil List Act 1975; payments are now included in the annual estimates in the same way as the expenditure of a government department. In July 2000 the Civil List was frozen for ten years (until the end of 2010). It was frozen again in 2010. The new Sovereign Support Grant replaced the Civil List in 2013. For 2016–17, it rose to £42·8 million.

Cleopatra's Needle on the Thames Embankment is from the time of Tuthmosis III (1500–1450 B.C.). The monolith had nothing to do with Cleopatra, as it only came to Alexandria after her death. It was first erected at the Biblical On (Greek Heliopolis), sacred City of the Sun. It was presented to the British Government by Mehemet Ali in 1819, but not brought to this country until 1878. Weight *c.* 183 tonnes; height, 20·8 m. Pollution has now changed its former rose-red granite to a grubby grey.

Climate is the total experience of the weather at any place over a specific period of time. Not only averages but extremes of temperature, variation of humidity, duration of sunshine and cloud cover, amount of rainfall and frequency of snow, frost, gales, etc., are amongst the data normally investigated. The interiors of great land masses are characterised by large ranges of temperature and low rainfall (*continental climate*), while proximity to oceans has an ameliorating effect with increase in rainfall (*oceanic climate*).

Presence of mountain ranges and lakes and configuration generally produce local modifications of climate, also apparent between the centre and the outlying suburbs of a city. Latitude introduces zones of climate, *e.g.*, tropical rain, subtropical steppe and desert, temperate rain and polar. *See also* **Section V**.

Clock, a device for measuring the passage of time. The earliest timekeeper was the shadow-clock, a primitive form of sundial, used in Ancient Egypt about 1500 B.C. To find the time at night the water clock or clepsydra was used. The sand-glass dates from the 15th cent.

No one knows when mechanical clocks were first invented, but it is known that a complicated mechanical clock driven by water and controlled by a weighbridge escarpment was built in Peking in 1090. The Dover Clock in the Science Museum is not the earliest surviving clock in England, as was once believed, but early 17th cent. The Salisbury Cathedral clock dates from 1386 and that of Wells Cathedral from 1392. The pendulum clock was invented by the Dutch scientist Christiaan Huygens (1625–95). The first watches were made in Nuremberg shortly after 1500. The marine chronometer is a high-precision timepiece used at sea for giving Greenwich mean time. The quartz-crystal clocks are accurate to one thousandth of a second a day, and the improved atomic clock, developed at the British National Physical Laboratory, which uses the natural vibrations of the caesium atom, is an almost absolute measure of time. Its accuracy of 1 sec. in 300 years has been improved to 1 sec. in 1,000 years.

Cloud Chamber, an apparatus invented by C. T. R. Wilson in which the tracks of atomic particles can be made visible. Just as the vapour trails tell of the track of an invisible aircraft high up in the air, so the vapour trails of an unseeable particle can tell of its behaviour. The rays under investigation pass through a chamber containing a gas, *e.g.*, air thoroughly cleansed of dust, supersaturated with water, or alcohol- vapour. As the particle passes through it forms a track of tiny water droplets which can be photographed. After a long and honourable history this wonderful instrument is now virtually obsolete. A later ingenious device for tracking fast fundamental particles is the Bubble chamber (*q.v.*).

Clouds are formed by the cooling of moist air, the type depending on the way the air cools and the height at which condensation occurs.

There are three main classes: (1) high cloud (about 6,100 m)—cirrus (delicate and fibrous), cirrostratus (thin white veil), and cirrocumulus (delicately rippled) consisting of ice crystals; (2) medium cloud (above 2,100 m)—altostratus (dense, greyish veil) and altocumulus (broken flattened cloudlets)—chiefly water particles, often supercooled; (3) low cloud (from near ground to 2,100 m)—cumulus (fair weather, broken, dome-topped), cumulonimbus (heavy, towering to great heights), stratocumulus (layer of globular masses or rolls), stratus (like fog but off the ground), nimbostratus (low, rainy cloud).

The highest clouds of all, and the rarest, are the noctilucent, seen only on summer nights in high latitudes. They form at about 80 km above the earth and consist of ice-coated dust from meteors. The spread of these noctilucent clouds may be due to global warming.

Clouds were first classified by the Quaker, Luke Howard in 1804. The World Meteorological Organisation is the body in charge of cloud naming.

On Venus, clouds are made of sulphuric acid. Those on Jupiter consist of ammonia.

Clover, plants of the *Trifolium* genus, family *Leguminosae*, with about 250 species. These are "nitrogen fixing" plants and include red clover, white clover, alsike clover and crimson clover. They are of great importance in agriculture because in a good pasture they supply directly or indirectly most of the protein available to the animals. Seed of "wild white" clover has been accepted since about 1939 as the indispensable plant of good United Kingdom grassland, largely through the efforts of pioneers like D. A. Gilchrist (1859 1927).

Clownfish, a tropical fish very popular as a family pet (it was the star of the film *Finding Nemo*). Clownfish lose their hearing if they grow up in water with high acidity. They only migrate long distances as larvae.

Coal. Until recently the most important single fuel has been coal. It is a mineral of organic origin, formed from the remains of vegetation which over millions of years has changed to coal by the effects of heat and pressure from overlying rock or water. All coal contains moisture, inflammable volatiles, mineral impurities (some of which remain as coal ash after the coal is burnt), and fixed carbon (the coke that is left after the volatiles have been driven off). The relative proportions vary—from Anthracite, a hard coal containing the highest proportion of fixed carbon, to Lignite or brown coal which is little more than a hard peat.

In the UK, coal long formed the basis of past industrial prosperity. Peak output occurred in 1913 when 290 million tonnes were mined, one third of which was exported. At the end of the second world war production had fallen to 186 million tonnes and was far below demand.

In 1947 the British coal industry was brought under public ownership and all its assets were vested in the National Coal Board. During the next ten years great efforts were made to increase coal output but, quite suddenly in 1956, demand for coal fell as oil became a popular fuel. The fall in demand was accompanied by increasing productivity, both mines and miners having been cut in their numbers by over half. Then as a result of the high cost of oil in 1973 came expansion of the industry. From 1984 the coal industry faced a bitter strike over plans to make large-scale pit closures. The defeat of the miners weakened the NUM and its leader, Arthur Scargill. The Government decision (in 1992) to close many of the remaining collieries and to privatise the industry created a bitter political controversy. By early 1995 the last pits had been privatised and the workforce decimated. The closure of Kellingley colliery in Yorkshire in 2015 ended underground mining in Britain. But around 40% of Britain's electricity is still provided by coal from abroad. These coal-fired power stations will be phased out by 2023. Today there is a huge demand for coal from India (which has huge reserves) and China.

Coat of Arms, in heraldry, a device containing a family's armorial bearings. In medieval times the coat upon which such device was embroidered; knights wore it over their armour.

Coati, a fox-sized creature belonging to the racoon family. Usually found in South America.

Cobalt, element no. 27, symbol Co, a white metal melting at 1490°C. Two main ores are *cobalt glance* (in which the element is combined with arsenic and sulphur) and *smaltite* (cobalt arsenide). The principal sources are Ontario and Congo. Various cobalt alloys are important, *e.g.*, stellite, ferrocobalt and carboloy. Its monoxide is an important colouring medium, and is used for colouring glass and porcelain blue and in mobile-phone batteries. Discovered by the Swedist chemist Georg Brandt.

Cobra, hooded and very venomous snakes. The best known species are the Indian Cobra, the Egyptian Cobra, and the Black-necked Cobra. Their food consists chiefly of small rodents, The King Cobra is almost exclusively a snake-eater. The "Spitting" Cobras (or Ringhals) of S. Africa are a related genus, capable of spitting their venom several yards. The King Cobra possesses enough venom to kill 100 people.

Coca, a S. American shrub, *Erythroxylon coca*, also cultivated in Java. The leaves yield cocaine, classified as a dangerous drug. When the local people chew the leaves they are enabled to withstand hunger and fatigue, as cocaine acts both as a mental stimulant and as an anaesthetic on the mucous lining of the stomach. Colombia is a centre of the trade (along with Peru and Bolivia).

Cochineal *or* **Carmine,** a dyestuff consisting of the dried bodies of the female scale insect (*Dactylopius coccus*) which feeds on cacti. Of ancient origin, the dye was well known to the Aztecs, and was used widely in the Middle Ages. The scarlet tunics worn by the English during the Napoleonic wars owed their colour to carmine.

Cockatoo, a member of the parrot family, bearing a crest of feathers on the head, native to Australia and adjacent regions. Predominant colour is white tinged with yellow or scarlet while some species have dark plumage. The cockatoo of New Guinea is slaty black with pale red cheeks and can crack Kanary nuts. Its survival is threatened by the pet trade.

Cockchafer (*Melolontha*), one of the most destructive of beetles, the larvae feeding on roots. It is about 2·5 cm in length, of a brownish colour, and emits a loud whirring sound when flying.

Cockle, the popular name of the bi-valve shell-fish of the genus *Cardium*, found in sandy bays.

Cockroach, inaccurately called the "black beetle"; a pest of bakeries and kitchens. In Britain two species are commonly found; the Common Cockroach (*Blatta orientalis*), about 2·5 cm long, with the wing covers long in the male and short in the female; and the German Cockroach (*Blatta germanica*), now the most common, half the size, dark yellow, with both sexes fully winged. All species have long antennae and flattened, leathery, shiny bodies. They are nocturnal and omnivorous. Cockroaches are the nimblest creatures on Earth and survived the extinction of the dinosaurs. They have extremely powerful jaws. There are 4,600 named species.

Cocoa. *See* **Cacao**.

Coconut Palm (*Cocos nucifera*), a tropical tree, growing to a height of 30 m, with a slender trunk surmounted by giant feather-like leaves. One of the most important sources of food and raw material for people living in the tropics. The juice of the fruit, or coconut, is drunk; the kernel is eaten fresh or dried to form copra, which yields animal feeding stuffs and oil, used in the manufacture of soap, margarine, cosmetics, *etc.*; leaves are used for thatching; leaf stalks for canes, fence posts, *etc.*, and the trunk for houses and bridges.

The main producing areas are: Indonesia, Philippines, Malaysia, Sri Lanka, south India and the Caribbean, but demand outstrips supply.

Codes, a term used to designate a system of laws properly classified. The Code of Hammurabi, king of Babylon, *c.* 1751 B.C., had extensive influence over a long period. The Romans formulated several codes of historic importance including the Theodosian Code which summarised the Roman laws from the time of Constantine to 438 A.D. The final codification was made under order of the Emperor Justinian by his chief minister Tribonian and published in 529 with a new edition in 534. The most important of modern codes is the *Code Napoléon*, compiled between 1803 and 1810, and still in force. It has been used as an example for the codification of the laws of a number of countries from America to Japan. Under Frederick the Great the law of Prussia was codified.

English law has never been codified, although the law on some subjects has been gathered up into a single statute. The Law Commission Act, 1965, sought to consolidate and codify the law.

Codex, a collection of written pages, stitched and bound together. The oldest extant Greek codex is the Sinaiaticus of the 4th cent. (*see below*). The Vatican codex (4th cent.) and the Alexandrine codex (5th cent.) are other examples. *See* **Papyri.**

Codex Sinaiaticus. The British Museum, in 1933, purchased the *Codex Sinaiticus* from the Soviet Government for £100,000. The Sinaiaticus was written on 347 vellum leaves some fifteen to sixteen hundred years ago and the binding into 2 volumes was completed by Douglas Cockerill and his son in 1936. It was sold in 1981 for $5·2 million. It is one of the world's most important Christian manuscripts. Written in Greek at the time of Constantine, it once contained the whole Old and New Testaments and the Aprocrypha, but the Old Testament has been lost.

Coelacanth, a primitive fish living off the Comoros Islands (and also off Indonesia). The coelacanth represents the period in history when fish began slowly to evolve into four-legged animals. Its survival is now threatened by fishing fleets.

Coffee, a shrub found originally in Arabia and Ethiopia, but now extensively grown in Brazil, Colombia, Ivory Coast, Uganda, Angola and Central America. It yields a seed or berry which after undergoing the necessary preparation, is ground and used in most countries as a breakfast beverage. The best coffee is the Mocha, an Arabian variety. The stimulating effect of coffee is due to the caffeine, which is also present in tea. The beverage was introduced into Europe in the 17th cent., and the first London coffee shop was opened in 1652. It has become the daytime drink of our age. The largest coffee producers are Brazil, followed by Vietnam and Indonesia. Coffee could become a high-profile victim of climate change unless new types of bean can be produced. *See also* **R17**.

Coinage. *See* **Currency**.

Coke is the solid residue remaining when coal is carbonised and nearly all the volatile constituents have been driven off. Used as fuel, and as an agent for reducing metallic oxides to metals.

Coleoptera. *See* **Beetles**.

College of Arms. *See* **Heralds, College of**.

Colorado Beetle, a serious pest of potato crops. Both adults and larvae feed on the foliage where the orange eggs are laid. The grub is reddish, with two rows of small black spots on each side. The adults are about 1·2 cm long with yellow and black striped wing cases. The beetle is avoided by birds because of its nasty taste, and is controlled by arsenical sprays.

Colosseum, the name of the Flavian amphitheatre at Rome, begun by Vespasian and finished by Titus A.D. 80. In general outline it still remains one of the most magnificent ruins in the world. In the arena the famous gladiatorial displays and mimic naval battles used to be given, and about 50,000 spectators could be accommodated.

Colossus is the name which the ancients gave to any statue of gigantic size. The Colossus at Rhodes, which was a bronze statue of the sun god, Helios, was the most famous, and reckoned among the seven wonders of the world. It stood over 30 m high at the mouth of the harbour. It fell in an earthquake in 224 B.C.

Colugo, also known as "flying lemur", caguan or kubuk, a remarkable mammal which may be regarded as an aberrant insectivore or an aberrant form of the earliest ancestor of the bats. It has nothing to do with lemurs. There are two genera, one inhabiting the Philippines and one inhabiting Malaysia. They have a parachute-like membrane which covers them from the neck to the tip of the tail, by means of which they can glide from treetop to ground.

Comets are celestial bodies which generally move about the solar system in elongated elliptical or nearly parabolic orbits. Most comets are in the latter category, having extremely long orbital periods, up to millions of years, and have therefore only been seen once in recorded history. They spend most of their lifetimes at extremely large distances from the sun, far outside Pluto's orbit. Those in elliptical orbits appear periodically and a few have been observed regularly.

Halley's comet, named after Edmund Halley, who first correctly predicted that this comet would reappear in 1758, was first observed in Roman times and is one of the brightest of the periodic comets. The nucleus of a comet, which appears as a faint star when the comet is very far from the sun, is no longer believed to be a frozen mixture of dust and materials called "ices".

The core is now thought to be composed of hard material, not dust. Approaching the sun, the comet is heated by sunlight and the surface material is first vaporised and later photo-dissociated and ionised by sunlight. The gases and ions produce the fuzzy look of the coma of the comet.

Under the influence of sunlight acting on dust, and the solar wind and interplanetary field acting on the ions, the cometary tail (often multiple) is produced. This may stretch up to 200 million km, pointing away from the sun.

Donati's comet (1858) was possibly the most spectacular of all and was visible even in daylight. Kohoutek's comet (1975) was the first to be observed from space by the American Skylab and Russian Soyuz. Images from the Hubble telescope suggest there are many millions (if not billions) of comets orbiting the Sun in a belt that lies beyond the orbit of Neptune and engulfs that of Pluto. (*see* **Oort Cloud**).

A spectacular comet appearance in 1997 was Hale-Bopp (which was last visible from Earth *c.* 2600 B.C. The Rosetta space mission (from 2004 to 2016) landed a robot on the comet 67P in November 2014. Although it landed awkwardly and soon lost power, it nonetheless revealed that comets contain organic materials. They suggest that comets could be the messengers of life.

The Stardust space probe, launched in 1999, has collected grains of stardust dating from before the Sun was born. The probe has also gathered glycine, an amino acid (a vital building block of life) from a comet tail. In 2005 the Deep Impact probe collided with Tempel 1 to collect data.

The longest comet tail ever recorded (350 million miles) was observed in 2000 (a trail left by the comet Hyakutake).

Commons are the remnants of the medieval open fields round villages in which the villagers had rights in common, *e.g.*, (i) **estover**—the right of taking wood for house building or firewood; (ii) **pasture**—the right of grazing beasts; (iii) **turbary**—the right of digging turf; (iv) **piscary**—the right to fish. Many of these common lands were enclosed during the agrarian revolution which went on steadily in England from the 15th cent. onwards, and with their enclosure common rights vanished. A Royal Commission on Common Land described the commons in 1965 as the "last reservoir of uncommitted land" which provide, as far as the public is concerned, by far the largest part of the accessible open spaces of the country.

Under the Commons Registration Act, 1965, it was the duty of the relevant local council to make a register of all common land and all town and village greens in their areas.

Today there are around 1·3 million acres of common land in England and Wales, held by a variety of bodies. There are *c.* 10,000 village greens, some under threat from developers.

Compass *or* **Mariner's Compass.** It has been known since very early times that an iron needle, suspended freely to hang horizontally when not magnetised, comes to rest roughly along the geographical north–south line when magnetised. Further, it generally does not hang horizontally. This is the essential behaviour of the *compass*, a navigational instrument whose invention is obscure but which seems to have been known to the Chinese 4,500 years ago. That the behaviour of the compass shows the existence of a *magnetic field* associated with the Earth was first fully recognised by William Gilbert in 1600. Aircraft and ships now largely employ gyrostatic compasses which are not affected by electrical and magnetic disturbances. Sperry, Brown and Anschutz are three important types of gyroscopic compass.

Composite Materials, or more simply composites, are materials which derive useful properties by combining the virtues of two or more components. Combining clay with straw to make tougher bricks is an ancient example in which fibres (straw) are embedded in a matrix or body (the clay). A modern example is fibreglass in which glass fibres are embedded in a plastic matrix. Nature also uses composites as in bamboo in which a lignin matrix binds together the fibres of cellulose to make a light strong structure. Composites may contain flakes or particles embedded in the matrix instead of fibres—it depends on the application. Although the idea is not new composite technology has made rapid strides in the last few decades guided by scientific insight into the nature of solids and the origin of their stengths and weaknesses.

The motivation had been that scientifically designed composites offer materials with exceptional strength/weight ratio, desirable magnetic properties and other technological advantages which meet the extreme demands of a variety of industries. For example, composite aluminium containing boron fibres or resin containing graphite fibres can have strength/ weight ratios over twice that of highstrength solid aluminium.

Conclave, an assembly of Roman Catholic car-dinals met together to elect a pope. The last Conclave was held in the Vatican in March 2013 when the 115 cardinal-electors chose Cardinal Jorge Mario Bergoglio of Argentina as the successor to Benedict XVI. A Jesuit, he was also the first Pope from the Americas. He took the name Francis I.

Concorde, supersonic airliner whose first flight was from Toulouse on 2 March 1969 and the first British flight from Felton in Bristol on 9 April 1969. More than 2½ million passengers travelled on Concorde between 1976 and its withdrawal from service in 2004. The plane could cruise at 1,350 mph at altitudes up to 60,000 ft. In February 1996 it flew from New York to London in 2 hrs 52 mins.

Condor, a large eagle of brilliant black plumage with a circlet of white feathers round its neck. It is a native of the Andes. There are two types of New World condor, the Andean and the Californian. Both are black, but the Andean condor has a pink head, the Californian a yellow head and red neck. They are among the rarest of birds. The condor acts as the vulture of the Andes.

Coniferae are cone-bearing trees, including firs, pines, cedars, cypresses, junipers, yews, *etc.*, and are widely distributed in temperate regions. Urgent conservation measures are needed to protect some of these trees.

Constellation, a grouping of stars that forms a pattern when seen from Earth. There are a total of 88 constellations in use on modern star charts, some of which are much larger than others. The stars within a particular constellation are not necessarily close to each other in space. In most cases they only appear close together due to their lying in more or less the same line of sight as seen from Earth.

Constitution, the fundamental organic law or principles of government of a nation, state, society, or other organisation, embodied in written documents, or implied in the institutions and customs of the country or society.

Continent, a word used in physical geography to denote the larger continuous land masses in contrast to the great oceans of the earth. They are: Eurasia (conventionally regarded as 2 continents, Europe and Asia), Africa, North America, South America, Australia and Antarctica. (Australasia is Australia, New Zealand and adjacent islands. Oceania is Australasia and the many islands of the S.W. Pacific.)

Continental Drift. The hypothesis of drifting continents is due to F. B. Taylor, an American geologist who published his theory in 1908, and to the Austrian meteorologist Alfred Wegener. The latter was impressed by the matching coasts of South America and Africa, which seemed to him to fit together like the pieces of a jigsaw puzzle. Since then other people have taken up and developed the idea. *See* **Plate Tectonics, Section V**.

Conurbation, a term used in reference to an extensive and continuous area of urban land-use. Conurbations are frequently formed by the physical coalescence of several formerly free-standing towns. They may themselves coalesce to form an even higher order (a megalopolis).

Convocation, an assembly called together to deliberate ecclesiastical affairs. In the Church of England the provinces of Canterbury and York each have their convocation. The term is also applied to certain academic gatherings.

Coot. A very widely distributed bird of the rail family and a common resident of the British Isles. The adult is black with a conspicuous white bald shield on the forehead and a white bill. The juvenile is brownish grey with whitish breast and throat. The coot flies heavily, but swims well. It dives frequently and can remain submerged for a considerable time. It is pugnacious and in winter gregarious. The food is chiefly vegetable. The large nest is usually built among aquatic vegetation and the young are fed by both parents. The Crested Coot, occurs in S. Europe.

Copernicium. Element No.112, 277 times heavier than hydrogen and produced by nuclear fusion.

Copper, one of the most familiar of metals, element no. 29, symbol Cu, used in ancient times as an alloy with tin in producing bronze, and preceding iron as an industrial material. Copper ores are most abundant in the USA, Chile, Canada, Zambia and Congo. All copper compounds are poisonous. Called the "red metal".

Copyright. Under the old Copyright Act, 1956, copyright subsists in every original literary, dramatic musical, and artistic work if the author is a British subject or a citizen of the Republic of Ireland or resident in the United Kingdom, or if the work is first published in the UK.

The Act provided that, except in certain special cases, the author of the work shall be the first owner of the copyright, and there are no formalities, such as registration or payment of fees, to be accomplished. Copyright includes the right to reproduce the work in any material form, to perform the work in public, or, if the work is unpublished, to publish the work.

The Act also protected sound recordings, films and television and sound broadcasts. Literary, dramatic, musical and artistic works which enjoy the protection of the Act are automatically protected in those countries which are parties to the Berne Copyright Convention or the Universal Copyright Convention.

In general, copyright in literary, dramatic, musical and artistic works is vested in the author for the period of his or her lifetime and 50 years following after which it passes into the public domain and becomes freely available to any who wish to make use of it. The EU has proposed extending copyright protection to 95 years.

The Copyright Libraries, entitled to receive copies of books published in the United Kingdom are given under **Libraries.** The Berne Copyright Convention and the Universal Copyright Convention were revised at a diplomatic conference held in Paris in 1971. The effect of the revisions allows any national of a developing country to obtain, under certain conditions, a compulsory licence to translate and publish a copyright work for the purpose of teaching, scholarship and research, upon payment of compensation to the copyright owner of the original work.

The Copyright Designs and Patents Act, 1988, updated the old law on copyright (and has itself been amended in the light of recent EU regulations). The first new unified EU patents were issued in 2014. In the USA, the 1998 Digital Millennium Copyright Act was enacted to combat Internet piracy (but was soon obsolete).

Coral, an order of small marine animals closely related to the sea-anemone, but differing from it in their ability to develop a limy skeleton. They multiply sexually and by budding. The structure of the coral secretions assumes a variety of forms, fan-like, tree-like, mushroom shape, and so forth. Red coral (the skeleton of *Corallium rubrum*) is mainly obtained from the Mediterranean.

The coral reefs of the Pacific and Indian Oceans are often many miles in extent. The largest is the Great Barrier Reef, which is 1,400 miles long and 150 miles across at its widest. Living corals occur only in warm seas at about 23°C. Scientists have predicted that most coral reefs will have been destroyed within 30 years by rising sea temperatures caused by global warming. They are also threatened by deep-sea trawling.

Corals adapt their shape and form according to the ratio of magnesium to calcium in the water. They are the rainforests of the seas and maybe the medicine cabinets of the future.

Cordite, a smokeless explosive adopted for small arms and heavy artillery by the UK in the naval and military services in 1889, and composed of 58 parts of nitro-glycerine, 37 of gun-cotton, and 5 of vaseline. It is a jelly or plastic dough, and used in the form of sticks. Invented by Sir Frederick Abel and Sir James Dewar in 1889.

Cork, the bark of a species of oak, *Quercus suber*, grown largely in the South of Europe and North America. The cork tree is said to yield bark every six to ten years for 150 years, and grows to a height of from 6–12 m. Its lightness, impermeability, and elasticity enable it to be used for a variety of commercial purposes, especially for stoppers of bottles.

Cormorant, a large, long-billed water-bird which captures fish by diving. The common cormorant has bronze-black plumage with white cheeks and sides and is found round the sea coasts of most parts of the world, including the British Isles. It nests in colonies on sea cliffs and rocky ledges. The Shag or Green Cormorant is a smaller bird with green-black plumage and a crest.

Corncrake. Once a regular summer visitor to Britain. The harsh and piercing note of this bird was a familiar sound in cornfields. After nearly becoming extinct, its numbers are reviving.

Cornish. *See* **Kernewek.**

Corona or **Solar Corona**, the outer atmosphere of the sun. This glows by virtue of light emitted by the sun and scattered by electrons and dust particles at various heights in the sun's atmosphere and also by light emitted from ionised atoms in the corona itself. Corona light is much fainter than the bright disc of the sun and is invisible against the normal blue of the sky. During total solar eclipses, the corona can be seen by the human eye as a faint glow extending irregularly outwards a few solar diameters from the sun. The sun's atmosphere extends much further than this but is invisible to the eye at large distances from the sun.

The corona gases are thought to be very hot (millions of degrees) and in complex violent motion; the gross structure of the corona is connected with the sunspot cycle.

Corporal Punishment in Britain has seen much recent legislation. Caning in state schools was made illegal in 1986 (in public schools in 1999). Birching as a judicial punishment was abolished in 1948. Flogging was stopped in the Royal Navy in 1957 and in prisons and borstals in 1967. The 'reasonable chastisement' of children allowed under the 1933 Children and Young Persons Act has been challenged (*e.g.* in 1998 in the European Court).

An attempt to ban any form of smacking was defeated in November 2004. The first country to ban smacking was Sweden in 1979.

Cortes, the Parliaments of Spain and Portugal.

Cosmic Rays are a form of radiation coming from outer space, of deep penetrating power and of great scientific interest. The rays consist of extremely energetic atomic particles—protons, electrons and some heavier nucleons—travelling at speeds very close to that of light. A complex series of events result from their collision with the atmosphere, giving rise to showers of secondary high-energy particles.

Low energy cosmic rays can be studied from space satellites and space probes. Intermediate energy cosmic rays are investigated using sensitive detector arrays on mountain tops or space-satellites. High-energy cosmic rays can only be studied indirectly at ground level. The great interest is because we now believe their origin to be in, or associated with, some of the most interesting objects in the universe—supernovae, neutron stars, pulsars and perhaps some gigantic galactic nuclei. *See* **Section T, Part I.**

Cosmology. *See* **Section T.**

Cotton, the name of a plant of several species bearing large yellow flowers with purple centres. These centres expand into pods, which at maturity burst and yield the white fibrous substances known as cotton. The raw cotton contains a large proportion of seeds which are removed by "ginning". Long before the Christian era, cotton had been grown and used with great skill in India to make fabrics. The industry was not introduced into England until the middle of the 17th cent. when Protestant refugees from Flanders came to settle in the wool textile districts of East Anglia and Lancashire. With improvements in machinery and expansion of overseas trade in the 18th and 19th cent., Lancashire became the centre of the world's cotton industry but now man-made fibres have taken the place of cotton. The largest cotton producers in the world are China, the United States and Uzbekistan.

Cotton Gin, invented in 1793 by the American Eli Whitney. By automating the production of cotton fibre from seed pods, it revolutionised cotton-growing.

Coulomb, a unit of electric charge, named after the French naval engineer, Charles Augustin de Coulomb (1736-1806), equal to the quantity of electricity transferred in one second by a current of one ampere.

Council of Trent. *See* **Trent, Council of.**

County. After the 1972 reorganisation of local government in the UK the distinction between *administrative* counties and *geographical* counties no longer existed. Certain geographical counties disappeared (*e.g.*, Pembroke), new counties appeared (*e.g.*, Gwynedd), *See also* **Section D**.

Court Leet, a court of record held annually before the steward of any particular manor or lordship; originally there was only one court for a manor, but in the time of Edward I it branched into two, the court baton and the court leet.

Courts. *See* **Magistrates**.

Coyote, an animal belonging to the dog family. Native to North and Central America, it displays an exceptional capacity for survival. Coywolves have resulted from interbreeding with wolves.

Coypu or **Nutria Rat,** a large beaver-like rodent found naturally in S. America.

Crane, a large, graceful wading-bird with elegant long legs and neck, greyish plumage, superficially resembling the heron and related to the bustard. They migrate in V or W formation and have trumpet-like voices. There are fourteen species, found in all continents except S. America, including the Crowned Crane with golden coronet and the Demoiselle with tuft-like crest of white feathers. The Common Crane nested in East Anglia in medieval times. They mate with their partners for life.

Creed (Latin *credo* = I believe), is a formal statement of belief. The three orthodox Christian creeds are the **Apostles' Creed** (a summary of their teaching), the **Nicene Creed** (drawn up by the Church Council at Nicaea in A.D. 325 to define its theological doctrines), and the **Athanasian Creed** (on the nature and divinity of Christ).

Cremation, ancient custom, revived in Victorian times, of burning the dead. Cremation was first legalised in Great Britain in 1884 and the first crematorium opened at Woking in that year. Earlier Sir Henry Thompson had founded the Cremation Society of England in 1874.

Application for cremation must be accompanied by two medical certificates. Orthodox Jews and Muslims forbid cremation. Nowadays, most Britons choose cremation.

Creutzfeldt-Jakob Disease, *See* **Mad Cow Disease**.

Cricket, a genus of insects of the grasshopper order which move by leaps. The male produces a chirping noise by rubbing its wing-covers together. Just as the males inherit the nerve machinery for emitting the song of the species, so the females receive and respond to that song and to no other. Our warming climate means the chirping of crickets is now more common.

Crinoids. *See* **Sea Lily**.

Crocodiles and their allies (alligators, caymans and gavials) are the largest of modern reptiles. They are well equipped for a predatory life in shallow waters, having powerful tails and strong jaws. Their eggs are laid on land, in sand or decomposing vegetation. Their wounds never become infected because of a bacteria-destroying protein in their blood. There are 23 species and they are capable of complex navigation over long distances. The Gharial crocodile of India and Nepal is rapidly declining. However, in Australia salt water crocodiles are increasing. Crocodiles are responsible for the deaths of around 2,000 people each year.

Crow, a family of birds including many well-known species such as the rook, raven, jackdaw, carrion crow, hooded crow, magpie, nutcrackers, jaw and chough. They are intelligent birds.

Crufts, the most famous dog show, first held in Islington in 1891 with 2,437 entries and 36 breeds.

Crux. *See under* **Southern Cross.**

Cryogenics (Greek roots: productive of cold) is the science dealing with the production of very low temperatures and the study of their physical and technological consequences. "Very low" is often taken to mean below about −150°C.

The growth of cryogenics (essentially a 20th-cent. science) is connected with the discovery of how to liquefy all gases including even helium which resisted liquefaction until 1908. Scientifically, cryogenics is important partly because special phenomena (*e.g.*, superconductivity (*q.v.*)) appear at lower temperatures and partly because more can be learned about ordinary properties by studying them in the absence of heat.

Technologically, cryogenics is becoming more and more significant, for example, liquefied gases are rocket propellants, superconductors make valuable magnets, tissue-freezing techniques (using very cold liquids) have been introduced into surgery. The low-density ice, known as *glassy water*, may be able to be used to "freeze" human bodies successfully. *See* **Absolute Temperature.**

Crystal, in everyday usage, a solid chemical substance bounded by plane surfaces which show a regular geometrical arrangement as, *e.g.*, quartz crystals, rock salt, snow flakes. In physics the term means any substances whose atoms are arranged in a regular three-dimensional array. This includes most solids, even those not particularly crystalline in appearance, *e.g.*, a lump of lead. *See* **Glass** and **Liquid Crystals.**

Cuckoo, a well-known migratory bird which is found in Great Britain from April to July, hawk-like in shape, with a very characteristic note, uttered during the mating season only by the male. The hen has a soft bubbling call. It lays its eggs in the nests of other birds, *e.g.*, the meadow pipit and hedge sparrow, but only one egg in each nest. Feeds mainly on insects, particularly hairy caterpillars. For many years, its numbers have been in serious decline, partly because it still arrives in Britain at its traditional time when insect levels have now peaked. It migrates 4,000 miles to West Africa.

Cucurbitaceae. *See* **Gourd Family.**

Cuneiform, (Latin = *wedge-shaped*), an ancient method of writing by impressing wedge-like strokes into tablets of damp clay which when dried and hardened formed a permanent script, Cuneiform writing developed from its original pictographic form into a phonetic writing and can be traced back to the non-Semitic Sumerians of ancient Mesopotamia, the earliest civilisation known to us. It passed to the Semitic Accadians of Babylonia in the 3rd millennium B.C. who adapted it to their own language. Decipherment by Sir Henry Rawlinson, 1835. One of the first written scripts in history.

Curfew (Old F. *covre-feu* = cover fire), a regulation common throughout Europe in medieval times by which, at a fixed hour in the evening, the church bell was rung as a signal that fires were to be put out and the people were to go to bed. The custom originated in the fear of fire when buildings were built of timber.

Curia, the central government of the Roman Catholic Church. Its twelve Sacred Congregations or "ministries" were reduced to nine from 1968.

Curie, a measure of the rate at which radio-active material emits radiation. One curie is a disintegration rate of $3{\cdot}7 \times 10^{10}$ disintegrations per second.

Curlew, a wading-bird of which there are several species. It frequents marshy places, feeds on worms, insects, molluscs and berries and has a long, down-curved bill. Now in serious decline. It has an evocative call.

Currency is the name given to the types of cash money—metal or paper—in use in an area (*e.g.* pound, sterling, dollar, Euro). It also designates the actual coins or notes issued. Its amount is usually subject to regulation by the Government, or by a Central Bank acting on the Government's behalf. Britain changed over to a £-based decimal currency in February 1971.

On 1 January 1985, ½p coins ceased to be legal tender. The old "halfpenny" first appeared in 1280. The Royal Mint produced a smaller and lighter 50p coin. The old 50p ceased to be legal tender on 28 February 1998. The first two-colour coin (the £2 coin) entered circulation in June 1998. A new design £20 banknote became legal tender in June 1999. It featured new devices to protect against counterfeiting. The most recent £20 note bears the image of Adam Smith, the first Scot on an English banknote. From 2016 plastic £5 bank notes were in wide circulation (they began circulating at Scotland's Clydesdale Bank in 2015). A £10 note followed in 2017 and a £20 note by 2020. A 12-sided £1 coin was introduced in March 2017.

There are plans for Wales to have its own bank notes for the first time.

The first pound coin was minted in 1489 by Henry VII. It was made of gold and became known as the sovereign.

Cybernetics, the science concerned with the automatic control and communication processes in both animals and machines. Thus it is concerned with brain function, information theory, electronic computers, and automation.

Cyclamen. The national flower of Cyprus.

Cyclone, a term usually applied to a tropical revolving storm. Cyclones often occur towards the end of the hot seasons and are mainly confined to tracks in the western areas of the oceans, being known as hurricanes (Caribbean and Pacific), cyclones (Indian Ocean) and typhoons (China Seas). The circulation of air in a cyclone is similar to that in the *depression* of temperate latitudes, but the region of low pressure is much more localised and the pressure gradients steeper. Winds of hurricane strength and torrential rain occur generally, although at the centre of the storm there is a small area, known as the "eye", where fair, calm weather prevails. Hurricane Andrew, which hit Florida in August 1992, left 250,000 people homeless. Hurricane Katrina devastated the New Orleans area in August 2005 leaving an untold number of dead. The USA was hit again in 2012 when Hurricane Sandy left a trail of devastation centred on New York and New Jersey.

Half the cyclones in the world are formed in the Pacific Ocean.

Cyclotron, a machine for accelerating charged particles such as protons to very high energies. Devised by E. O. Lawrence in California in 1930, it uses a magnetic field to make the particles traverse nearly circular paths and an electric field to give them an additional pulse of energy each time round. The accelerated particles impinge on targets, and the resulting events are a basic source of information for nuclear physicists. The cyclotron is obsolescent and has led to the development of other machines, *e.g.*, betatrons, synchrotrons. Britain has two major national high-energy machines: a 7 GeV proton synchroton (to be closed and replaced by a "spallation neutron source"), and a 5 GeV electron synchrotron.

D

Dab, a flatfish species of fish found in the North Sea. A relatively unloved species.

Dactylopterus, a fish of the gurnard family, with wing-like pectoral fins; sometimes known as the flying fish, though that appellation is more generally given to *Exocaetus exiliens.*

Daddy Longlegs, or **Crane-fly,** a slender long-legged fly of the family Tipulidae. The larvae which do damage to lawns and plants are called leather-jackets. The Americans call Harvestmen (*q.v.*) daddy longlegs.

Daguerreotype, the first practical photographic process, invented in Paris by M. Daguerre during the years 1824–39. The light-sensitive plate was prepared by bringing iodine in contact with a plate of silver. After exposure a positive image came by development of the plate in mercury vapour. Even for openair scenes the first daguerreotypes involved exposure of 5–10 minutes. The picture came in one copy and the process was therefore of limited use. The wet collodion process (1851) rendered the technique obsolete.

Dail Eireann, the name of the national parliament of the Irish Republic.

Dalai Lama, the temporal and religious leader of Tibet. The present Dalai Lama, Tenzin Gyabo (b. 1935), the 14th reincarnation, fled to India in 1959. Awarded the 1989 Nobel Peace Prize. He may well be the last Dalai Lama.

Lamas (meaning 'superior ones') are Tibetan Buddhist monks. The Panchen Lama is held to be the reincarnation of the Buddha of Light. *See* **Lamaism, J29.**

Dances come in a whole variety of types. The waltz originated in the 18th century, but achieved pre-eminence in the 19th century. The music of Johann Strauss the Younger earned him the title of 'Waltz King'. *See* **Special Topic, end Section P.**

Dark Matter. It is thought that dark matter (so-called because it is invisible) makes up about 82% of space in the universe. We know it exists from its gravitational effect which can bend light. It is dark matter that holds the galaxy together. It appears to be composed of sub-atomic particles that do not interact at all with the visible matter of stars and planets. Dark energy is the mysterious force causing the universe to expand.

Darter 1. Snakebirds are a genus of the pelican family, with long, pointed bill and serpent-like neck and resembling cormorants in appearance. There are 5 species. 2. Numerous species of small freshwater fish belonging to the perch family, found in N. America.

Date Palm. *Phoenix dactylifera*, one of the oldest known food plants widely cultivated in N. Africa and W. Asia. It grows to 30 m and continues to bear for 2 or 3 centuries, its fruit being of great value as a food. From the leaves the Africans make roofs for their huts; ropes are made from the fibrous parts of the stalks; and the sap furnishes a stimulating beverage.

Day is the most natural unit of time and may be defined as the period of rotation of the earth relative to any selected heavenly body. Relative to the sun it is called the *solar day*. Relative to a fixed star it is called the *sidereal day*. Owing to irregularities in the earth's movements, the time taken for the earth to rotate through 360° relative to the sun is variable, and so the *mean solar day* of 24 hours has been introduced, which is the average throughout the year. The *mean solar day* is our standard, used for purposes of the calendar, and astronomers use *sidereal* clocks to check mean solar time. In practice, for convenience, the sidereal day is determined by the earth's rotation relative to the vernal equinox or first point of Aries, and is equal to 23 hours 56 minutes and 4·091 seconds of mean solar time (*i.e.*, about 4 minutes shorter than a solar day). Around 600 million years ago, a day was only 21·9 hours long.

The lengths of day on other planets can differ greatly to that of the Earth. Jupiter spins once every 10 hours or so while the length of a day on Venus is equal to 243·01 Earth days, longer than its year of 224·7 days. *See* **Time.**

DDT (dichloro-dephenyl-trichloroethane). A very powerful insecticide which has had wide success in the control of diseases, such as malaria and typhus which are carried by insects. Mosquito swamps are sprayed with DDT to kill the carriers. Because this toxic chemical breaks down very slowly it builds up in birds and animals and its use is now banned in Britain. Its detection in Antarctic wild life confirmed that DDT pollution was virtually worldwide.

Dead Languages include the ancient Greek and Latin tongues, which are no longer spoken in everyday usage but are preserved in literature.

Deadly Nightshade. *See* **Belladonna.**

Dean, a Church of England dignitary, ranking below a bishop, and the head of the chapter of a cathedral. A Rural Dean supervises a *deanery*.

Death Penalty. The last British executions were in 1964. Capital punishment was abolished for murder in 1969 and for all offences in 1998. In 2010, at least 23 countries around the world held judicial executions, while 139 have abolished the death penalty. In 2013 Maryland became the 18th state in the USA to abolish the death penalty. (only Texas, Georgia and Missouri now regularly use the death penalty.) The number of global executions is at its highest for many years.

Death Watch Beetle (*Xextobium rufovillosum*), a wood-boring beetle, larger than the common furniture beetle, found chiefly in the old oak beams of churches and other historic buildings. The grub bores from 4–12 years. The name "death watch" comes from the superstition that the ticking sound, made by the beetle striking its head against the wood, is a sign of approaching death.

The death watch beetle found in the roof of Westminster Hall was smoked out by means of an insecticide called gamma benzine hexachloride. *See also* **Furniture Beetle, Woodworm.**

December, the last month of the year in our calendar, and the tenth in the old Roman.

Decibel, the name of the unit used to measure the relative loudness of sounds. The unit denotes the ratio between two amounts of electric or acoustic power. Named after Alexander Graham Bell, its symbol is db.

Deciduous Trees are such as shed their leaves at certain seasons as distinguished from evergreens or permanent foliaged trees or shrubs.

Deckchairs. A patent for these adjustable folding chairs was taken out in 1886 by the Englishman John Thomas Moore. Manufacture first began in Macclesfield in Cheshire.

Defender of the Faith (*Defensor Fidei*), the title conferred upon Henry VIII by Pope Leo X in 1521 for entering the debate against Luther with his pamphlet in defence of the Seven Sacraments. After Henry assumed headship of the Church of England the Pope withdrew the title but it was confirmed to him by Parliament in 1544 and has been used ever since by English monarchs.

Dehydrate, to eliminate the water from a substance. The process of dehydration is now widely used in the food industry in making such things as dried egg and packet soups. Most vegetables contain over 90 per cent of water, and much of this can be removed under vacuum at low temperatures without impairing the flavour.

Deliquescence, the process of dissolving by the absorption of moisture from the atmosphere. For instance, chromic acid crystals on exposure to the air quickly deliquesce.

Democratic Party, one of the two great American political parties, originated about 1787, advocating restrictions on the federal governments and in opposition to the federalists. It was in 1825 that a group who were in favour of high tariffs seceded, later to become the Republican Party.

The Democratic Party was split again over slavery before the Civil War (1861–65), and in the main the southern states have been loyal supporters of the Democrats. The economic depression helped the Democrats to power in 1932 (*see* **New Deal**) and they held office until 1953 when Eisenhower became President.

In 1960 Kennedy just won the Presidency and in 1964 Lyndon Johnson swept in with a landslide victory over the Republican candidate. In 1968 and 1972 the Democratic candidates were beaten by Nixon. In 1976 Jimmy Carter won an easy victory, but after that the Democrats lost three successive presidential elections (1980, 1984, 1988) before winning a narrow but convincing victory under Bill Clinton in the 1992 election. It won again in 1996. The bitterly-divided 2000 presidential election resulted in a narrow Republican victory. A further defeat in the 2004 presidential election was finally put behind them when the Democrats won an historic victory in 2008 under Barack Obama. They won a narrow but decisive victory in 2012. Hillary Clinton became the first woman to lead her party into a presidential election. She was defeated by Donald Trump (although she won more of the popular vote).

The symbol of the party is a donkey, invented by the cartoonist Thomas Nast.

Dendrochronology. The science of establishing the age of trees. *See* **Tree Rings.**

Dendrite, a stone or mineral on or in which tree-like tracery appears, the result of the action of the hydrous oxide of manganese.

Density, a measure of the mass per unit volume of a material, usually expressed in grams per cubic centimetre. *Specific gravity* is the ratio of the density of a material at the termperature under consideration to that of water at the temperature of its maximum density (4°C). In grams per cubic centimetre the density of gold is 19·3, silver 10·5, lead 11·3, water 0·99997, air 0·00129.

Depression, a region where barometric pressure is lower than that of its surroundings. These areas of low pressure are usually less extensive than anticyclones (*q.v.*) and may vary from hundreds to thousands of kilometres in diameter. The winds, often of gale force where the depression is deep, blow round the system in an anticlockwise direction in the Northern Hemisphere (in the reverse direction in the Southern Hemisphere). Well above the earth's surface the winds blow along rather than down the pressure gradient but near the surface, friction causes the winds to blow slightly (*c.* 15°) across the isobars. The depression exists only as long as more air diverges out of its upper parts than converges into its lower parts.

Most depressions which cross the British Isles travel from the Atlantic, sometimes in series or families at rates from a few kilometres to a thousand kilometres a day, bringing their generally unsettled weather with them.

Derby, The, the most famous flat race for 3-year-old colts. First run at Epsom Downs on 4 May 1780. The most successful Derby jockey is Lester Piggott (9 wins). The largest Derby field was 34 in 1862 (a maximum of 20 was set in 2003). It is Britain's richest horse race. *See* **Section S.**

Desalinisation, the process of It is Britain's richest horce race. Minerals, chiefly salt, from sea or brackish water to pro-vide pure water for drinking or industry. Small-scale desalinisation by distillation has been practised for many years on ships and small islands. By the 1960s, many large-scale distillation plants were in operation, many of them in hot dry countries as in the Middle East. Kuwait, for example, used oil revenues to buy desalination plant and powers the plant with natural gas. As water for large population centres becomes more precious and desalinisation techniques more efficient, the process may be more and more used though it is expensive in capital outlay and in the cost of heating required to distil the water. Worldwide 80 million cubic metres of desalinated water are now produced daily.

Deserts, vast, barren, stone or sandy wastes where there is almost no rainfall and little or no vegetation (although their eco-systems are more complex than once thought).

These regions are found in the interior of the continents Africa, Asia and America between 20° and 30° north and south of the equator. Europe is the only continent without deserts. The most famous are the Sahara, the largest in the world, the Gobi desert of central Asia, the Kalahari desert of south-west Africa and the great Australian desert (the second largest in the world). The Atacama desert in Chile is the driest in the world. The Sahara is larger than either Australia or the United States. The Gobi desert is the most northerly in the world. Some 6,000 years ago the area was still wet.

The growing extension of deserts (desertification) is thought to result from both climatic change and also human interference.

Détente. Diplomatic term signifying the relaxation of strained relations between states. The term is usually applied to the improved relations, beginning in 1969, between the Warsaw Pact countries (led by the USSR), and the West (headed by the USA), which were inaugurated by SALT (the Strategic Arms Limitation Talks). These ended in agreement on arms reductions in May 1973. The continued build-up of Soviet arms and the invasion by the USSR of Afghanistan in 1979 questioned the validity of détente. The tension was finally eased with the fall of Communism.

Deuterium or "heavy hydrogen". The second isotope of hydrogen; the third is called tritium. Deuterium atoms have in their nuclei a neutron as well as a proton; tritium nuclei have two neutrons and one proton. In ordinary hydrogen gas about one out of every 5,000 atoms is a deuterium atom. Deuterium was discovered in 1932 by Professor Harold Urey. The oxide of deuterium corresponding to water is called "heavy water". The nucleus of the deuterium atom is called a deuteron. An anti-deuteron consisting of anti-proton and anti-neutron was produced at Brookhaven in 1965, the first compound anti-nucleus ever to be produced.

Devonian System in geology refers to the strata between the Silurian and the Carboniferous formations. It includes the Old Red Sandstone formation. The fauna of the Devonian include the group of fishes known as the Rhipidistra (on the evolutionary route towards the amphibians), Actinistia (coelacanth), and the Dipnoi or lung fishes.

Dew, moisture deposited by condensation of water vapour on exposed objects especially during calm, cloudless nights. The loss of heat from the ground after sunset, by radiation, causes the layer of atmosphere close to the surface to be chilled below the temperature (the dew-point) at which the air is saturated with vapour. Part of the vapour condensed may be transpired from blades of grass and foliage of plants.

Dew Pond is a shallow artificial pond which is on high ground and rarely dries up, even during prolonged droughts, despite being used by cattle and sheep as a drinking source. The name arose from the belief that dew deposits at night provided the moisture for replenishment. Drainage of rainwater and mist condensed on neighbouring trees and shrubs are probably more important factors.

Diamond, a mineral, one of the two crystalline forms of the element carbon (the other is graphite), the hardest known substance, used as a gem and in industry. India was the first country to mine diamonds (the Koh-i-noor, which means "mountain of light", known since 1304, came from Golconda near Hyderabad and came into British possession when the Punjab was annexed in 1849). The diamond mines of South Africa were discovered in 1869.

Other important diamond producing countries today are Russia, Congo, Botswana, Australia, Namibia, Angola and Tanzania. The world's biggest diamond used to be the Cullinan I (or Great Star of Africa) discovered near Pretoria, South Africa, in 1905. Since 1990 it has been the Golden Jubilee (now set in the King of Thailand's sceptre). Diamonds can be made artificially by subjecting carbon to very high temperatures and pressures; many industrial diamonds are made this way.

Antwerp is the main diamond centre of the world, London the main marketing centre, Amsterdam the main diamond cutting centre.

A planet composed almost entirely of diamond was found in 2011, 4,000 light years away!. And scientists now believe such outer planets as Uranus and Neptune could have diamond in their cores.

Diatoms. One-celled algae, common in fresh and salt water. Distinctive feature is the siliceous wall which is in two halves, one fitting over the other like the lid of a box. These walls are often very finely and beautifully sculptured. The diatoms constitute a class of the plant kingdom known as the Bacillariophyta. *Diatom ooze* is a deep-sea deposit made up of diatom shells. *Diatomite* or *diatomaceous earth* is the mineral form that such diatom oozes assume (sometimes known as kieselguhr which mixed with nitroglycerine yields dynamite).

Diesel Engine, an engine in which the liquid fuel is introduced into a compressed or partially compressed charge of air, and which does not need an extraneous source of ignition. The modern oil engine has been evolved mainly from the principles enunciated by Herbert Akroyd-Stuart in his patent of 1890 and, like the steam and other inventions, represents the improvements achieved by many men, including those by Rudolf Diesel of Germany, in respect of high compression pressures and greater fuel economy.

Diffusion is the process of mixing which occurs when two liquids or gases are in contact. It is most rapid between gases, and, as laid down by Graham's law, "the rates of diffusion of different gases are in the inverse proportion to the square roots of their relative densities". Diffusion arises through the continual movement of molecules. Even in solids diffusion can occur. If a block of gold and a block of silver are welded together, after some time particles of gold are found in the silver, and *vice versa.*

Digital Television. *See* **Television**.

Dimensions in common speech are the magnitudes of length, breadth and thickness giving, the size of an object, thus a line has only one dimension: length; a plane surface two: length and breadth; and a solid three: length breadth and thickness.

In mathematics, hypothetical objects with any number of dimensions are considered. In physics and mechanics, dimensions are numbers which relate the units in which any quantity is measured to the so-called fundamental units. The latter are usually but not necessarily those of length, mass and time.

Dimorphism, the quality of assuming two distinct forms. For instance, carbon, which is graphite in one form, is the diamond in another.

Dingoes, often considered the native dog of Australia, are in fact a unique species. Their future is in doubt because so many are kept as pets and mate with other breeds. Australia's largest land predator. Also known as the warrigal.

Dinosaur, the name given to a group of extinct reptiles of the Mesozoic period, some of which were of immense size. Modern research suggests that a huge asteroid impact 60 million years ago, rather than volcanic activity ended their 160 million year reign. It is believed that dinosaurs began the evolution into birds. The earliest dinosaur bones date back over 250 million years. Dinosaurs were the most successful animals the world has known (dinosaur remains have even been found under Antarctica). In 2014, a 'super-massive' species of dinosaurs was discovered in Argentina. Tyrannosauros rex, one of the most feared dinosaurs, had serrated teeth that could tear through bone and sinew. Around 50 different dinosaur species have been found in the UK. *See* **Diplodocus.**

Diplodocus, one of the best known of the extinct mammoth dinosaurs. Fossil remains have been discovered in the Jurassic rocks of the United States. Some reached a length of over 24 m.

Dipnoi *or* **Lung Fishes.** These have the air bladder adapted to function as a lung, and they can remain alive when the stream or marsh in which they live dries up. Species of lung fish occur in Australia, Africa and S. America.

Dippers are Britain's only aquatic songbird.

Diptera, an order of insects. Their main characteristic is that they are two-winged, and the common house-fly is the best-known example. There are at least 50,000 species of these insects, including gnats, blow-flies, mosquitoes and tsetses.

Diptych was a folding two-leaved tablet of wood, ivory, or metal, with polished inner surfaces, utilised for writing with the style by the ancient Greeks and Romans. The same term was applied to the tablets on which the names of the persons to be commemorated were inscribed in the early Church. *See* **N6**.

Discus, a circular piece of metal or stone about 30 cm in diameter, used in athletic contests by the ancient Greeks and Romans. Throwing the discus was a very favourite game, which was deemed worthy of celebration in Myron's famous *Discobolus* (*c.* 460 B.C.–450 B.C.).

Disk, an astronomical term for the seemingly flat surface of celestial bodies as seen by the eye.

Distillation, a process used to separate liquids of different boiling points. This is effected by placing the mixture in a distillation apparatus and heating. The liquid with the lower boiling point distils over first, the vapour being condensed and collected, forming the first *fraction.* With continued heating the second liquid reaches its boiling point, distils over and the mixture is said to be *fractionated.* Mixtures of liquids with close very high boiling points require more elaborate apparatus.

Fractional distillation is a common process in the chemical industry (*e.g.* petroleum refining).

DNA (**Deoxyribonucleic Acid**), a polymer molecule in the form of a double-strand helix containing many thousands of sub-units. Contains the genetic information coded in sequences of sub units called bases. The Nobel Prize for medicine was awarded in 1962 for the discovery of the structure of DNA. *See* **Human Genome Project, Nucleic Acids.** and **T46–8.**

DNA Database. The world's first police DNA database was established at the Forensic Science Laboratory, Birmingham in April 1995. The database allows police to compare genetic material from crime scenes with DNA profiles of convicted criminals. DNA profiling has been developed from genetic fingerprinting, an earlier technique pioneered in the mid-1980s by Sir Alec Jeffreys of Leicester University.

Docks are enclosed water spaces where ships rest while being loaded or unloaded, repaired, or waiting for cargo. There are three main types: the wet dock in which water is maintained at the level of high tide so that vessels remain afloat while loading and unloading; the tidal dock, with open entrance to permit free ebb and flow of tide (*e.g.*, Glasgow, Southampton (which has double tides)); and the dry dock, or graving dock, for overhauling and repairing vessels, so constructed that, after a ship has been docked, the water can be drawn off (*e.g.*, Southampton, Tilbury). The floating dock is a type of dry dock. Advances in the handling of cargo, *e.g.*, containers, have led to modernisation. Under the 1991 Ports Act many ports were privatised.

Dodo, an extinct flightless bird (more slender than once thought), which lived on the island of Mauritius up until *c.* 300 years ago. Another species, the white dodo, lived on Réunion. By the end of the 17th cent. Mauritius, Rodriguez, and Réunion had all been colonised, and the dodo along with many other birds vanished forever because of their inability to stand up to man and the animals imported by him. In *c.* 150 years 45 species were lost forever.

DNA scientists have found that the Nicobar pigeon of SE Asia is the dodo's nearest relative. Scans of a dodo skull have revealed that the dodo was a relatively wise bird with an unusually enhanced sense of smell.

Dog-days, a period of 40 days (3 July–11 August) when Sirius (the Dog Star) rises and sets with the sun. The ancient superstition found in Greek literature, was that this star affected the canine race.

Dogfish, a large family of small sharks, seldom more than 1 m in length. The flesh is sold as "rock salmon". The eggs are contained in horny cases called "mermaid's purses". The commonest of the British dogfishes are the spurdogs.

Doldrums, a nautical term applied to those areas of the Atlantic and Pacific within a few degrees of the Equator towards which the trade winds blow and where the weather is calm, hot and sultry. Pressure is low and the air often rises to produce heavy tropical rainfall and squalls, rendering navigation difficult.

Dolomite, a limestone containing appreciable magnesium; also the mineral dolomite, a double cabonate of magnesium and calcium.

Dolphin, a mammal of the whale order, from 2–2·4 m long, with a long, sharp snout, and of an active disposition. They abound in most seas and swim in shoals. A few species live in large rivers (Ganges and Amazon). They can cruise for long periods at around 15 knots and produce bursts of speed in the region of 20 knots, the water apparently flowing smoothly past their bodies. Dolphins are some of the most intelligent of mammals and are the subject of scientific experiments in language and communication. They are masters of teamwork when searching for food. Dolphins use echoes (the skill known as echolocation) and also electric sensors to locate food or detect other creatures. Scientists now know that dolphins stun their prey by blasting them with sound. Dolphins are the only animals apart from humans to develop a natural form of Type 2 diabetes. They also call each other using individual signature whistles, in much the same way as human beings use names. Thankfully, the last British dolphinarium closed in 1993.

Dominicans, an order of mendicant preaching friars founded by St. Dominic in Languedoc in 1215 and confirmed by the Pope in 1216. The rule of the order was rigorous. The dress was a white habit and scapular with a long black mantle. This gave them the name of Black Friars. Their official name is Friars Preachers.

Donjon, the keep, or inner tower of a castle, and the strongest and most secure portion of the structure. This was the last refuge of the garrison, and there was usually a prison on the lower floor, hence the name *dungeon.*

Don Juan, the legendary hero of many famous works, supposedly based on the life and character of the unscrupulous gallant Don Juan Tenorio of 14th-cent. Seville. The first dramatisation of the legend and the most famous is Tirso de Molina's *El Burlador de Sevilla.* Don Juan was also the subject of Molière's *Le Festin de Pierre*, Mozart's *Don Giovanni*, Byron's *Don Juan*, and José Zorilla's *Don Juan Tenorio.* The latter is played on All Saints' Day throughout Spanish-speaking countries.

Don Quixote, the "knight of the doleful countenance", the hero and title of Cervantes' classic novel of 16th-cent. Spain. Don Quijote de la Mancha, a gentle country gentleman of lofty but unpractical ideals, having read many chivalric romances, believes he is called upon to redress the wrongs of the world. Mounted on his nag Rosinante and accompanied by his companion Sancho Panza, a hard-headed peasant, he sets out on his journeys of knight-errantry.

Dormouse, a family of small, squirrel-like rodents widely distributed throughout Europe and Asia, and living mainly on fruit and nuts. It is nocturnal and sleeps through the winter. One of nature's most secretive creatures, it is threatened with extinction in parts of Britain. The hazel dormouse is particularly threatened by habitat loss. However, the edible dormouse is a threat to our countryside.

Dotterel, a handsome bird of the plover family found in northern Europe and Siberia.

Downing St, one of the most famous streets of London, off the west side of Whitehall. The official residence of the Prime Minister is at no. 10; that of the Chancellor of the Exchequer at no. 11. The public is now excluded from the street, named after an MP, George Downing (*c.* 1623 84).

Drachm (or **Drachma**), an ancient Greek silver coin and weight. One drachma was equivalent to six obols. The word has survived as the name of a weight: Avoirdupois, one-sixteenth part of an ounce; Apothecaries' Weight, one-eighth part of an ounce.

Draco. *See* **Flying Lizard.**

Drag. Term used in mechanics for resistance offered by a fluid to the passage of a body moving through it. When speed of sound is reached drag increases abruptly. The lift/drag ratio gives the aeroplane designer his measure of aerodynamic efficiency.

Dragon, a fabulous monster common to folk-lore in most countries; generally represented as a winged reptile with fiery eyes and breath of flame. A dragon guarded the garden of the Hesperides; St. George, England's patron saint, is supposed to have overcome the dragon; in heraldry the dragon has also a conspicuous place; and in China it was the imperial emblem.

Dragonet, the name of the fish of the *Callionymus* genus, beautifully coloured, and about 30 cm in length. They are common on the British coast and in the Mediterranean.

Dragon Fly, the common name of a well-known order of insects having two pairs of membraneous wings, and often of very brilliant colours. They are swift of flight and may be seen hovering over sheets of water in the sunshine all through the summer. Emperor dragonflies are the UK's biggest and fastest insects. They can reach speeds of 20 mph. Today, they are threatened by pollution and invasive species.

Dragon's Blood, a dark-red resinous substance obtained from the fruit of a Malay palm, and possessing medicinal virtues. In a special technique used for making line blocks in printing, dragon's blood is used.

Drawbridge, a bridge that can be lifted up so that no passage can be made across it. It was a usual feature of a fortified castle in the Middle Ages, and was raised or lowered by chains and levers. It spanned the fosse, and on the approach of an attacking party was raised and formed a special barricade to the gate. Modern drawbridges are such as are raised to allow of the passage of boats up and down a river or estuary. The Tower Bridge is a famous London bridge of this type.

Driving Standards Agency, the national body responsible for driving tests for cars, lorries, buses *etc.* It also supervises approved driving instructors.

Driving Test. The cost of a car driving test rose to £62 from April 2009 (£75 for evenings and weekends). The driving test for car drivers now takes around 40 minutes. The first driving test in the UK took place on 1 june 1935. Driving licences were standardised across the EU from 2012. At age 70 drivers face a mandatory renewal each three years (it is planned to raise this to 75). The separate driving test for taxi drivers is to be scrapped.

Drongo. The King Crow or Indian Black Drongo is frequently seen in India perched on branches or telephone wires, darting suddenly to catch insects and to attack crows and hawks. Other members of the family are found in Asia, Africa and Australia. Its plumage is black with steel-blue gloss. It is an exellent mimic.

Drosophila or **Fruit Fly.** More has been learnt by geneticists from breeding experiments with this insect than with any other.

Drought occurs when there has been an absence of rain for a long period or a marked deficiency of precipitation over a much longer period in a climatic zone where precipitation is ordinarily adequate for vegetation or agriculture, river flow and water supplies. It is different from *aridity* which refers to the extreme dryness of desert or arid regions where rainless periods characterise the climate. Hitherto in the British Isles "an absolute drought" was defined as "a period of at least 15 consecutive days without measurable rainfall".

In the British Isles droughts occur from time to time but very long rainless spells at a place are rather rare. The longest recorded spell in the British Isles with no measurable daily rainfall lasted 61 days at Liss (Hants) from 16 March to 15 May 1893. Over the country as a whole the 12-month period beginning 1 May 1975 was the driest such period since records began. The South of England faced water restrictions in 2006 after 2005 was the third driest year on record since 1897. In many places the summer of 1995 was the driest since records began in 1727. Prolonged drought causes long-term changes to woodlands.

Drupe is the scientific term for stone fruit. The stone forms the inner part (*endocarp*) of the fruit, and encloses a seed or kernel which is liberated after the flesh part (*pericarp*) rots.

Dry-rot, the term was first used about 1775 to describe the fungal decay of timber in buildings. Creosote distilled from coal tar is the standard material for preservation of timber, and pentachlorophenol and copper naphthenate are two compounds now extensively used. Dry wood always escapes dry-rot. Chief fungi causing dry-rot are *Merulius* and *Poria*.

Duck, water bird smaller than the related goose and swan, which together form the family Antidae. Duck refers to the female, drake to the male. The duck family falls into two separate groups: the river or freshwater (surface feeding) ducks, such as the mallard, pintail, wigeon, shoveler, mandarin, teal, garganey; and the sea (diving) ducks, such as the goldeneye, pochard, scoter, eider, and the fish-eating mergansers or "sawbills". The ancestor of all domestic breeds, with the exception of the muscovy, is the mallard (now in serious decline).

Duckbill, *Ornithorhynchus anatinus*, also duck-billed platypus, a fur-covered, egg-laying, nest-building mammal native to Australia and Tasmania. It has webbed feet and a muzzle like a duck's bill and is about 50 cm long. Adopted as the mascot for the 2000 Olympic Games in Sydney, but its numbers are declining. DNA evidence has now revealed it really is an amalgam of mammal, reptile and bird.

Duckweed is the world's smallest flowering plant (and one of the fastest growing).

Ductility is a property possessed by most metals which renders them capable of being stretched without breaking. Gold is the most, and lead the least ductile of metals, the order being gold, silver, platinum, iron, copper, palladium, aluminium, zinc, tin, lead. The spider and the silkworm produce secretions of notable ductility.

Dugong. A marine mammal, belonging to the order Sirenia (sea-cows). Inhabits the Red Sea and Indian Ocean; also found as far East as the Philippines and Australia (where most are to be found). Lives on sea-weed. Related to the Manatee.

Duke, the highest rank in the British peerage. Edward, the Black Prince, eldest son of Edward III, who died before his father, was the first English duke, being created Duke of Cornwall in 1337. Since then all Princes of Wales have held that title.

Dukeries, a stretch of English woodland and park country, mainly in Nottinghamshire, comprising the adjacent demesnes of several English dukes and nobles. The Dukeries include Sherwood Forest and the estates of Welbeck Abbey, Clumber Park, Worksop Manor and Thoresby Hall.

Dunes. Sand dunes are elliptical or crescent-shaped mounds of loose sand produced by wind action. The dune has a gentle slope on windward side; a steep slope on the leeward side.

Dung Beetle, known for feeding on faeces. It can pull more than 1,000 times its own body weight.

Dunlin, very common small wading-bird of the Sandpiper family nesting in Britain. Its range extends to other areas where it also breeds.

Dunmow Flitch, a custom which originated in the parish of Little Dunmow, Essex, in the reign of Henry III, which was that the husband who was prepared to swear before the prior, convent, and townsfolk of Dunmow that he had not repented of marriage or quarrelled with his wife for a year and a day, should be rewarded with the gift of a flitch of bacon.

Dunnock (*Prunella modularis*), a small bird of rich brown and dark grey plumage common in gardens and hedgerows. Sings a cheerful song all the year round. Called the hedge-sparrow in southern England. Another member of the same family, the larger Alpine Accentor (*Prunella collaris*), is found on rocky mountain slopes.

Duodecimo, a sheet of paper folded into twelve leaves, written "12mo".

Durian, a pungent fruit, popular in S.E. Asia. Its smell is horrendous and it inhibits the breakdown of alcohol.

Dust, solid particles of matter floating in the atmosphere, produced chiefly by volcanic eruptions, sand-storms in desert regions, and industrial and domestic smoke. When the island of Krakatoa erupted in 1883, more than 4 km^2 of dust was thrown into the air and carried three times round the earth by the explosive wave. The particles in dust-storms are much finer than those in sand-storms and are swept up to far greater heights. The local whirlwinds which form over loose dry soils are termed dust-devils.

Dutch Elm Disease. *See under* **Elm.**

Dwarf Planets. *See* **T8–9**.

Dyke. A wall-like intrusion of igneous rock which cuts across the bedding or other layered structure of the country rock; the word also signifies in alternative usage, a sea-wall and an open drain.

Dynamite, a powerful explosive whose chief element is nitro-glycerine. It was discovered by Nobel in 1867, who absorbed nitro-glycerine in kieselguhr. It has a disruptive force of about eight times that of gunpowder.

Dynamo. Machine for transforming mechanical energy into electrical energy. Depends on principle of electromagnetic induction whereby a current is produced in a conductor (*e.g.*, copper wire) traversing a magnetic field.

The two essential parts of a dynamo are the conductors or *armature* and the *field magnets*.

E

Eagle, large bird of prey with huge hooked bill, related to the buzzard, kite, hawk, harrier, falcon and vulture, together forming the family *Falconidae*. There are many species to be found throughout the world, the Golden, Imperial, Tawny, Spotted and Lesser Spotted being found in Europe. The Golden Eagle, a magnificent-looking bird, nests in the Scottish Highlands. The White-tailed Sea Eagle, which used to breed in Britain, is now rare here.

The eagle has been the symbol of royal power for over 5,000 years, and the American or Bald Eagle is the emblem of the United States. Bald eagle numbers have now revived.

Eagre. *See* **Bore.**

Earl, a British title of nobility of the third rank, duke and marquis coming first and second. The title dates from Saxon times, and until 1337 ranked highest in our peerage.

Earl-Marshal, in England ranks as the eighth of the great officers of state, is head of the College of Arms, attends the sovereign in opening and closing the session of Parliament, arranges state processions (especially coronations) and assists in introducing newly created peers in the Lords. The office is hereditary in the Dukes of Norfolk.

Earth, our habitable globe, is the third of the planets of the solar system in order from the sun and on an average throughout the year takes 24 hours to turn completely round relative to the sun, the whole earth revolving round the sun in a slightly elliptical orbit once in a year of 365·2564 days. The mean distance of the earth from the sun is 149,597,900 km.

Modern earth satellite studies have shown that small variations of the surface gravity field (or geoid) occur which are believed to be related more to the structures deep within the earth's mantle than to the location and dimension of crustal features, such as oceans, continents etc.

The crust of the earth consists of a skin, 30 km thick under the continents, but only about 6–8 km thick under the ocean bed, comprised of rocks and sediments or soil. At the base of the crust is a sharp discontinuity (the Mohorovičic Discontinuity) to denser rocks of the mantle. This region, nearly 3,000 km thick, is in a process of slow but inexorable change, one of convection responding to heat sources (due mainly to radioactivity of the materials within the earth). This slow convection is responsible for many changes in the surface of the earth—continental drift (*q.v.*), earthquakes and volcanic activity.

The core is a region of very high density and temperature, comprised of heavy elements such as iron and nickel. The crustal rocks are mainly comprised of oxygen, silicon, aluminium, sodium, potassium, iron, calcium and magnesium, with traces of many other elements. The mass of the earth is *c.* 6,000 million million million tonnes, and it was formed *c.* 4,567 million years ago (some scientists believe *c.* 4,467 million years ago).

Earth has only one natural satellite, the moon. *See* **Section V.**

Earthquake, a sudden violent disturbance of the earth's crust; the region of the surface immediately above the "focus", or source where the earthquake originates, is termed the "epicentre". On account of their destructive power earthquakes have attracted attention from the earliest times, but accurate study dates only from the 19th century and the development of a world-wide network of recording stations.

The majority of severe earthquakes result from fractures, usually along existing faults, in underlying rock strata subjected to great strains, the shearing movement sometimes extending to the surface. These dislocations set up vibrations which are propagated as waves throughout the bulk of the earth or round the crust. Often the main shock is followed by smaller aftershocks.

Minor local earthquakes may be attributed to the effects of volcanic activity, but most of the larger ones originate in nonvolcanic regions along well-marked lines of weakness in the earth's crust. Generally the ground is felt to tremble, undergoing oscillations which may gradually or suddenly increase and accompanied by sounds.

When there is movement of the sea-bed a tsunami (*q.v.*) may result. One of the most devastating of modern times (9·3 on the Richter scale) took place on 26 December 2004 under the Indian Ocean. Its epicentre was near northern Sumatra. Over 220,000 people died (and unknown thousands went missing) in its wake. Earthquakes may add to global warming by releasing greenhouse gases from the ocean floor.

Among the notable shocks of the 20th century and after were those of San Francisco (1906), Messina (1908), China (1920), Japan (1923), Napier, New Zealand (1931), Ionian Is. (1953), Chile (1960), Iran (1962), Yugoslavia (1963), China (1976), Mexico (1985) Armenia (1988), N.W. Iran (1990), Los Angeles (1994), Kobe (Japan), 1995, Turkey and Taiwan (1999) and Christchurch, New Zealand, 2011. The most devastating earthquake in recorded history hit Shanxi (China) in 1556, killing 830,000 people. The 1755 Lisbon earthquake was the most powerful to hit Europe.

Research has suggested that the collapse of the walls of Jericho in biblical times was due to an earthquake. In the last 100 years, one million people have died in earthquakes. In 2015, Nepal suffered severe damage. *See* **Richter Scale**.

Earthworm, of which there are 25 native species in the UK, has a cylindrical body, tapering at both ends and segmented into rings. It moves by contraction of its rings, aided by retractive bristles; is eyeless, but has a mouth, gullet and stomach. Earthworms exist in immense numbers, and perform an important part in the scheme of nature by loosening the soil and rendering it more amenable to tillage. They also form a valuable food for birds and many mammals, and are unequalled as bait for certain kinds of fish. The New Zealand flatworm (now spreading in Britain) is devouring native earthworms.

Earwig, a genus of insects possessing two pairs of wings and anal forceps. It is nocturnal, lives on vegetable matter, and hides by day under stones or in flowers, *e.g.*, dahlias.

Easter, the annual Christian festival in commemoration of the resurrection of Christ, the English name being derived from Eostre, goddess of Spring. The date cannot fall earlier than 22 March nor later than 25 April. Many disputes arose among the early Christians as to the proper time to celebrate this day which governs all other movable feasts. It was eventually ruled at the Council of Nicaea in 325 that Easter Day should be the first Sunday after the full moon following the vernal equinox. If this happens to be a Sunday, then Easter Day is the Sunday after. A fixed date for Easter is now under consideration.

For dates of Easter, *see* **G25**.

Eau-de-Cologne, a popular distilled perfume first manufactured at Cologne in the 18th cent. by Johann Maria Farina, an Italian.

Ebony, a name applied to various hard black woods, the best of which are grown in Mauritius and Sri Lanka. There are also Indian and American varieties. Only the inner portions, the heartwood, of the trees are of the necessary hardness and blackness. Ebony is largely used in ornamental cabinet work, for piano keys, *etc.*

E-books are digital editions of books which can be downloaded to your home computer. They can be read on an E-reader device (*e.g.* Kindle from Amazon or iPad or Nook). More recent devices include the iPadmini, Kindle Fire and Surface.

Ecce Homo ("Behold the Man!"), the pictures and sculptures depicting Christ crowned with thorns.

Echidna, the spiny Australian anteater.

E-cigarettes. Around 2·8 million people in Britain use vaping in an attempt to give up smoking. E-cigarettes are 95 % safer than tobacco, with no serious side-effects found so far.

Eclipse, the partial or complete obscuring of one heavenly body by another. An eclipse of the sun occurs when the moon, which is 1/400th of the diameter of the sun and about 1/390th as far away, obscures some portion of the sun as seen by an observer on the earth. A total eclipse occurs when the whole of the sun's disc is covered by the moon. Astronomers travel many thousands of miles to observe the outer layers of the sun and its corona, which is only possible when the light from the sun is totally obscured by the moon during the few minutes of an eclipse.

The spectacular solar eclipse of 11 August 1999 and the partial eclipse of 20 March 2015 attracted great attention (being Britain's first major solar eclipses for 70 years). Previous total solar eclipses occurred over parts of the UK in 1424, 1433, 1598, 1652, 1715, 1724, 1927 and 1954 (visible from the Shetland Is.). A similar magnitude solar eclipse to 2015 will not occur until 12 August 2026.

The next total eclipse visible from the UK will not occur until 23 September 2090. An eclipse of the Moon occurs when the Moon moves into the Earth's shadow. When this happens, the sunlight is cut off and the lunar surface becomes quite dark until it emerges from the shadow again. Lunar eclipses can be either partial or total, depending on whether all or part of the Moon moves into the Earth's shadow. They are more common than solar eclipses.

The longest solar eclipse this century (6 mins., 39 seconds) swept across Asia in July 2009. It will not be surpassed until 13 June 2132.

On 6 June 2012 there was a Transit of Venus (when Earth, Venus and the Sun all line up and the planet's disc travels across the face of our star). The next transit is not until 2117.

Ecliptic is the sun's apparent path in the sky: the great circle described by the sun from west to east in the course of a year. The sun is exactly on the equator on approx. 21 March, and 23 September, and the points where the celestial equator and ecliptic intersect on these days are called the *equinoctial points.* On approx. 21 June and 22 December the sun reaches its greatest and least midday elevation and its greatest distance north and south of the equator. The points on the ecliptic on these days are called the *solstices*.

These four points are equidistant from each other by 90°. The angle of the ecliptic to the earth's equator is called the obliquity of the ecliptic. Due to the gravitational perturbations of the other planets, both the equinoctial point and the obliquity of the ecliptic change with time. The value of the obliquity is *c.* 23·5.

Ecology, a term first described by the German biologist Haeckel in the 19th cent., is the study of the inter-relationships between living organisms and their environment. **Autecology** is the study of the environmental relationships of *individual* plants and species. **Synecology** is the study of plant and animal *communities* living together as groups. *See also* **Section T**.

Ecumenical Council, a general council of the Christian Church summoned when important questions of Church doctrine and policy are to be decided. The early councils were predominantly Greek and convoked by the emperor. Those sumoned by the pope when they meet at the Lateran Palace in Rome are called Lateran Councils; others have met at Constance, Florence, Trent and the Vatican. Their decisions are not binding on the rest of Christendom. Only 21 Ecumenical Councils have been held in the history of Christendom. The first was held at Nicaea in 325 when the mystery of the Trinity was defined.

The 21st (known as the 2nd Vatican Council), convened by Pope John, opened in October 1962 in St. Peter's, Rome, and ended in December 1965.

Edda, the name given to two important collections of early Icelandic literature—*the Elder or Poetic Edda*, poems handed down from the 9th and 10th cent., probably Norwegian in origin, and the *Younger* or *Prose Edda* of Snorri Sturluson compiled about 1230. They treat of legends of an early Scandinavian civilisation.

Eddystone Lighthouse, 21 km south of Plymouth, is one of the most isolated in the world. The tower is 51 m high, and its light can be seen for 28 km. The present structure is the fourth that has occupied this dangerous position. The first was of wood, completed by Winstanley in 1698, but it was destroyed by storm in 1703. In 1708 a second and stronger lighthouse was built by Rudyerd. This lasted until 1755, when it was destroyed by fire. Smeaton built the third lighthouse of granite and this withstood storm and tempest for over a hundred years, 1759–1881. The present lighthouse, also of granite, was built 1879–81 on a nearby rock by Sir James Douglass.

Eden Project, a giant greenhouse in Cornwall. Opened 2001, it recreates climates for over 10,000 species. A series of domes (biomes) creates environments from arid deserts to the world's largest indoor rainforest. It now plans to build a pioneering geothermal plant.

Eels, edible fishes of the order Apodes, with snakelike body covered with minute scales embedded in the skin. The common or fresh-water eel *Anguilla anguilla* is found in the Atlantic coastal areas of N. America and Europe and in the Mediterranean, and breeds S.E. of Bermuda. The electric eel of S. America is able to cause electric shocks. Commercial sand eel fishing in the North Sea and elsewhere is depriving many birds, fish and marine mammals of their food.

Eel numbers are now declining due to loss of habitats, pollution and changes to ocean currents caused by global warming. The European eel, found in British rivers and streams, has declined by 90% since the 1980s. The last eel fisherman in England was forced to stop work in 2016.

Eels can make epic journeys of 4,500 miles to their spawning grounds. The hatched larvae make the return journey floating on ocean currents. The tiny juveniles are known as glass eels.

Egret, a slender, graceful bird of the heron family, of pure white plumage, famed for its beautiful silky plumes (aigrettes), which appear in the breeding season, and for which it was ruthlessly hunted and would have been exterminated had not international action been taken to protect it. The Little Egret with black bill, black legs, and yellow feet breeds in Mediterranean lands.

Eider, a large diving duck, found along the rocky coasts of northern latitudes, well known for the beautifully warm soft down, called "eider down", which the female bird plucks from her breast to line her nest. In Norway and Iceland the haunts of the eider are preserved and the birds protected by law on account of the much prized "eider down", which is collected from the nests just before the breeding season.

Eider down" is so elastic that a kilogram of it will fill an ordinary bed covering.

Eiffel Tower, built by the French engineer Alexandre Gustave Eiffel (1832–1923) for the Paris Exhibition of 1889. The tower which is made of iron is 300 m high and weighs *c.* 7,000 tonnes. Now Europe's most popular tourist site.

Eisteddfod (a sitting) was originally a congress of Welsh bards and minstrels, and dates from before the 12th cent. These assemblies, discontinued for a long period, were resumed in 1819, and have been held yearly since, each lasting three or four days. Their object is to foster the Welsh patriotic spirit; they are devoted to orations and competitions in poetry, singing and harp-playing. Prizes are awarded.

Eland, largest species of antelope, native of Africa; large pointed horns, stands 1·5 m high at the withers, and weighs several hundred kg.

Elder, small trees of the *Sambucus* genus, with pinnate leaves, and clusters of white flowers and, later, small purplish-black berries. The black elder, the best known, thrives in Britain. A wine is made from its berries. Once regarded as sacred.

El Dorado, a "golden land", was an idea very much favoured in the days of the early Spanish explorers. It was believed that somewhere on the South American continent there was a country abounding in gold and precious stones. Many expeditions were fitted out to discover it. Sir Walter Raleigh also embarked on this quest.

Electret, a piece of solid matter which retains a permanent electric polarisation analogous to the magnetic polarisation of a permanent magnet. There are various recipes for making them; carnauba wax is a common constituent.

Electricity. *See* **Section T** and **Energy Conversion.**

Electric Telegraph may be said to date from 1836, when Sir Charles Wheatstone and his co-inventor Cooke introduced their Single-Needle instrument, which was soon followed by the Double-Needle apparatus. Morse, in 1837, invented his famous recording instrument. The first electric cable was between Dover and France, and was laid in 1850. The first Atlantic cable was laid in 1858, and the second in 1866.

It was in 1899 that the very first Marconi wireless telegraph messages were sent between England and France.

Electroencephalograph, an instrument which records the minute voltages produced by the electrical activity of the brain by means of electrodes taped to the scalp. The record of brain waves, known as EEG, shows that there is a general cycle of activity in the brain that underlies both sleep and wakefulness.

Electrolysis is the condition established when an electric current passes through a conducting substance, between electrodes, resulting in decomposition and separation into constituents. Water thus becomes decomposed into hydrogen and oxygen.

Electromagnetic Radiation. Radiation consisting of oscillating electronic and magnetic fields travelling together through space. Including visible light, the speed of travel is around 300,000 kms per second. Together with visible light, many different types exist including gamma rays, X-rays, ultraviolet and infrared radiation, microwaves and radio waves.

Electromagnetic Waves. *See* **Section T**

Electron. *See* **Section T.**

Electronics. The science which deals with the behaviour and control of free electrons. It started with the discovery of the electron by Sir J. J. Thomson in 1897. The practical applications, constituting electronic engineering, have given us radio, radar, photo-electric cells, cathode-ray oscillographs, electronic microscopes and television. Electronics uses devices like transistors such that the electrons move inside solid matter instead of *in vacuo*. This is sometimes referred to as "solid state electronics". *See also* **Microelectronics.**

Electron Microscope. A microscope in which beams of electrons are focused by magnetic lenses in a manner analogous to the focusing of light beams in the ordinary optical microscope. Modern electron microscopes have very high resolving power and can magnify up to 1,500,000 times, making it possible to explore the cell and the virus. A development of the electron microscope is the scanning electron microscope (stereoscan), developed at Cambridge, which can examine an essentially thick object, giving a very large depth of focus.

Electronvolt, unit of energy used in nuclear physics. It is the amount of energy required to move one electronic charge through a potential difference of one volt. It is very small—$1{\cdot}6 \times 10^{19}$ joules—and therefore suited to atomic physics. 1 MeV = a million electronvolts; 1 GeV = a thousand million electronvolts; these larger units are used in high energy physics.

Elementary Particle, one of the basic constituents of the material universe. The idea that matter consists of tiny particles goes back to classical times but the modern concept of the atom grew out of the chemistry and physics of the 19th cent. With the discovery of the electron in 1897 and the rise of nuclear physics in the 20th cent., the chemical atom was understood to be a structure built of even more fundamental particles—the electron, the proton and the neutron. In the last few decades, many more particles have been discovered, especially in the study of cosmic rays and by the use of large accelerating machines like those at CERN (Geneva) and Brookhaven National Laboratory (Long Island, New York). Among the later discoveries are the neutrino, the positron, the antiproton, the muon, the pion *etc.* These differ in electric charge and mass and other intrinsic properties and many have only a very short lifetime before they change into something else. Whether there is a small number of really elementary particles out of which all the others can be constructed is an unanswered question of contemporary physics. *See* **Section T.**

Elements. In chemistry, substances which cannot be separated into two or more simpler chemical substances. 91 elements are found naturally on the earth, some are observed spectroscopically in the stars and planets, and a further number have been made artificially. Between them these elements can appear in some 1,200 different isotopes, of which 317 occur in Nature. (There are 274 stable isotopes among 81 stable elements.) *See* **Table of Elements, T56**.

Elephant, a proboscidian mammal of which only two species survive—the Asiatic, in India, and the African elephant. No other animals possess a trunk. Both males and females have large ivory tusks.

The Indian elephant is usually *c.* 2·7 m high and weighs about 3 tonnes; African elephants are larger, weighing about 6 tonnes, and are usually much fiercer. Several fossil elephants of still larger bulk have been discovered, including the mammoth and the mastodon. The Indian elephant is domesticated and used as a beast of burden, and may live 70 years. The ivory trade (banned in 1989) was responsible for the mass slaughter of perhaps 700,000 elephants. This evil trade still continues clandestinely. Nowadays less than 50,000 Asian elephants still survive, with perhaps 352,000 African savanna elephants. One hundred years ago there were *c.* 5 million African elephants. Elephants are famed for their memory (they never forget) but they are the only mammal that cannot jump. Their memory (of where to find water or food) is a key to their survival. They also pick up noise through their feet. Despite their size, elephants will turn tail and flee at the sound of a swarm of bees. They have a remarkable sense of smell. They are also excellent swimmers. The rumbling sounds they produce are an important form of communication.

The world's smallest elephant (the Bornean) is strictly a sub-species and much endangered.

Elephant Bird, the largest bird which ever lived. A flightless creature, indigenous to Madagascar, it was more than 10ft tall, weighing over 1,000 lbs.

Elephant Seal. *See* **Sea Elephant**.

Eleusinian Mysteries, festivals common throughout ancient Greece, agricultural in their symbolism.

Elgin Marbles, a collection of ancient Greek sculptures and architectural fragments got together by the 7th Earl of Elgin and brought to England between 1802 and 1812. These celebrated treasures had originally formed part of the Parthenon at Athens, and were probably carved by pupils of the sculptor Phidias. Lord Elgin expended over £70,000 upon them, and they were purchased for £35,000 for the British Museum.

In 1997 the Labour Government ruled out their return. However, one possible compromise would be their return on loan to Greece.

Elk, the largest animal of the deer family, with enormous antlers, and standing, when mature, about 2 m high. The American moose is of the same family.

Elm, a stately, wide-spreading tree having some 20 species spread over north-temperate regions, several of which are native and peculiar to Britain. The grandest of the field elms is the English elm, *Ulmus procera*, which may reach a height of *c.* 42 m and a girth of 8 m. The wych elm, *U. glabra*, or Scots elm, is a valuable hardwood and used in boat-building. The fungus that causes Dutch elm disease is carried from tree to tree by a bark beetle. The fungus came from infected veneer logs from central Europe. Ironically the disease was named after the Dutch workers who discovered its cause! Since re-entering Britain in 1963, Dutch elm disease has caused the death of many million trees. Genetically-modified elms, resistant to the disease, are now being developed.

El Nino, a climate phenomenon that has caused extreme weather, floods and droughts (as well as pushing global temperatures higher). It results from the interaction of the ocean and atmosphere in parts of the Pacific. Some years have been especially badly affected (1982-83, 1997-98).

Elzevir, the name of a celebrated family of Dutch printers, who produced editions of Latin, French and German classics, which were highly valued for their beauty of type and accuracy of printing. They flourished in the 17th cent.

Ember-days are set apart for fasting and prayer in the Western Church, at the periods appointed for ordination, viz., the Wednesday, Friday and Saturday after the first Sunday in Lent, Whit-Sunday, 14 September (Holy Cross Day), and 13 December (St. Lucia's Day).

Emerald. The rich green variety of beryl (beryllium aluminium silicate). The colour is due to the presence of chromium oxide.

Emu, a towering, flightless bird. A protected species which appears on the Australian national coat of arms alongside the kangaroo.

Encaenia, a festival commemorating a dedication; at Oxford University the annual commemoration of benefactors, accompanied by the conferring of honorary degrees, is held in June.

Enceladus, Saturn's sixth largest moon. Its wrinkled landscape and spouting jets suggest underground waters, which could harbour life. These enormous geysers from its south pole blast ice and vapour hundreds of miles into space.

Encryption, the sending of messages written in code. The term is now used in computing.

Encyclical Letters, a term used in reference to letters addressed by the Pope to his bishops upon matters of doctrine or discipline.

Encyclopaedists, a term first applied to the eminent writers who collaborated in the French *Encyclopédie* (1751–65). They included Diderot, D'Alembert, Voltaire and Helvetius; their works had great influence in popularising the social ideas which resulted in the French Revolution.

Energy. One of the most fundamental concepts of science. A body in motion possesses *kinetic energy* as a result of the *work* done by the forces creating the motion. But a force which does work to stretch a spring does not create motion. Instead, the work is stored up in the spring and is one example of *potential energy.* A raised body also possesses potential energy which turns into kinetic when the body falls. The *heat energy* contained in a body is the sum of the kinetic and potential energy of the constituent atoms which are vibrating all the time. Heat and motion are obtainable from electrical, magnetic, chemical, atomic, and other sources, and physicists therefore define corresponding forms of energy.

All forms of energy are transferable into one another *without loss or gain.* This is the Law of Conservation of Energy. It is one of the most fundamental laws of science, and its general validity is the reason why energy is an important idea. Since Einstein, it has been recognised that mass also is interchangeable with energy. *See also* **Nuclear Energy.**

Energy Conversion. For practical purposes it is frequently necessary to change energy from one into another of its many forms; indeed almost every activity does this in one way or another. The primary sources of energy are the sun, uranium and other elements from which nuclear energy can be drawn, and the tides. The sun is not much used *directly* because its heat is intermittent and not very intense, but solar cookers and refrigerators have been invented and solar batteries (*q.v.*) are used in spacecraft. The sun can be used *indirectly* because it has produced, *via* living processes, fossil fuels like coal and oil and still continues to generate winds, rain and rivers and hence hydroelectric and wind power. Commonly both fossil fuels and the energy of river or tidal waters are converted into electricity. Windmill type electricity generators are also common.

The bulk of electricity production is a two-stage process: first fossil or nuclear fuel is used to create heat (*see* **Nuclear Reactors**); then the heat is used to raise steam and drive generators. Efforts are being made to convert heat into electricity more directly, *e.g.*, by using thermoelectric or thermionic effects (*q.v.*), but these have not been used for large-scale production. Once electrical energy is available, factories can make chemical batteries in great numbers and these can then be used as portable energy sources, as can petrol and other refined forms of fossil fuel. *See* **Battery, Fuel Cell, Solar Battery.**

Enthalpy, another name for the heat content (H) of a system in thermodynamics. If a system generates heat it is presumed that the heat comes from the enthalpy of the system which by the 1st law of thermodynamics thus falls. It can be combined with the entropy (S) in an equation which defines the important thermodynamic quantity called the Gibbs Free Energy: G = H − TS where T is the thermodynamic temperature. G is important in the prediction of chemical change.

Entropy, one of the most important quantities in thermodynamics, symbol S. According to Clausius' statement of the Second Law the entropy of an isolated system cannot decrease. Although introduced by Clausius it arose from a consideration of Carnot's studies of the limitation of the convertibility of heat into work. It is most easily viewed as disorder in the statistical approach introduced by Boltzmann. This may be illustrated by considering the separate sets of coloured balls in a box. This is an ordered arrangement (of low entropy). The natural tendency is for the balls to mix and for the colours to become disordered (of higher entropy). We do not expect the opposite process for the balls to spontaneously separate, *i.e.*, we do not expect the entropy to decrease. In the context of energy changes, say in heat engines, the entropy change is equal to the heat change divided by the (thermodynamic) temperature.

Enzymes. Organic catalysts which accelerate chemical processes occurring in living organisms. There are a large number present in the cell, and most have a high degree of specificity. Enzyme mechanisms are the key to basic biological processes. *See* **Section T.**

Ephemoptera or **May-flies,** are an order of insects. In the larval condition they exist from two to three years aquatically, but no sooner do they arrive at maturity than their lives are hurried to a close. They swarm up on warm summer nights, take no food, propagate and perish.

Epic of Gilgamesh. The 3,000 year-old Mesopotamian poem which recounts the mythical adventures of King Gilgamesh. It recounts the story of a great flood.

Epigenetics is the study of how gene behaviour changes.

Equator, the imaginary great circle of the earth, every point of which is 90 degrees from the earth's poles, and dividing the northern from the southern hemisphere. It is from this circle that the latitude of places north and south is reckoned. The celestial equator is the circle in which the plane of the earth's equator meets the celestial sphere (the imaginary sphere, in which the observer is at the centre, used for representing the apparent positions of the heavenly bodies).

Equinox, the time when the sun crosses the plane of the earth's equator, making day and night of equal length. These occur on about 21 March and 23 Sept. *See* **Ecliptic.**

Eras are distinctive periods of time associated with some remarkable historical event or personage. *The Christian era* is computed according to a 6th-century. reckoning to begin with Jesus's birth, A.D. 1. Scholars now believe that Jesus was born *c.* 4 B.C. The *Jewish era* dates from 3761 B.C.; the *Julian era* from the alteration of the calendar by Julius Caesar in 45 B.C.

The *Muslim era* dates from the *Hejira*, or the flight of Mohammed from Mecca to Medina, which is A.D., 622, 16 July, in the Julian Calendar.

Erbium, a rare-earth metal, discovered by Mosander in 1842. Element no. 68, symbol Er.

Erg, the unit of work and energy in the centimetre-gram-second system; the energy involved when a force of 1 dyne moves its point of application through a distance of 1 cm.

Eris (**Xena**), now classified as a dwarf planet (*see* **T9**). Eris was the Greek goddess of chaos and strife. It has a moon, Dysnomia and is the largest dwarf planet.

Ernie, the name given to the "electronic random number indicator equipment", the electronic machine which selected the prizewinning numbers in the first Premium Bond draw, June 1957. (The original Ernie is in the Science Museum).

The lowest value Bond to win £1 million was a £3 Bond bought in February 1959 which won the prize in July 2004. The cap on Premium Bond investments was raised to £50,000 in June 2015. Premium Bonds can no longer be bought at Post Offices.

Eros. This asteroid is 24–32 km in diameter. It comes closer to the earth than any other member of the solar system with the exception of the moon and several very small asteroids.

Determination of solar parallax based on observations of Eros in 1930–31 yielded until then the most accurate estimate of the distance of the sun from the earth. *See* **Astronomical Unit.**

Erse, a term used by Lowland Scottish, and English writers for the Gaelic language spoken in the Highlands of Scotland. Sometimes erroneously applied to Irish, the Gaelic language as spoken in Ireland and revived as an official language in more recent times. Dr. Johnson, Sir Walter Scott, and other writers used "Erse" to signify Scottish Gaelic. The language of the Scottish Lowlands (that used by Robert Burns) is related to the English language and not to Gaelic and is variously termed Scots, Braid Scots, Doric, Scottish vernacular, and Lallans.

Escurial or **Escorial,** Spanish monastery built in the mountains near Madrid by Philip II to commemorate the victory over the French at Saint-Quentin (1557). A palace was added later.

Eskimo. Popular name for the Inuit peoples of the Arctic, living in Canada, Greenland, Alaska and the northern territories of Russia. Canada has granted self-government to an Arctic Eskimo territory (Nunavut) (effective from 1999). Their lifestyle is now threatened by global warming.

Esperanto, an artificial international language created by Ludwig Zamenhof of Warsaw and first published in 1887. It does not seek to replace national languages but to serve as a second language for international communication. It is based on the internationality of many words in the principal modern languages, and is entirely phonetic in spelling and pronunciation.

There are over 200 artificial languages including Volapuk, Ido, Glosa and Tutonish.

Estates of the Realm in Britain are the Lords Spiritual, the Lords Temporal and the Commons.

Esters. Organic chemicals formed by combining an alcohol with an acid. They have a pleasant smell, and occur naturally in plants as the scent of flowers. Manufactured for use in the perfumery industry, and as flavourings in food. Some esters are used as solvents, notably amylacetate ("pear drops") in quick-drying paints. The polymeric fibre "Terylene" consists of chains of molecules containing many ester groups, formed by reacting an alcohol having two alcoholic (OH) groups with an acid having two acid (COOH) groups.

Ether, in chemistry, is a volatile inflammable liquid composed of carbon, hydrogen and oxygen. It is a valuable anaesthetic obtained by heating alcohol with sulphuric acid. In physics, in the 19th cent., all space was supposed to be filled with a substance called ether, the chief property of which was to carry light waves, *i.e.*, light was supposed to be waves in this all-pervading medium known as the ether. Speculation and experiment concerned with the ether were very fruitful in advancing physics. Ultimately the attempts by Michelson and Morley to detect the motion of the earth through the ether were unsuccessful in this respect but profoundly successful in stimulating the theory of relativity. The ether concept has now been abandoned.

Ethylene (also called ethene). A gas compounded of carbon and hydrogen, it is related to acetylene and ethane. Industrially it is obtained as a by-product in petroleum refining. It has wide uses as a starting material in the industrial manufacture of intermediates, especially alcohol. Its most important application is in the production of polythene (poly-ethylene). *See* **Catalyst.**

Etruscans, people now known to have come from Asia Minor who colonised Italy about 900 B.C., settled in what is now Tuscany and part of Umbria, reached the height of their civilisation about 500 B.C. They built a network of states stretching from the Alps to Naples. They were skilled technicians in bronze, silver and goldwork. Evidence of their advanced civilisation was unearthed in 1998 beneath the ruins of Pompeii. The language of the Etruscans has only partly been deciphered.

Euro, the name for the single European currency launched on 1 January 1999. From 1 January 2002 the new notes and coins replaced old currencies in the 'eurozone'. On 1 January 2011 Estonia became the 17th country to join. Slovenia joined in 2013 and Latvia in 2014. Lithuania became the 19th eurozone member in January 2015 (the last of the Baltic States to join).

Europa, fourth largest moon of the planet Jupiter, (*q.v.*) on which scientists believe the preconditions for life could exist. NASA is planning further missions to Europa. Instead of a solid surface, Europa is covered in a 10-mile thick layer of brittle ice, below which liquid salty oceans have been found. Plumes of water vapour erupting from near the South Pole have now been observed. Surface temperature is -145°C. Europa has a system of plate tectonics similar to Earth.

European Space Agency was created in 1975 with headquarters in Paris. Examples of space research which it has undertaken include the Giotto probe to Halley's Comet, involvement with the Cassini mission to Saturn and the space station Spacelab. It has launched a number of satellites including X-ray multi-mirror telescope (XMM) and Cluster II satellites. ESA has also launched a number of satellites in its four 'cornerstone' missions, including solar astronomy (STEP), Far Infrared Space Telescope (FIRST) the Rosetta cometary mission and XMM. In 2016 the ESA published the most complete map ever of the stars.

Europium, element no. 63, symbol Eu, discovered by Demarcay in 1906. A rare-earth metal.

Evaporation is the process by which a solid or liquid is resolved into vapour by heat. The opposite process is condensation. Wherever a liquid or solid surface is exposed, evaporation takes place into the space above. If the vapour is continually removed the solid or liquid vanishes into vapour; the higher the temperature the quicker the process. If the vapour is confined, then it collects, getting more concentrated until as many atoms of vapour are condensing as are evaporating. The vapour is then said to be saturated. Evaporation of water from the sea, soil, plants, skin, *etc.*, is continuously in progress.

Event Horizon. The boundary of a black hole beyond which nothing returns. *See* **Black Hole.**

Everest Expeditions. For many years after Everest had been shown to be the highest mountain in the world, political conditions in Nepal, lying south of the summit, and in Tibet, to the north, prevented mountaineers from attempting an ascent. At last in 1921 the Tibetan authorities gave permission, and the first expedition, organised by the Royal Geographical Society and the Alpine Club, was sent out. This was primarily a reconnaissance; besides mapping the northern flanks, it found a practicable route up the mountain. By 1939, six further expeditions had climbed on the northern face. Some were baulked by bad weather, others by the effect of high altitudes on the human body.

Nevertheless, some important climbs were accomplished. In 1924, for example, Colonel E. F. Norton reached 8,589 m, and it was on this expedition that George Mallory and Andrew Irvine were seen going well at about the same height. They never returned, however. The body of Mallory was eventually found in 1999.

When the 1953 Expedition led by Col. John Hunt (later Lord Hunt), was being organised, stress was laid on three main points; proper acclimatisation of the climbers; use of oxygen for the final stages; and the establishment of very high altitude camps, so that the final assault parties would set out fresh and unencumbered. Great attention was also paid to recent developments in diet, clothing and equipment.

In all these matters the 1953 expedition was able to draw on the accumulated experience of its predecessors. By the end of April, a base camp had been established below the ice-fall.

The next critical stage was the ascent of the steep head of the cwm, the Lhotse face, with the threat of avalanches always present. By most strenuous efforts, a camp was established on the South Col (7,869 m) on 21 May. From this camp on 26 May, T. D. Bourdillon and R. C. Evans climbed the South Peak of Everest (8,760 m),then the highest altitude ever attained. On 28 May Edmund Hillary and the Sherpa leader, Tenzing Norgay, spent the night at the highest camp (8,510 m) and on the following day, 29 May, climbed to the South Summit, negotiated the difficult final ridge, and reached the summit of Everest. On 17 May 1993 (exactly 40 years later) Rebecca Stephens became the first British woman to conquer Everest (the first-ever woman to climb Everest was the Japanese Junko Tabei on 16 May 1975).

Since 1953, around 283 people have died trying to climb Everest and over 7,400 have climbed it.

The Chinese (whose official name for Everest is Qoomolangma) claim they first mapped the peak in 1717. They say Everest is 8,844 metres high.

Evolution, The theory, as laid down by Darwin, is that all existing species, genera and classes of animals and plants have developed from a few simple forms by processes of change and selection.

Up to the time of Darwin many believed that life had been created suddenly at the beginning of the world which God had created, according to Archbishop Usher, on 22 October 4004 B.C.

The evidence of the rocks, however, has given a proper, scientific theory of creation, and by studying the fossils preserved in the various layers of the earth's crust the past history of the earth has been pieced together. Darwin has been called the Newton of biology. *See* **Section V.**

Exchequer, which derives its name from the checkered tablecloth on which accounts were calculated in early Norman times, is a term connected with the revenues of the Crown. In former times it had jurisdiction in all revenue matters. The term Exchequer is now applied to the Governmental department which deals with the public revenues.

Exoplanets *see* **T9.**

Exploration. Modern exploration began in the second half of the 15th cent. with the voyages of the great Portuguese and Spanish discoverers. They were followed by sailors of other European nations, who profited from their developments in navigation and from their charts, and in less than one hundred years the coastlines of much of the Americas, Africa and SW Asia had been revealed and the globe circumnavigated.

The motives of these early explorers were mixed: they were seeking adventure, trade, plunder, national power and conversion of the local people. Few if any were directly interested in advancing scientific knowledge. But from the reports of their voyages, scholars at home compiled descriptions of the new worlds.

One of the earliest English expeditions to be despatched for scientific research was that of William Dampier on the *Roebuck*, which was sent out by the Admiralty in 1699 to examine the coasts of North-west Australia. In the 18th cent. British explorers were at work mainly in the Pacific Ocean, with the object of breaking the Spanish monopoly of trade. Capt. James Cook sailed thither in 1769 to observe first the transit of Venus at Tahiti, and then to search for the alleged great southern continent. On this voyage he discovered and charted much of the coasts of New Zealand and the east coast of Australia. On his second voyage he was the first to sail across the Antarctic Circle, and he showed that the southern continent was much smaller than had been supposed.

By 1800 the outlines of the continents, except for Antarctica were known, and explorers in the 19th cent. were largely engaged in opening up the interiors. In Africa British explorers solved two problems which had puzzled men for centuries: Mungo Park and Richard Lander established the true course of the River Niger, and Sir Richard Burton, J. H. Speke, Sir Samuel Baker and others revealed the true sources of the Nile. The greatest African explorer of that age was undoubtedly David Livingstone, the missionary, who in three great journeys explored the Zambesi and the Great Lakes, spreading Christianity and fighting the slave trade.

In North America Alexander Mackenzie was the first to cross the main breadth of the continent from sea to sea. In Asia famous explorers included Charles Doughty, who explored in Arabia, and Sir Francis Younghusband, who journeyed across the Gobi and the Himalayas.

Explosives, substances which burn violently to produce gases in such volume that an explosion is induced. Gunpowder was the first explosive to be used; Roger Bacon's powder, consisting of charcoal, sulphur and saltpetre, was the only effective explosive until the 19th cent., but it was difficult to control. Nitroglycerine (glyceryl trinitrate) was first compounded in 1847 by adding glycerine to a mixture of sulphuric acid and nitric acid. In 1866 Alfred Nobel discovered how to make dynamite by absorbing nitroglycerine in the fine sand kieselguhr. Cordite was the joint invention of Sir Frederick Abel and Sir James Dewar (1889).

It came into general use as a propellant. High explosives, providing bursting charge for shells and bombs, include TNT (trinitrotoluene), picric acid, cyclonite (RDX) and many others. Slurry explosives can be pumped on to the site and therefore offer advantages in transportation and safety; they are also waterproof.

Chemical explosives have now been eclipsed by nuclear explosives.

Expressionism. *See* **Section N.**

F

Fables are fictitious narratives intended to enforce some moral precept, and may be either in prose or verse, and deal with personified animals and objects or with human beings. Aesop in ancient times and Hans Christian Andersen and the Brothers Grimm (in many of their stories) in later days, have given fables. Mention must also be made of La Fontaine and Krylov.

Fairs were established in mediaeval times as a means of bringing traders and customers together at stated periods, and formed the chief means of distribution. The great English fairs of early times were those of Winchester and Stourbridge near Cambridge. Traders from the Netherlands and the Baltic gathered there with the great merchants of London, and goods of every kind, wholesale and retail, were sold.

One of the biggest trade fairs was at Nijni-Novgorod, founded in the 17th cent.; other big continental fairs were those of Leipzig (founded in the 12th cent.), Lyons and Prague.

Fairy Rings are the circles caused in grassland by certain fungi. The circles expand outwards as the fungus spreads, the fruiting bodies being at the periphery. Farther inward where the fungi are decaying the grass grows more strongly, fertilised by the nitrogen released from the rotting fungi. Once these rings were held to be the scene of fairy dances.

Falcon, name given to diurnal birds of prey which belong to the same family, *Falconidae*, as the hawk, eagle, buzzard, kite and harrier. They are swift of wing and feed on birds and small mammals. These birds have long, pointed wings, strong, hooked and notched bill, long, curved claws and an eye of great power. They are found all over the world. Those that breed in Britain are the Kestrel (the most common), Hobby (one of the swiftest of European birds), Merlin and Peregrine, a swift and magnificent bird with slate-grey back, blackish crown, black "moustache" and whitish breast. The peregrine is now in decline because of pesticides getting into its food supply.

Other members of the family are the Gyr Falcon from northern latitudes, Iceland and Greenland, which is a winter visitor to Britain, the Lanner, Saker, Eleonora's falcon, Red-footed falcon and the Lesser Kestrel. The Gyr Falcon and the Peregrine were used in the sport of falconry in olden times. Because of its fearlessness and larger size, the female bird was used.

When the quarry was sighted, the bird was unhooded, set free, and after mounting high into the air would dart swiftly down to strike the prey. The heron was the usual victim.

Research has proved that diving peregrine falcons are the fastest birds in the world and that the Gyr Falcons are secret seabirds.

Fall-out. Radioactive material produced by nuclear explosions which may cause bodily and genetic damage. (1) *Local fall-out*, due to the return to earth of larger particles, occurs locally, and within a few hours after the explosion; (2) *Tropospheric fall-out*, due to particles which remain in the troposphere and come down within a month or so, possibly all over the world, but within the altitude in which the explosion occurred; (3) *Stratospheric fall-out*, which comes from fragments taken up into the stratosphere and then deposited, in the course of many years, uniformly all over the globe.

The two radioactive materials which have given rise to the greatest concern for the health of the individual are strontium-90 and iodine-131. Both these materials are liable to become concentrated in certain parts of the human body, strontium-90 in bone and iodine-131 in the thyroid gland. Radiation exposure may produce genetic effects, that is effects which may show up in succeeding generations.

An extensive survey was carried out by scientists of the US Atomic Energy Commission on the islands of Bikini atoll, site of some 23 nuclear tests, 1946–58. Their records, published in 1969, revealed that the intensity of radioactivity underneath the point of explosion was still exceedingly high. Most of the radiation remaining was due to the radioactive isotope caesium-137.

Fantail, a variety of the domestic pigeon; also a genus of Australian birds of the *Muscicapidae* family. A small New Zealand bird is called a fantail.

Fan Tracery. *See* **Section N.**

Fata Morgana, the name given to a curious mirage often observed over the Straits of Messina, attributed to the magic of the fairy Morgana, half-sister of King Arthur, who was fabled to live in Calabria.

Fathers of the Church were early writers who laid the foundations of Christian ritual and doctrine. The earliest were the Apostolic Fathers (*q.v.*).

The Four Fathers of the early Latin Church were St. Ambrose, St. Jerome, St. Augustine and St. Gregory the Great. The Four Fathers of the Greek Church were St. Basil, St. Gregory Nazianzen, St. John Chrysostom and St. Athanasius.

Fathom, a nautical measure, the six-foot stretch (1·8 m) of a man's arms. Replaced by the metre on British Admiralty charts, but continued on yachtsmen's coastal charts.

Fatigue, a condition leading to breakage when a solid component, *e.g.*, an axle, is subjected to a large number of fluctuating repetitive stresses. Fatigue is the cause of most failures in service of metal engineering components though fatigue is not confined to metallic materials alone.

Fatigue failures result from the *repetition*, not simply from the *size* of the stresses; indeed, fatigue breakage can result from stresses much lower than the material could stand if the load were applied steadily. Fatigue causes minute cracks, usually at the surface, which grow and spread. Early detection is difficult and fatigue, discovered by the engineers of the 19th cent., remains a severe engineering problem.

Fats are important foodstuffs. In physiology they constitute a valuable form of reserve food. They contain carbon, hydrogen and oxygen; chemically they are described as esters of glycerol (glycerine). The commonest fats are stearin, palmitin and olein, esters formed by the combination of glycerol with stearic, palmitic and oleic acid respectively. Fats are converted into soap by alkali; this process (saponification) also releases glycerol.

Fatwa, an edict issued by a Muslim religious leader (*e.g.* the death threat to Salman Rushdie issued in 1989 by Ayatollah Khomeini).

Fault, a term designating a breakage coupled with displacement of geological strata.

Fauvism. *See* **Section N.**

February, the second month of the year, contains in ordinary years 28 days, but in leap years 29 days. When first introduced into the Roman calendar by Numa, *c.* 700 B.C. it was made the last month of the year, preceding January, but in 452 B.C. the position of the two months was changed, February following January.

Félibrige, a movement founded in 1854 to revive the ancient glories of Provence, initiated by the French poet Frédéric Mistral.

Felspar, the name given to a group of minerals, silicates of aluminium with some calcium and sodium, or potassium, which make up probably more than half of the earth's crust. It is formed in granite and other rocks, both igneous and metamorphic.

Female Genital Mutilation (FGM), the abhorrent practice of removing the external genitalia of young women for non-medical reasons, usually between the ages of 5 and 8. Documented widely in Africa and the Middle East. Criminalised in the UK in 1985. Around 25% of all cases of FGM worldwide occur in Nigeria.

Fenestella, the niche set apart on the south side of the altar for the piscina in Roman Catholic churches.

Fermentation, the action of chemical ferments or *enzymes* in bringing about chemical changes in the materials of living animals and plants, *e.g.*, the breaking-down of sugar by yeast into alcohol.

Ferret, a domesticated polecat. It is about half the size of a cat and is bred in captivity to hunt rats and rabbits. It has a long sinuous body and short legs which enable it to enter rabbit and rat holes and chase the quarry out to guns or into nets.

Ferrites are compounds containing iron, oxygen, and one or two of a certain range of other possible metallic elements. Ferrites have become very important technically, because, unlike ordinary magnetic materials, they combine strong magnetism with electrical insulating properties. Ferrite-rod aerials became common in portable radios, and ferrite devices were used in radar.

Fieldfare, the largest member of the thrush family, a regular winter visitor to Britain from Scandinavia. It is brown in colour with a lighter spotted breast and a grey head.

Field-Marshal, the highest ranking title in the British army, and only bestowed on royal personages and generals who have attained great distinction. The first British Field-Marshal was created in 1736, when John, Duke of Argyll, had the title conferred upon him.

Fighting-Fish, small pugnacious Thai fish with long caudal and ventral fins. They are kept in glass globes in Thailand, and when brought into contact will fight to the death.

Filibuster, a name first given to pirates and buccaneers in the 17th cent. who took possession of small islands or lonely coast lands, and there maintained themselves apart from any governing authority. In later times the term was used to specify men taking part in expeditions whose object was to appropriate tracts of country, and settle upon them in disregard of international law. The most notable expeditions of this kind in modern times were those of Narciso Lopez against Cuba in 1850–51, and of William Walker against Nicaragua, between 1855 and 1860. Both leaders were captured and executed. The term is also used to express the right of a minority in the US Senate for unlimited debate, which is used on occasions to delay legislation.

Finches, a large family of small birds belonging to the Passerine or perching order of birds. There are about 200 species, including greenfinch, hawfinch, chaffinch, goldfinch, siskin, bullfinch, crossbill, linnet, twite and bunting. Finch numbers are in decline (greenfinch have suffered a disease of the mouth preventing them from feeding). Around 6 million pairs of chaffinches nest in Britain.

Fir, a cone-bearing tree with small evergreen leaves and of considerable use as timber. There are two types: the Silver Firs and the Douglas Firs numbering about 25 species. All these firs attain to a considerable height, and all yield turpentine or other resinous material.

Fire-damp. *See* **Methane.**

Fire-Fly, a small winged insect of the *Eleteridae* family, it is able to throw out a strong phosphorescent light in the dark. There are some remarkable specimens in tropical countries. They are not flies at all but beetles.

Fireworks. *See* **Explosives.**

Firkin, a former measure of capacity, the fourth part of a barrel, now only used in reference to a small cask or tub for butter, lard, *etc.*

Fischer-Tropsch Process. A process for making synthetic petrol from carbon monoxide and hydrogen. The synthesis is accelerated by cobalt-thoria and nickel-thoria catalysts.

Fish Louse. Parasitic crustacea found on marine and fresh-water fishes and whales.

Fission, Nuclear. A nuclear reaction in which the nucleus of an atom (*e.g.*, uranium 235, plutonium) captures a neutron, and the unstable nucleus so produced breaks into two nearly equal fragments and throws out several neutrons as well. In biology the term fission is applied to reproduction by fragmentation of a single-cell organism, as in amoeba.

Flagella, single hair-like projections found on many micro-organisms. Their sole function is, by complicated motion, to move the organism about. They are longer and less versatile than cilia (*q.v.*).

Flag Officer, a British naval officer who enjoys the right of carrying a flag at the mast-head of his ship, and is of the rank of Admiral of the Fleet, Admiral, Vice-Admiral or Rear-Admiral.

Flagship, the ship that flies the Admiral's flag, and from which orders proceed.

Flamingo, a strangely beautiful and extremely slender wading bird of white and rose-pink plumage with long, slender legs and neck and a long, down-curved bill with which it rakes the mud and obtains its food of worms and molluscs.

The wings are bright crimson, bordered with black, and a flock in flight is a picture of singular beauty. The lesser flamingo is shorter and darker than its larger cousin. It also has a deep red bill. There is a large and famous colony in the Camargue, S.E. France. Flamingos are pink because they eat carotene-rich brine shrimps. Flamingos eat with their heads upside down.

Flash-Point. This is found by heating an oil in a special cup and taking the temperature at which sufficient vapour is produced to ignite when a small flame is applied. It is an index of the inflammability of oils.

Flavonoids, a group of compounds, found in most fruit and vegetables, with powerful antioxidant properties.

Fleas. Fleas are small parasitic insects belonging to the order *Aphaniptera* (so called because these creatures have no wings). They obtain their food by sucking blood from their host. They are laterally compressed, which immediately distinguishes them from lice. The human flea (*Pulex irritans*) is able to jump vertically a distance of over 18 cm.

Fleet Prison, a noted debtors' prison that stood on the east side of Farringdon Street, London. It was notorious for the cruelties inflicted on prisoners, particularly under the wardenship of Thomas Bainbridge who took charge in 1728. It was pulled down in 1846.

Fleet Street, a famous thoroughfare in London, until 1990 the centre of journalism and the press, though it was long celebrated for its taverns.

It takes its name from the Fleet stream which used to run from Hampstead through Holborn to the Thames at Blackfriars.

Flemings, the Dutch-speaking people of Flanders, whose medieval ancestors excelled in the textile arts: England owes its early eminence as a manufacturing nation to the migration of numbers of Flemings to this country in the 16th and 17th cent. *See also* **Walloons.**

Fleur de Lis, the former national emblem of France, the flower of the lily. It was superseded by the Tricolour in 1789.

Flint, consists of granular chalcedony with some opaline silica, and occurs as nodules and bands in the Chalk. It is hard and has a conchoidal fracture, so enabling it to be used in making cutting implements in prehistoric times. Before the invention of lucifer matches, it was used along with steel for striking lights.

Flint implements are objects found in the younger geological strata, and constituting evidence of the condition and life of the period. They include knives, clubs, arrow-heads, scrapers, *etc.*, used as weapons, tools and possibly as surgical instruments and in religious ceremonies.

Ritual weapons and sacrificial knives continued to be made of stone long after the introduction of metals for practical purposes.

Flounder, one of the most familiar of the smaller flat fishes common round the British coasts, and seldom attaining a weight of over 1·3 kg.

Fluoridation, the process of adding the element fluorine, in the form of suitable compounds, to something deficient in it. Commonly met with as a proposal to add fluorides (fluorine compounds) to drinking water to combat dental decay, especially in children. Some toothpastes are fluoridated and fluoride can also be taken as tablets and in other ways. In 1976 a working party of the Royal College of Physicians recommended that water supplies should be fluoridated when the natural fluoride level is below 1 mg/litre. This recommendation drew on many investigations throughout the world giving evidence for the effectiveness of fluoride in the prevention of decay without harmful side-effects. There is, however, a body of opinion unconvinced by this, one argument being that to take or not to take fluoride should be a personal decision.

Fluorine, chemical element, no. 9, member of the halogen family, symbol F, it is found in combination with calcium in fluorspar, and occurs in minute quantities in certain other minerals. Discovered by Scheele in 1771, it was first obtained by Moissan in 1886. A pale yellow gas, it is very reactive and combines with most elements except oxygen. Its acid, hydrogen fluoride, etches glass, the fluorine combining with the silicon to form volatile silicon fluoride. Organic fluorine compounds have found use as very stable polymers which resist a wide variety of chemical actions.

Fluorescent Lamp. *See under* **Electric Light and Ultra-Violet Rays.**

Fluorocarbons are hydrocarbons in which some or all of the hydrogen atoms have been replaced by atoms of chlorine or fluorine. They are non-toxic, non-flammable and chemically inert gases or low boiling point liquids. These properties make them very suitable for use as refrigerants, and propellants in fire-extinguishers and aerosols. The most widely used fluorocarbons are the chlorofluoromethanes (CCl_2F_2, CCl_3F and $CHClF_2$). In 1974 it was first suggested that the vast release of fluorocarbons into the atmosphere due to the greatly increased use of aerosols could cause a significant depletion of the protective ozone (*q.v.*) layer in the upper atmosphere. The mechanism for this involves the decomposition of fluorocarbons at high altitudes as a result of intense solar irradiation. The chlorine atoms so released can then catalyse the conversion of ozone into ordinary molecular oxygen. The degree of ozone depletion that will result is a matter of current controversy. Similarly, opinions differ as to the detrimental effect ozone depletion might have on the incidence of skin cancer and on the climate.

Fluorspar, a mineral; chemically calcium fluoride. Can be colourless, green or yellow, but is most commonly purple. Blue fluorspar under the name of Derbyshire "blue John" has been used for ornamental purposes.

Fly, the popular name for a large number of insects with one pair of wings and a proboscis terminating in a sucker through which fluid substances can be drawn up. The best-known species are the common house-fly, the bluebottle and the blow-fly. In the larval form flies are maggots, and feed upon decaying substances, animal flesh, *etc.* Flies are able to walk upon ceilings or upright surfaces by having suckers at the soles of their feet. *See* **Diptera.**

Flycatcher, name of a large family of small birds, the Muscicapidae. They are insect feeders, catch their food in the air, and are distributed over most countries of the world. The spotted and the pied nest in Britain, which they visit from April to September.

Flying Fish are frequently to be seen in southern waters, and are capable of gliding considerable distances without touching the water. To build up speed for its "take-off " the fish swims rapidly, to break the surface at 24–32 km/h. Maximum air speed is about 64 km/h.

Flying Fox, the largest member of the bat family. Like other bats, it is nocturnal, but it feeds entirely on fruits.

Flying Lemur. *See* **Colugo.**

Flying Lizard, or *Draco*, an Asiatic lizard, possessing wing-like projections from each side which enable it to make flying leaps through the air, though not sufficient for continuous flight.

Flying Squirrel, rodents of which there are several species in Europe, Asia and America. It possesses a parachute-like fold of skin by means of which it projects itself through the air. In appearance they are much like ordinary squirrels, to which they are related. African flying squirrels belong to a different family.

Fog is caused by the presence of particles of condensed water vapour or smoke in the surface layers of the atmosphere, the term being applied meteorologically when the resulting obscurity is such as to render objects invisible at distances of up to 1 km. Fogs are frequently formed when the air near the ground is cooled below its dew-point temperature by radiation on a still, cloudless night; by flowing over a relatively cold land or water mass; or by mixing with a colder air stream. An accumulation of smoke over a large city may cause a high fog cutting off the daylight and producing gloom. *See* **Pollution, Aerosol.**

Foie Gras, a delicacy made from the liver of a duck or goose fattened by force-feeding. This cruel method of production is outlawed in Britain.

Foliation, a geological term for rocks whose component minerals are arranged in parallel layers as the result of strong metamorphic action.

Folio, a printing term for a sheet of paper folded once, a half sheet constituting a leaf.

Folklore concerns itself with the traditional beliefs, customs, institutions and sayings that have been handed down from generation to generation by word of mouth and with the observation, recording and interpretation of such traditions. (The word *folklore* itself was first suggested and used—as two words *Folk Lore*—by W. J. Thoms in the *Athenaeum* of 22 August 1846, and was at once absorbed into the English language.)

Traditional lore of this kind takes very many forms and ranges from omens of good and bad luck (spilling the salt, breaking a mirror, dropping an umbrella, *etc.*) and the wearing of amulets or the possession of talismans (such as the horseshoe) as protection against misfortune, to elaborate ceremonial dances such as the Abbots Bromley Horn Dance, the Hobby horses of Padstow and Minehead the Northern sword-dances and the Christmas mummers' plays. Especially important are the beliefs and customs associated with birth, marriage, death *etc.*

Another very large section of the subject of folklore deals with the traditional sayings and practices associated with particular days and seasons of the year—calendar customs, as they are called. The eating of pancakes on Shrove Tuesday; Mother Sunday customs and the simnel cake; Good Friday as the right day for planting potatoes, but emphatically the wrong day for washing clothes or cutting one's finger-nails; the necessity of wearing something new on Easter Sunday; the children's maypole dances and May garlands; midsummer fires; All Hallowe'en as the most favourable occasion for divining the future—especially in respect of marriage—and for games and sports such as apple-bobbing; the numerous practices accompanying the harvest. All these are examples of calendar customs; their full story would occupy several volumes.

Folklorists are interested in such oral tradition because they think that to a large extent it is able to assist other historic methods—ethnographical, linguistic, archaeological, *etc.*—in the elucidation of the early story of man.

The Folk-Lore Society was founded in 1878. Song and dance has its own English Folk Dance and Song Society.

Food Standards Agency, an independent watchdog set up in April 2000 by the Government to restore consumer confidence in food safety.

Foot-and-Mouth Disease, a highly contagious infection among cloven-hoofed animals with a devastating impact on farming. The 2001 outbreak devastated such areas as Cumbria. The outbreak was declared over in January 2002.

Footpath. In English law a highway over which the public have a right of way on foot only, other than such a highway at the roadside.

Force, as a term in physics, signifies an influence or exertion which, when made to act upon a body, tends to move it if at rest, or to affect or stop its progress if it be already in motion. In the c.g.s. system, the unit of force is the dyne; in the foot-pound-second system, the poundal; in the SI system, the newton.

Formaldehyde. Chemically it lies between methyl alcohol and formic acid; oxidation of methyl alcohol yields formaldehyde, and oxidation of formaldehyde produces formic acid. It is used as a disinfectant, in silvering mirrors, and in the manufacture of phenolformaldehyde plastics (of which bakelite is the best-known example). Solutions of formaldehyde in water, formalin, are used to preserve biological specimens.

Forme, a body of letterpress type, composed and secured for printing from; or a stereotype or electrotype. The former was used more for newspaper formes and the latter was used in book work.

Formic Acid can be obtained from a colourless fluid secreted by ants and other insects and plants. It is a strong irritant. Commercially it is obtained from sodium formate, which is synthesised by the absorption of carbon monoxide in caustic soda. It is used in the electroplating, tanning and textile industries.

Fossa, a solitary animal, related to mongooses. They are found in Madagascar, where they will eat lemurs.

Fossils. Remains of animals and plants, or direct evidence of their presence, preserved in rocks. They include petrified skeletons and shells, leaf imprints, footprints, *etc.*

Fox, carnivorous animal of the canine family, found in considerable numbers in most parts of the world. The common fox *Vulpes vulpes* of Europe is a burrowing animal of nocturnal habits, living upon birds, rabbits and poultry.

Among other species are the Arctic fox and the red fox of North America, of which the valuable silver fox, coveted for its fur, is a variety. An estimated 15% of foxes are now to be found in our suburbs, scavenging the streets at night (around 10,000 foxes now live in London).

The hunting of foxes with dogs in England and Wales became a criminal offence in February 2005, following successive votes to ban foxhunting by the House of Commons (and the eventual use of the Parliament Act to force legislation through). In Scotland, hunting with hounds became illegal in 2002.

Fox-Shark *or* **Thresher Shark,** a large species of shark common in the Atlantic and in the Mediterranean. It is very destructive to small fish, but although it attains a length of 4·5 m it is not dangerous to humans.

Fracking, the contentious natural gas extraction technology involving deep drilling. Large amounts of water, sand and chemicals are blasted down a well to release the gas in the shale rock below. The word is short for hydraulic fracturing. It is strongly opposed by environmentalists, but licences for fracking are being granted.

Franciscans. *See* **Friars.**

Frankincense is of two kinds, one being used as incense in certain religious services and obtained from olibanum, an Eastern shrub. It provided rich revenue for the ancient Nabatean empire. The other is a resinous exudation derived from firs and pines, and largely used in pharmacy.

Freeport, a port exempt from customs duties and regulations. The north German towns of the Hanseatic League were among the earliest and most famous freeports.

Freira, small grey and white sea bird. Extremely rare, it nests on the island of Madeira. Likely to become the first European species to face extinction since the Great Auk in 1844.

French Horn. *See* **Horn.**

Friars, members of certain mendicant orders of the Catholic Church. The four chief orders are the Franciscans or Grey Friars, the Dominicans or Black Friars, the Carmelites or White Friars and the Augustinians (Austin Friars).

Friday, the 6th day of the week, named after Frigga (Freyja), the wife of Odin. It is the Muslim Sabbath and a general abstinence day of the Roman Catholic Church.

Frigate-Bird, a web-footed bird widely distributed over tropical latitudes, and deriving its name from its great expanse of wing and forked tail, resembling the shape of a swift vessel. It feeds on flying fish mostly, being unable to dive and also steals from other birds. The male is the national bird of Antigua and Barbuda. They have a phenomenal mastery of air currents..

Frog, a familiar amphibian, breathing through gills in the earlier (tadpole) part of its existence and through lungs later. It remains three months in the tadpole stage. The frog hibernates underwater in the mud during the winter.

Britain now has only one species of native frog, the common frog (*Rana temporaria*). Frogs are now threatened by global warming which is leading to outbreaks of *chrytid* (a fungal infection). They are also threatened by ranavirus. Globally, over 170 species have become extinct in the last two decades. A frog with green blood anf turquoise bones was recently discovered in Cambodia. In Ecuador there are 492 different kinds of frogs, while 12 new nocturnal frog species were found in India in 2011. The world's tiniest frog was discovered in New Guinea in 2012. Some frogs can jump 50 times their body length!

Frost occurs when the temperature falls to, or below, 0°C, which is freezing point. Hoar frost is applied to the needles or feather-like crystals of the ice deposited on the ground, in the same manner as dew. Glazed frost is the clear icy coating which may be formed as a result of rain falling on objects whose temperatures are below the freezing point. These layers of ice, often rendering roads impassable for traffic, damaging overhead power and communication systems and endangering aircraft, can also be caused by condensation from warm, damp winds coming into contact with very cold air and freezing surfaces.

Froth-Hopper *or* **Frog-Hopper.** A family of bugs (belonging to the insect order *Hemiptera*) which in the larval stage surround themselves with a protective mass of froth ("cuckoo spit"). These insects, which suck the sap of plants, bear a faint resemblance to frogs, and the adults possess great leaping powers.

Fruit Fly. *See* **Drosophila.**

Fuel Cells were first demonstrated in action when in 1959 Bacon of Cambridge University used his fuel cell to drive a fork-lift truck and a welding machine. The Bacon fuel cell consists of two electrodes of porous nickel dipping into a solution of caustic potash in water. One electrode is supplied with hydrogen gas from an outside cylinder and the other with oxygen. These gases, forming layers on the nickel, are the active chemicals. The oxygen combines with water to make two negatively charged ions, each consisting of an oxygen and a hydrogen atom joined together (a hydroxyl ion). The hydroxyl ions travel through the solution to the hydrogen electrode, where they combine with hydrogen to form neutral water. Their negative charge (one electron per ion involved) has now arrived at the hydrogen electrode and is ready to flow back to the other electrode through any outside circuit that is provided. This flow constitutes the useful electric current, and it has been provided at the expense of creating water out of the original hydrogen and oxygen. The water can be removed as steam.

What is the advantage of all this? In the first place the fuel gases are easy to make and to store in cylinders. Supplying a new gas cylinder is easier and quicker than recharging an ordinary accumulator. Furthermore, a fuel cell is lighter for a given power than an accumulator; satellite designers have found them useful. The fuel cell is not damaged by heavy overloading, and this is valuable for application to vehicle driving. Fuel-cell-driven buses combine the advantage of diesel buses and trolleybuses.

Fulani, a people of Hamitic stock widely distributed in N.W. Africa, chiefly in Nigeria. There are two main branches: the dark-skinned Fulani, settled farmers and city dwellers, Muslim in religion; and the lightcoloured Bororo'en who are semi-nomadic herdsmen. The Fulani are different from any tribe in W. Africa though they resemble in some ways the Masai of E. Africa. The Fulani conquered the Hausa states at the beginning of the 19th cent. which passed under British suzerainty after 1903. Sokoto, built in 1810, was capital of the Fulani empire.

Fuller's Earth, a special kind of clay or marl possessing highly absorbent qualities, originally used in the "fulling"—that is, cleansing and felting—of cloth. Now used in clarifying oils. Deposits in America and also in the south of England.

Function. In mathematics, one quantity y is said to be a function of another quantity x, written $y = f(x)$, if a change in x results in some corresponding change in y. Thus $\sin x$ or $\log x$ are functions of x. If y depends not only on x but on several other quantities as well, y is called a function of many variables.

Fungi, unique class of plants, which reproduce from spores and lack the green colouring matter *chlorophyll.* It includes moulds, rusts, mildews, smuts, mushrooms, *etc.* Potato blight is a fungus disease which caused the failure of the potato crop in Ireland in 1846. Around 200,000 different fungi are known. *See also* **Section T.**

Furniture Beetle (*Anobium punctatum*). The common furniture beetle is responsible for 80 per cent of all woodworm damage and is the great pest of the comparatively modern house, causing damage in the main to softwood roofing and flooring timbers. Adults are 3 mm long. The grub tunnels for about 33 months. *See also* **Woodworm, Death Watch Beetle.**

G

Gabardine, a long, loose, coarse, over-garment, worn by the poor in the Middle Ages, and prescribed by law as the distinctive garment of the Jews. The name is now given to a cloth of wool and cotton used to make raincoats.

Gabbro, a kind of igneous rock, often very coarse-grained, containing a good deal of plagioclase felspar, and monoclinic pyroxene; it may occasionally also include biotite, magnetite, ilmenite and hornblende. A gabbro containing nickel at Sudbury in Canada is one of the richest sources known of that metal.

Gadfly, a widely distributed family of flies with only one pair of wings, including the horse fly. The females are very voracious, being able to bite through the skin and suck the blood of animals. The males are harmless.

Gadolinium. An element, no. 64, symbol Gd, belonging to the rare-earths metals discovered in 1886 by Marignac. It is strongly magnetic.

Gaelic, relating to the Gaels and their language, a term now applied only to the Celtic people inhabiting the Highlands of Scotland, but formerly also to the Celts of Ireland and the Isle of Man. A century ago, 200,000 people spoke Scottish Gaelic. Now only 60,000 do (2001 census) and the language could soon face extinction. The Scottish Parliament has now given Gaelic equal status with English as the official language of Scotland.

Gaitskellites. Members of the Labour Party who supported the moderate and reformist policies of Hugh Gaitskell (1906–63) in the late 1950s and early 1960s.

Galago, "Bush Babies", related to the lemur, native to Africa, large-eyed and nocturnal.

Galaxy (or Milky Way Galaxy), the giant star system to which our Sun belongs. On a clear moon-less night a swathe of light can be seen stretching across the sky from horizon to horizon. This dramatic sight led the ancient Greeks to describe it as a river of milk flowing from the breast of Hera, wife of Zeus—the word "galaxy" comes from the Greek word for milk. The Romans saw this as Via Lactea, or Milky Way.

The Galaxy contains *c.* 400 billion stars and has a spiral structure that is highly flattened. The stars are organised into a thin disc with an ellipsoidal bulge, or nucleus, at its centre. The system is embedded in a roughly spherical halo of stars and globular clusters. The entire Galaxy is rotating about the black hole at its centre. The Sun is situated near the inner edge of one of the spiral arms. At the Sun's distance from the centre, the rotation of the disc stars are 220 km per second. It takes the Sun 230 million years to travel once around the Milky Way. The Milky Way is up to 100 million light years in diameter. At its centre is a super-massive black hole.

The halo of the Galaxy is much less populated than the disc and its full extent is still uncertain. Many astronomers now believe there is a dark halo of unseen matter stretching out to a radius of about 100 thousand parsecs. The presence of such a halo is inferred from the manner in which the Galaxy rotates and the gravitational effect on the more distant globular clusters in the halo and on nearby dwarf galaxies.

In 2010 astronomers reported the most distant galaxy cluster yet discovered, 13·1 billion light years from Earth. In 2012 the oldest galaxy ever discovered was found by Japanese astronomers. The biggest known galaxy is IC 1011. In around 4 billion years astronomers believe the Andromeda Galaxy (twice the size of the Milky Way) will collide with the Milky Way causing total chaos. Andromeda hosts around 1 trillion stars. There are an estimated 200 *billion* galaxies, with some 1,000 times bigger than our Milky Way. The Gala space telescope will map the Milky Way. It seems our Milky Way has absorbed smaller galaxies during its life. Nine 'dwarf galaxies' have been identified orbiting the Milky Way.

Gale, a high wind now technically defined as one of at least Beaufort force 8. Between thirty and forty gales a year occur on the north and west coasts of the British Isles and only about half of this number in the south-east. At St. Ann's Head, Dyfed, the anemometer registered a gust of 113 mile/h (182 km/h) on 18 Jan. 1945, which is a record for these islands. Gusts exceeding 113 km/h are rarely experienced in London. Gale warnings are issued by the Meteorological Office.

Galileo Space Mission. *See under* **Jupiter**.

Gall, abnormal vegetable growths caused by insects, mites, bacteria, or fungi, found on all parts of the plant. Oak-apples, Robin's pincushion (on wild rose), "witches' brooms" (on trees) are examples. Some are useful commercially, *e.g.*, oak apples yield tannic acid.

Galleon, the name given to the old three-decked Spanish treasure vessels employed in conveying the precious minerals from the American colonies to Spain. The term is often applied to any large, especially stately, sailing vessel.

Galley, an oar-propelled boat used by the ancient Greeks and Romans for transport, manned by slaves. They were also used as warships. When so used the sides were raised to protect the rowers.

Gallic Acid, obtained from gall nuts, sumach, tea, coffee, and the seeds of the mango, is used in the manufacture of inks and as an astringent in medicine. It was discovered by C. W. Scheele (1742–86), a Swedish chemist.

Gallium, metallic element, no. 31, symbol Ga, related to aluminium, but which can be cut with a knife. It was discovered spectroscopically by L. de Boisbaudran in 1875. Long before Mendeleyev had predicted that an element with its properties would be found to fill the then existing gap in the Periodic Table.

Gallup Poll, a system, introduced by Dr. Gallup in the United States, for testing public opinion.

Galvanised Iron is iron coated with zinc. The name comes from the fact that such a coat protective against rust could be deposited electrolytically. Electrodeposition may be used, but the cheaper and more common process depends on dipping the iron in a bath of molten zinc.

Gamboge, a resinous gum obtained from the sap of *Garcinia morella*, a tree native to Thailand, Cambodia and Sri Lanka, and used as a yellow pigment in paints and also as a purgative.

Game is the term applied to wild animals which are protected from indiscriminate slaughter by Game Laws. In the UK game comprehends deer, hares, pheasants, partridges, grouse, black game, moor game, woodcocks, bustards and certain other birds and animals.

Game can only be killed (with few exceptions) by persons holding game licences. Occupiers of land and one other person authorised by them in each case are allowed to kill hares and rabbits on their land without licence.

Game cannot be sold except by a person holding a proper licence. There is a "close time" prescribed for the different classes of game; for instance, the selling or exposing for sale of any hare or leveret during March, April, May, June or July is prohibited by law. Grouse cannot be shot between 11 December and 11 August; partridges between 2 February and 31 August; pheasants between 2 February and 30 September; and black game between 11 December and 10 August. The shooting of grouse, pheasants *etc.* is bitterly opposed by many people.

Game reserves are legally protected areas for natural vegetation and wild life.

Gaming, *or* **Gambling**—*i.e.*, staking money on the chances of a game—differs from betting in that it depends upon the result of a trial of skill or a turn of chance. The 1959 Betting and Gaming Act replaced all the old laws on gaming, which went back to an Act of 1541 entitled "An Acte for Mayntenance of Artyllarie and debarringe of unlauful games", under which some games were unlawful if played for money in any circumstances. Roulette and any game of dice were among such games. Under the 1959 Act any game was lawful, subject to certain conditions. Since then the Betting, Gaming and Lotteries Act, 1963, and the Gaming Act, 1968, have been passed, to deal with unlawful gaming and to prevent the exploitation of gaming by commercial interests. The playing of bingo is now restricted to clubs licensed for bingo only. Sunday betting on dogs and horses became legal in 1995. Playing of fruit machines in betting shops is now legal.

The 2005 Gambling Bill proposed a major expansion of regional casinos (with unlimited jackpots). A new Gambling Commission was also proposed. Casinos would be open to the public, not operating as 24-hour membership clubs as they do now. The regulation of internet gambling is now of major concern, as in widespread advertising on TV. Addiction to gambling is soaring, particularly misuse of fixed-odds terminals. *See also* **National Lottery**.

Gamma Ray. *See* **Section T**.

Gamma Ray Bursts, intense flashes of gamma rays, detected at energies up to one million electronvolts. Measurements have revealed that the distribution of the bursts is uniformly distributed across the sky and they are thought to originate outside our Galaxy. The physical origin is thought to mark the destruction of a massive star. *See* **Black hole, Neutron star**.

Gammexane, a powerful insecticide, used particularly to kill the tsetse fly and mosquito.

Ganesh, Hindu deity made up of four creatures: man, elephant, serpent and mouse.

Gannet, a fish-eating bird which dives on its prey from a great height, swallowing it under water, is found in large numbers off the coast of Scotland, and has breeding stations in the Hebrides, St. Kilda, Ailsa Craig, the Bass Rock, Grassholme Island and on Ortac and Les Etacs (rocks off Alderney). It is a bird of white plumage, black tips to long narrow wings and wedge-shaped tail, and weighs about 3 kg. The gannet breeds in colonies on ledges of steep, rocky, island cliffs. Related to the cormorants, pelicans and frigatebirds.

Ganymede, a moon of Jupiter. It is the first moon we know which possesses an independent magnetic field. It has a thin atmospheric layer and is believed to have a deep salty ocean beneath its crust, containing more water than all the oceans on Earth. It is the solar system's biggest moon (almost the size of Mars) and a mission to explore it will be launched in 2022.

Garden Cities in England were founded by Ebenezer Howard (1850–1928), and his radical ideas were put forward in his book *Tomorrow—A Peaceful Path to Real Reform* (later re-issued as *Garden Cities of Tomorrow*). New towns should be so placed and planned as to get the best of town and country life, an adaptation of the model villages of certain industrial philanthropists such as Salt, Richardson, Cadbury, Leverhulme *etc*. The Garden City Association (later the Town and Country Planning Association) was formed in 1899, and the first garden city was begun at Letchworth in 1903 and successfully established. Welwyn Garden City (1919) was Howard's foundation. New garden cities at Ebbsfleet in Kent and at Bicester were proposed in 2014.

Gardener-Bird, a bird possessing many of the characteristics of the bower bird, found only in Papua–New Guinea. *See also* **Bower Bird.**

Gargantua, the giant hero of Rabelais' satire, of immense eating and drinking capacity, symbolical of the greed of the Church.

Gargoyle, a projecting spout for carrying off water from the roof gutter of a building. Gargoyles are only found in old structures, modern water-pipe systems having rendered them unnecessary.

In Gothic architecture they were turned to architectural account and made to take all kinds of grotesque forms—grinning goblins, hideous monsters, dragons and so forth.

Garlic, a bulbous plant of the same genus as the onion and the leek, and a favourite condiment in the famed Mediterranean diet. It has a very strong odour and pungent taste. The smaller you chop garlic, the more pungent it becomes. Giant garlic (Aglione) is odourless and also milder than common garlic.

Garnet, a group of minerals; chemically they are orthosilicates of the metals calcium, magnesium, titanium, iron, aluminium. Garnets can be coloured yellow, brown, black, green or red; the blood-red garnet is an important gemstone.

Garrotte, a method of strangulation used as capital punishment in Spain, and consisting of a collar which is compressed by a screw that causes death by piercing the spinal marrow. Garrotting was also applied to a system of highway robbery common in England in 1862–63, the assailants seizing their victims from behind, and by a sudden compression of the windpipe disabling them until the robbery was completed.

Garter. The Most Noble Order of the Garter was founded (*c.* 1348) by King Edward III, and is the premier order of knighthood in Great Britain. The traditional story associating the garter and the motto with the Countess of Salisbury, who it was said dropped her garter while dancing with the King, who said "honi soit qui mal y pense" cannot be accepted.

The Order was originally limited to the Sovereign and 25 knights, but the number has been extended, and it may now be bestowed on royal personages and leading representatives of the British peerage. The insignia of the order are the garter of dark-blue velvet with the motto in letters of gold, the mantle of dark-blue velvet lined with white silk, the surcoat and hood, and the gold-and-enamel collar. The garter is worn on the left leg below the knee and by women as a sash over the left shoulder.

Modern recipients have been the Princess Royal (1994), Sir Edmund Hillary, Baroness Thatcher (1995) and John Major (2005). *See* **Knighthood.**

Gas is an elastic fluid substance, the molecules of which are in constant rapid motion, and exerting pressure. The technique whereby gases are liquefied depends on increasing pressure and diminishing temperature. Each gas has a critical point; unless the temperature is brought down to this point no amount of pressure will bring about liquefaction. The last gas to be liquefied was helium (1908).

Gas from coal was first used as an illuminating agent by William Murdoch towards the end of the 18th cent. in Birmingham, and about 1807 was introduced in London, one side of Pall Mall being lighted with it. It became widely used as an illuminant, and for space heating and cooking. In the UK increasing attention has been paid to the use of a primary fuel—natural gas— instead of producing gas from coal or oil. Shale gas is creating vast new energy supplies.

Gas, Natural, natural mixture of gases often present with deposits of petroleum, found issuing from the ground in many parts of the world—in the oilfields of Venezuela and the Caucasus, in China, Saudi Arabia, but chiefly in North America. Its chief component is methane. Large industrial centres have made use of this gas since the latter part of the 19th cent., but much of this valuable fuel still goes to waste.

Pipelines have been constructed to deliver the gas to where it is wanted. Britain began to ship liquid methane from the Saharan oilfield in 1964. Some of the world's largest natural gas fields have been discovered in the North Sea.

Domestic gas appliances have to be modified if the natural product is substituted for ordinary town gas because the burning characteristics are different. Oil production from the North Sea fields began in 1975 and the main single source of gas in the UK is now natural gas. A new source of energy is shale gas, extracted by fracking (*q.v*). *See also* **Liquefied Natural Gas**.

Gas Turbine. In this kind of engine mechanical movement is produced by a jet of gas impinging on a turbine wheel; used in aeroplanes, locomotives and ships. These engines are mechanically simple compared with internal combustion engines, and require less maintenance.

Gauge, a standard dimension or measurement, applied in various branches of construction. Thus the standard railway gauge is 4 ft 8½ in (143·5 cm) in the UK, USA and most European countries. Russia uses the broader gauge of 5 ft (152 cm). Narrow railway gauges of different standards are in use on very steep inclines in various countries. Other standard gauges are fixed in building and gun-boring.

Gauls were inhabitants of ancient Gaul, what is now France, Belgium and parts of the Netherlands, Switzerland and Germany.

Gault, a stratum of blue clay between the Lower Greensand and the Chalk. A typical section of the Gault can be seen at Folkestone.

Gauss, a unit of magnetic induction in the cgs system, named after the great German mathematician and astronomer, K. F. Gauss.

Gazelles, a group of small, graceful antelopes which live in the drier regions of Africa and Asia. They can run very fast at speeds of over 64 km/h.

GCSE, (**General Certificate of Secondary Education**), the school-leaving examination, introduced in 1988, which replaced the existing GCE and CSE examinations. In 2013, it was announced that a new syllabus would begin in 2015, with new grades. Some axed GCSEs began to disappear from 2017.

Geckos are nocturnal lizards. The secret of their ability to scuttle along ceilings lies in the millions of microscopic hairs on their feet which harness intermolecular forces to adhere to surfaces. They are the only lizards with a voice.

Gegenschein. A faint oval-shaped glow situated at the point in the sky directly opposite the Sun and caused by the reflection of sunlight from tiny interplanetary dust particles.

Geiger Counter, an electrical device, invented by Geiger, which can detect individual atomic particles, *e.g.*, electrons, protons, *etc.* It often consists of a tube of gas at a few cm Hg pressure, fitted with two electrodes—a cylinder and an axial wire. A high voltage is kept across the electrodes, and the passage of a charged particle through the gas releases ions which permit a momentary discharge between the electrodes.

Electronic circuits register this discharge as a "count". Geiger counters are used to detect and measure radioactivity and cosmic rays both for technical and research purposes.

Geisha, traditional female entertainer of Japan.

Gelatine, a transparent, tasteless, organic substance obtained from animal membranes, bones, tendons, etc., by boiling in water. It is of various kinds, according to the substance used in making it. Isinglass, the purest form of it, is made from air-bladders and other membranes of fish, while the coarser kind—glue—is made from hoofs, skin, hides, *etc.* Its constituents are carbon, hydrogen, oxygen and nitrogen.

Gelatine is applied to an immense variety of purposes, from the making of food jellies to photographic materials.

Geminids. The name of a spectacular meteor shower which appears in mid-December each year.

Gemsbok, a large South African antelope of the open dry plains, sandy coloured with black and white markings on its face, and with long straight horns.

Generation, a time-measure reckoned at about 30 years when children are ready to replace parents; also the body of persons existing at the same time or period.

Generation, Spontaneous. *See* **Abiogenesis.**

Genes, the elementary units of heredity. They exist as highly differentiated regions arranged along the length of the chromosomes which the nuclei of cells carry. A chromosome may carry hundreds or even thousands of genes, each with its own particular structure and specific properties. The position of a particular gene on a chromosome is called its locus. The material of the gene is DNA (*q.v.*). *See* **T33**.

Genesis Mission, space probe launched in 2001. Its 3-year mission was to capture and return to Earth *c.* 10–20 micrograms of solar wind.

Genetic Code. The elucidation of the structure of DNA (*q.v.*) for which Crick, Wilkins and Watson were jointly awarded the 1962 Nobel Prize for medicine, revealed the code or chemical dictionary out of which messages serving as blueprints for living structures can be made. *See* **Human Genome Project, L54**.

Genetic Engineering is the name given to the introduction of human choice and design criteria into the construction and combination of genes. This refers not to breeding by selection, a traditional process, but to the biochemical alteration of the actual DNA in cells so as to produce novel self-reproducing organisms. Such manipulations became possible when techniques were discovered for severing and rejoining DNA molecules and inserting sections into them.

As a result, when biologists realised they could create new lifeforms, *e.g.*, bacteria, with novel genes, they appreciated that, as well as medically beneficial strains, new virulent forms might by accident be produced and escape into the world.

Human beings may in time be able to design the genes of higher animals and even of humans themselves and thus consciously influence biological evolution. *See* **T46–8**.

Genetic Fingerprinting. *See* **DNA Database**.

Genetics. *See* **T30(2)** and **T46–8**.

Genocide is an international crime, defined by the General Assembly of the United Nations in 1948 as "acts committed with intent to destroy, in whole or in part a national, ethnic, racial or religious group as such". The UN Convention came into force in 1951. Some recent conflicts (as in Rwanda) have seen acts of genocide, but the worst example is the Jewish Holocaust (*See* **J19**). The term is attributed to the Polish Jewish legal scholar, Raphael Lemkin, in 1943.

Genomes. *See* **T46–8**.

Genus, a term applied in biology to designate a group of similar species. A group of similar genera is called a family.

Geodesy, the science of calculating the configuration and extent of the earth's surface, and determining exact geographical positions and directions, with variations of gravity *etc.* Land-surveying is a branch of geodesy.

Geography, science concerned with the spatial organisation of natural features and life and man-made artifacts upon and immediately above the surface of the earth. It is increasingly concerned with the processes by which such patterns are generated.

Geology, the science which deals with the condition and structure of the earth, and the evidence afforded of ancient forms of life. The geological strata are classified in the following categories: *Primary* or *Palaeozoic* (the oldest fossil-bearing rocks including the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Permian); *Secondary* or *Mesozoic* (Triassic, Jurassic, Cretaceous); *Tertiary* or *Cainozoic* (Eocene, Oligocene, Miocene, Pliocene, Pleistocene); *Post tertiary* (recent rocks). *See* **Section V.**

Geometrical Progression, term used to indicate a succession of numbers which increase or decrease at an equal ratio—as 3, 9, 27; or 64, 16, 4.

Geometry is the branch of mathematics which demonstrates the properties of figures, and the distances of points of space from each other by means of deductions. It is a science of reason from fundamental axioms, and was perfected by Euclid about 300 B.C. The books of Euclid contain a full elucidation of the science. The ancient Babylonians used a complex form of geometry to track the movements of Jupiter.

Geophysics, the branches of physics which are concerned with the earth and its atmosphere. Meteorology, geomagnetism, aurora and airglow, ionosphere, solar activity, cosmic rays, glaciology, oceanography, seismology, rockets and satellites—all these are geophysical subjects.

Geothermal Energy. Some of the heavy elements within the earth's crust are radioactive and this gives rise to a temperature rise towards the centre of the earth. The practical exploitation of this geothermal energy comes about when there are hot springs or geysers. It is believed that these are caused by rainwater slowly percolating down to the hot rocks and blowing out as steam. The homes of people living in Reykjavik are heated by geothermal steam and there are a number of small power stations in various parts of the world. Although the costs in the few cases where geothermal power has actually been exploited are remarkably low, the expense of drilling, *etc.*, required when attempting to exploit the heat in the rocks where surface manifestations do not occur, is likely to limit the use of this source of power.

Geothermal Heating. The earth's interior is hot and in certain localities, often adjacent to volcanic or earthquake-prone regions, reservoirs of hot water or steam exist at accessible depths. Natural hot geysers occur in many such places and people, *e.g.*, the ancient Romans and present-day Japanese, use natural hot water for bathing, cooking and laundry. Occasionally the subterranean reserves permit large-scale power generation by drilling for hot steam and passing it into turbines to produce electricity. Pioneering work on this was done at Lardarello in Italy. Other sites are in New Zealand, California, Japan and Iceland.

Germanium. A grey, hard, brittle chemical element, no. 32, symbol Ge, chemically related to silicon and tin. Discovered by Winkler in 1886. Its richest ore is germanite containing 6% of the metal. Coal is also a relatively rich source. Since 1948 it has assumed great importance as a semi-conducting material for making transsistors (*q.v.*). Because of this it has been so intensively studied that more is known about its properties than any other element.

Gesta Romanorum (Latin = deeds of the Romans), a medieval collection of Latin stories of unknown authorship which circulated widely in Europe during the Middle Ages. First printed in the

15th cent. The stories were used by Chaucer, Shakespeare and others.

Gestation, the carrying of young in animals during pregnancy, varies considerably in its length. In the case of an elephant, the period is 21 months; a camel, 12 months; a cow, 9 months; a cat, 8 weeks; a horse, 48 weeks; a dog, 9 weeks; and a pig, 16 weeks. Hens "sit" for 21 days; geese, 30; swans, 42; turkeys, 28.

Geysers, hot springs of volcanic origination and action, are remarkable for the fact that they throw out huge streams of boiling water instead of lava as in the case of a volcano.

The most famous geysers are those of Iceland, which number over a hundred, the principal one having an opening of 21 m in diameter and discharging a column of water to a height of 61 m. There are many geysers in the Yellowstone Park (USA) and some in New Zealand.

The word geyser comes from a hot spring called Geysir in Iceland.

Ghetto, confined area of a town in which Jews or some other minority were once forced to live.

Ghost-Moth or **Ghost Swift,** an interesting nocturnal insect (*Hepialus humuli*) common in England, possessing in the male a white collar and known for its habit of hovering with a pendulum-like action in the twilight over a particular spot where the female is concealed.

Gibbon, the name of a long-armed ape mainly inhabiting S.E. Asia. It is without tail, and possesses the power of very rapid movement among the trees of the forests. They communicate with each other using organised sound patterns like early human language.

Gin, a popular spirit distilled from malt or barley and flavoured with the juniper berry. The main varieties are the English and American, known as "Gin" or "Dry Gin", and the Dutch, referred to as "jenever" or "Hollandse jenever". In Germany and Austria it is called "Schnapps". The word "Gin" is an abbreviation of "Geneva", both being primarily derived from the French *genièvre* (juniper). The 'gin craze' in Britain refers to the period around 1710–50.

Ginkgo. *See* **Maidenhair Tree**.

Giraffe, the tallest of existing animals, reaching a height of from 5–6 m when full grown. Its sloping back and elongated neck seem to be the natural evolution of an animal that has to feed on the branches of trees. It is a native of Africa, is of a light fawn colour marked with darker spots and has a prehensile tongue. Its remarkable eyesight can spot a predator two miles away. It needs only two hours' sleep. The latest DNA research has shown that giraffes are in fact four separate species.

Girl Guides. *See* **Boy Scouts**.

Glaciers form in higher mountain ranges, and are immense consolidated masses of snow, which are gradually impelled by their force down the mountain-sides until they reach a point where the temperature causes them to melt, and they run off in streams. From Alpine glaciers the five great rivers, the Rhine, the Po, the Rhône, the Inn and the Adige, have their source. The longest Swiss glacier is the Gross Aletsch, which sometimes extends over 16 km.

Some of the glaciers of the Himalayas are four times as long. The Muir in Alaska is of enormous magnitude, and that of Justeldals Brae in Norway is the largest in Europe. Recent high levels of glacial retreat no doubt reflect global warming but could have disastrous consequences for irrigation, hydroelectric schemes *etc.* They could dilute the Gulf Stream and greatly affect the climate of the UK. It is believed the Great Andean Glacier (and many in Tibet) will soon disappear. There is concern over the glaciers of Greenland and West Antarctica. The emission of soot in the Industrial Revolution melted some Alpine glaciers. Glaciers harbour highly active communities of bacteria, viruses and microscopic plants.

In 2008 glaciers half a mile thick and tens of miles long were discovered on Mars.

Gladiators were professional athletes and combatants in ancient Rome, contesting with each other or with wild beasts. At first they were drawn from the slave and prisoner classes exclusively, but so much were the successful gladiators held in esteem that men came to make a profession of athletics, and gladiatorial training schools were established. When a gladiator was vanquished without being killed in combat, it was left with the spectators to decide his fate, death being voted by holding the hands out with the thumb turned inward, and life by putting forth the hands with the thumb extended. Gladiatorial shows were the chief public displays in Rome from the 3rd to the 4th cent. A.D.

Glass is an amorphous, man-made substance, fluid when hot, solid, though fragile, when cooled. It is made of sand mixed with an alkaline flux, usually soda or potash. While hot, glass can be formed into almost any shape by moulding, blowing or, since the early 19th cent., by machine pressing. Unrefined glass normally has a greenish tinge, due to the iron content of most sands, but it is transparent or at least translucent. To make truly colourless glass is a difficult and expensive process, and such glass resembling the natural mineral, rock crystal, is given the name crystal. Glass can be tinted by the addition of various metallic oxides, cobalt producing blue, manganese mauve, *etc.* Because it is at once solid and transparent, glass is the perfect material for windows for which it has been used since Roman times. And since it can be made cheaply and is easy to clean, it has been used for containers in homes, shops and pharmacies, again since Roman days. Glass can also be made into things of beauty, by the use of coloured glass and by cutting, engraving, painting and gilding.

The earliest vessels of glass so far found come from Egypt and date back to *c.* 1500 B.C. With the invention of glass-blowing in the 1st cent. A.D., the use of glass spread throughout the Roman empire. Many varieties were made, including superb art glass like the Portland vase. The Arabs were great glassmakers after the 7th cent.

During the Renaissance the Venetians made luxurious art glass, rich in colour and often manipulated into fantastic forms. Bohemia's 17th-cent. glass is wonderfully engraved with pictures and cut into glittering facets.

During the 1670s in England George Ravenscroft invented a new, heavy, water-clear crystal, with an addition of lead as the magic ingredient, and English lead glass is still the basis for all modern crystals.

Glass-Snake, genus, *Ophisaurus*, of legless lizards with long fragile tails capable of re-generation when broken. Six species are known; in S.E. Europe, S.W. Asia, S.E. Asia and N. America. Attains a length of about 60 cm; main colouring, green, with black and yellow markings.

Glauconite. A green mineral, chemically a hydrated silicate of potassium and iron. Often found in marine sands (hence these rocks are known as "greensands") and sandstones.

Glaucus is a curious genus of sea slugs often called the Sea Lizard belonging to the molluscs. It has no shell and has a soft body, with horny mouth and four tentacles. It is a native of the Atlantic, and is not more than 30 cm long.

Glee, an unaccompanied piece for three or more voices. Glee-singing was popular in England during the 18th and early 19th centuries.

Globe Theatre. The original Globe Theatre was built on Bankside, London in 1599 and pulled down in 1644. Its foundations were excavated in 1989. Sam Wanamaker (1919–93), the actor, and Theo Crosby (1925–94), the architect had already conceived and designed a near-replica, which was built near the site of the Elizabethan theatre.

Globigerina, an oceanic unicellular animalcule with a perforated shell, and occurring in certain parts of the Atlantic in such vast numbers as to form a bed of chalk ooze with their empty shells.

Glow-worm, a beetle, possessing the power (much stronger in the female than the male) of emitting phosphorescent light from the hind end of the body. The brighter the light, the more males they attract. The female is wingless.

Glucinium. *See* **Beryllium.**

Glucose, Dextrose *or* **Grape Sugar** is a carbohydrate (*q.v.*). It is produced by hydrolysis from cane sugar, dextrine, starch, cellulose, *etc.*, by the action of reagents. It also occurs in many plants, fruits and honey. In brewing glucose is prepared by the conversion of starch by sulphuric acid. Malt also converts starch into glucose.

Glutton *or* **Wolverine,** the biggest animal of the weasel family, inhabits the northernmost parts of Europe and America. In build it resembles the bear, and is rather larger than a badger. Its fur is of a brown-black hue, but coarse.

Glycerine *or* **Glycerol,** occurs in natural fats combined with fatty acids, and is obtained by decomposing those substances with alkalis or by superheated steam. It is colourless and oily and sweet, and put to many uses, being widely utilised for medicaments, for lubricating purposes, and in the manufacture of nitro-glycerine.

Glycols. Organic compounds containing two alcohol groups. Ethylene glycol is the most widely known example; it is used as an anti-freeze in motor-car radiators on account of its property of greatly reducing the freezing point of water. Also used in the manufacture of "Terylene". *See* **Esters.**

Glyptodont, an extinct species of gigantic armadillo, fossil remains of which have been discovered in S. America. It was some 2·7 m long, carried a huge tortoise-like shell and had fluted teeth.

Gneiss, a metamorphic rock usually containing quartz, felspar and mica. It is banded, the light-coloured minerals being concentrated apart from the dark minerals.

Gnu or **Wildebeest,** a large antelope from Africa south of the Sahara, distinguished by its very short thick neck and large head with a pronounced roman nose. There are two species; the white-tailed gnu is almost extinct, the brindled gnu is still common and migrates in vast herds.

Goat-Moth (*Cossus cossus*), a large moth of the *Cossidae* family, common in Britain, evil-smelling and very destructive in the larval stage to trees of the poplar and willow genus, into the wood of which the caterpillar bores during its three years' period of development.

Goats are horned ruminant quadrupeds, indigenous to the Eastern Hemisphere, but now domesticated in all parts of the world. Though related to the sheep, they are a much hardier and more active animal. The male has a tuft of hair under the chin. Many species, including those of Cashmere and Angora, are valuable for their hair, which is used for fine fabrics.

Goat milk is nutritive, and goat-skins are in demand for leather for gloves, shoes, *etc.* Recent research has shown that the goat pre-dates any other animal as the first to be domesticated by humans. Goat is the world's most popular meat, eaten by 70 % of the world's population.

Gog and **Magog,** two legendary City of London giants who were brought captive to London and made to serve as prisoners at the Palace of Brute, which stood on the site of Guildhall. Effigies of the giants have stood in Guildhall since the time of Henry V. They were destroyed in the Great Fire of 1666, replaced in 1672 and used to be carried through the streets of London in the Lord Mayor's Show. The present figures replaced those carved in 1708 by Richard Saunders, which were destroyed in an air raid during the second world war. In the Bible, Ezekiel also makes reference to Gog and Magog.

Gold. Metallic element, no. 79, symbol Au (Latin *Aurum*) related to silver and copper, the coinage metals. The greatest amount of gold is obtained by treating gold-bearing quartz by the cyanide process. The gold is dissolved out by cyanide solution, which is then run into long boxes filled with zinc shavings when the gold is precipitated as a black slime. This is melted with an oxidising agent to remove the zinc. South Africa has traditionally been the world's largest gold producer, but has now been overtaken by China. India is the biggest market for gold jewellery. The price of gold rises on economic uncertainty (as in the 2011 sovereign debt crisis). Much gold is recycled. The oldest gold artefacts ever found date to around 4,500 B.C.

Gold-Beaters' Skin is the outside membrane of the large intestine of the ox, specially prepared and used by gold-beaters for placing between the leaves of gold while they beat them. Thin membrane is of great tenacity, and gets beaten to such extreme thinness that it is used to put on cuts and bruises.

Gold Standard. Under the gold-standard system which was widely prevalent up to 1941, each gold-standard country fixed the value of its currency in terms of a weight of gold of a certain fineness and was, broadly speaking, ready to exchange its currency freely for gold, which could then be exported without restriction.

This involved keeping a gold reserve big enough to meet all likely demands and also to serve as a backing for the issue of notes. The gold standard had to be given up during the first world war; and though it was in substance restored in Great Britain in 1925 (when Churchill was Chancellor), the restoration was never complete. Sterling had to be devalued in the crisis of 1931 and the UK was forced off the gold standard.

Golden Eagle. *See* **Eagle.**

Goldeneye, a species of wild duck, widely distributed over Arctic regions. It is a passage-migrant and a winter-visitor to the UK. Distinguished by a large white spot in front of each eye on a dark ground.

Golden Number, the number of any year in the metonic cycle of 19 years, deriving its name from the fact that in the old calendars it was always printed in gold. It is found by adding 1 to the number of the year A.D. and dividing by 19, the remainder being the Golden Number; or, if no remainder, the Golden Number is 19.

Goldfish, or *Carassius auratus* were introduced to Britain in the 18th century. Numbering 125 breeds, their sense of smell is even better than a bloodhound. First recorded in China, A.D. 400.

Goldsmiths Company, one of the richest London City Companies; the official assayers of gold and silver, invested with the power of "hallmarking" the quality of objects made from these metals. First charter granted in 1327.

Gondola, the old regulation black boats so common on the canals of Venice, propelled by a gondolier with one oar who stands at the stern.

Gondwana, the name of the ancient southern land mass linking Antarctica, Australia, India *etc.*

Gonfalon, the pennon affixed to a lance, spear or standard, consisting usually of two or three streamers and made to turn like a weather-cock.

Gonzo Journalism, a highly subjective and personal style of writing in which the writer is an essential part of the story. The leading exponent was Hunter S. Thompson.

Gophers. Rodent mammals. The pocket gophers are stout-bodied burrowers common in the USA. The slender burrowing gophers, also called "ground squirrels", occur in central and western USA. The sisel or suslik is a related European species. They are a great pest.

Gorilla, the largest of the anthropoid apes, found in the forests of Equatorial Africa, and at maturity standing from 1·2–1·5 m high. Eastern mountain gorillas are one of the most endangered species in the world. They are our largest living primates on Earth. Now less than 700 survive in the Congo, Rwanda and Uganda. The Western Lowland gorilla (the world's most common gorilla) is now on the endangered list, also threatened by habitat loss and hunting.

Goshawk (*Accipter gentilis*), a diurnal bird of prey, fearless and extremely agile; loves wooded country and is very destructive of poultry and game-birds. It resembles the peregrine falcon in appearance, but has shorter, rounded wings. This bird was a great favourite of falconers in medieval times. A few have now been reintroduced from Scandinavia but are believed to be causing decline to the kestrel.

Goths. A Teutonic people who originally came from southern Sweden (Gotland) and by the 3rd cent. were settled in the region north of the Black Sea. They began to encroach on the Roman Empire and early in the 4th cent. split into two divisions: the "wise" Goths or Visigoths between the Danube and the Dniester (referred to as the West Goths), and the "bright" Goths or Ostrogoths in southern Russia on the Dnieper (known as East Goths).

The Ostrogoths were later conquered by the Huns *c.* 370, while the Visigoths under Alaric devastated Greece and sacked Rome in 410. Eventually the Visigoths spread to France and Spain and their last king Roderick fell in battle against the Moors in 711. The Ostrogoths regained their independence on the death of Attila in 453 and under king Theodoric the Great conquered Italy in 493. They lost their identity after Justinian regained Italy, 525–552.

Gourd Family *or* **Cucurbitaceae.** This family of about 650 species of flowering plants includes the gourds, pumpkins, cantaloupes, cucumber, gherkin, water-melon and squashes. Most abundant in the tropics, the cucurbits are mainly climbing annuals with very rapid growth. The bathroom loofah is the skeleton of one cucurbit fruit, *Luffa cylindrica*. The squirting cucumber is another member of the family.

Governor. A device attached to an engine, turbine, compressor, *etc.*, which automatically controls the engine's speed in accordance with power demand. Most governors depend upon the centrifugal action of two or more balls which are thrown outwards as their speed of rotation increases and actuate a throttle valve or cut-off. The centrifugal governor was invented by Thomas Mead, patented by him in 1787. Watt adapted it to the steam engine.

Grail, Legend of the Holy, a tale of Celtic origin which became part of Arthurian legend. According to the Christian version the grail was the cup which Christ used at the Last Supper, brought to England by St. Joseph of Arimathea. Its link to Glastonbury Abbey was invented by medieval monks.

Grand Prix, the "French Derby" was established by Napoleon III, in 1863. It is the chief French race and is for three-year-olds. The term is now also widely used in motor racing.

Granite is a coarsely crystalline igneous rock consisting of quartz and alkali felspars plus mica or hornblende. It is a much used ornamental and building stone; it forms the high ground of Dartmoor and Bodmin Moor.

Graphene, the thinnest material in the world (200,000 times thinner than the line down the centre of this page). Almost completely transparent. It has exceptional electrical qualities and is likely to transform medicine, technology and computing.

Graphite *or* **Plumbago,** commonly called black-lead, is a form of carbon occurring in foliated masses in marble, schist, *etc*. It is soft, will make black marks on paper or other plain surfaces, and is mainly used for lead pencils. It is also a valuable lubricant. Pure graphite has found a use with the construction of atomic piles. China, India and Canada are the main producers.

Graphology, the science which interprets and analyses the way letters are formed and shaped.

Graptolites, fossil animals confined to Cambrian, Ordovician and Silurian strata.

Grasshopper. There are eleven species of these leaping insects which are related to the locusts and crickets. Most are vegetarians; some eat flies and caterpillars also. The chirping sound they make is made by scraping the hind legs against the wings; in some species a noise is produced by rubbing the wings together.

Gravitation. One of the four types of force known to physics. The others are electromagnetic, the weak nuclear and the strong nuclear forces. Gravitational forces are an attraction that one piece of matter has for another; they dominate astronomical phenomena, but inside the atom they are negligible compared with the other types of force. Einstein's General Theory of Relativity is the only theory which attempts to interpret gravitational forces in terms of more fundamental concepts. Scientists have now proved that gravity does indeed travel at the speed of light. They have also detected ripples of gravity from black holes.

Graylag, the ordinary wild grey goose of Europe, the species from which domestic geese are derived; frequents fens and marshes; breeds in Iceland, Scandinavia and Scotland; it has pinkish legs and feet and lack of black markings on bill.

Great Auk. *See under* **Auks.**

Great Wall of China, enormous system of walls (1,500 miles in length) built to protect China's northern frontier. Completed 204 B.C. It is the longest man-made structure on Earth. The best preserved sections are near Beijing but erosion, tourism *etc.* are causing much damage.

Grebe, a diving bird of beautiful plumage found over a great part of the world on lakes and oceans. The two species familiar in Great Britain are the Dabchick or Little Grebe and the large and handsome Great Crested Grebe, which has a feathery tuft, lost in the autumn, on each side of the head. Grebes have remarkable courtship displays. The breast feathers are of a downy softness and silver lustre.

Greek Fire, a combustible supposed to have been composed of sulphur, nitre, naphtha and asphalt, used with destructive effect by the Greeks of the Byzantine Empire in their wars.

Greek Mysteries. *See* **Mysteries, Greek.**

Green Plover. *See* **Lapwing.**

Greenwich Mean Time. The first Nautical Almanac, for the use of navigators and astronomers, was published by the Astronomer Royal in 1767. It was based on the meridian at Greenwich, with longitude measured east and west of 0°. A master clock, which still exists, was built at Greenwich Observatory in 1852 to control the railway station clocks and Greenwich Mean Time, or Railway Time as it was sometimes called, prevailed. In 1884 Greenwich was chosen as the prime meridian of the world and GMT became known as Universal Time. The time-keeping role is now done by the International Bureau of Weights and Measures. GMT has become UCT (Universal Coordinated Time). Recently, the Daylight Extra Now group has campaigned to abolish GMT and have an extra hour of daylight in the evening. There is now a movement to replace GMT in favour of a time defined by a linked collection of 400 atomic clocks. *See also* **British Standard Time** and **T59**.

Gregorian Calendar. *See* **Calendar**.

Gresham's Law states that if money, *i.e.*, money with the higher intrinsic value, and bad money are in circulation together, the bad money will tend to drive out the good money from circulation. For instance, the good money is more likely to be melted down or demanded in payment by foreign creditors.

Gretna Green, a celebrated village in Annandale and Eskdale, just over the border from England, where runaway marriages were performed from 1754 to 1856 (now a romantic wedding venue).

Griffin, in ancient mythology, a winged creature with an eagle's head and the body of a lion, found in ancient sculptures of Persia and Assyria. Its origin is traced to the Hittites.

Grilse, a salmon that has only been once to the sea.

Grimm's Law, formulated by Jacob Grimm, an eminent German philologist, lays down a principle of consonantal change in the Germanic languages. Thus, Lat. *pater,* Eng. *father,* Ger. *Vater;* Lat. *frater*, Eng. *brother*, Ger. *Bruder*.

Grogram (French = *gros grain*), a kind of rough fabric made of wool and some other fibre, such as silk, mohair or cotton.

Grotto, a natural or artificial cave. Among the most famous are the blue grotto of Capri and the grotto of Antiparos (Cyclades, Aegean).

Ground Wave, that part of the energy emitted by a radio transmitter which travels along the ground; as opposed to the sky wave which is reflected back to earth by the ionosphere.

With the lower radio-frequencies, the ground wave can be picked up over several thousand miles; in the broadcasting band, over a hundred or.so miles; it is almost useless at high frequencies.

Groundnut. *See* **Peanut.**

Grouse, game bird of the northern latitudes where some 20 species occur. They are stout, compact, ground-dwelling birds, protectively plumaged (the willow grouse turns white in winter), the male usually being larger and more brightly coloured than the female. The red grouse of the British moorlands has been introduced into Belgium and Germany. Of the same family are the blackcock, ptarmigan, capercaillie, American prairie-hen and the partridge. The black grouse in Britain is in rapid decline.

Guanaco, a large species of llama, common to South America. Utilised as a beast of burden.

Guano, the excrement of sea-birds, found in large quantities on the rocky islands of the western coasts of South America and the Nauru Islands. It forms a useful fertilising agent, being rich in phosphate and ammonia, and first came into use in 1841, since which time Peruvian guano has been a recognised article of commerce.

Beds of guano from 15–18 m in thickness are not uncommon. Fish guano and bat guano from caves in South America and the Bahamas are also used as fertilisers.

Gudgeon, a small fresh-water fish of the carp family with 2 small barbels on the upper lip. A recent immigrant, *topmouth gudgeon,* poses a major threat.

Guildhall, the place of assembly of the members of a guild, and at one time, when guilds were in full strength, was practically the Town Hall. The London Guildhall is today the hall of meeting for the City of London Corporation.

Guilds for the fostering and protection of various trades have existed in England since Anglo-Saxon times and from the 12th to the 16th cent.

exercised great influence and enjoyed many privileges. There were trades' guilds and craftsmen's guilds, and in all large cities and towns there was a guild hall.

Their successes led to many monopolistic abuses, and in the end it became necessary to free the country from their restrictive power.

The City Guilds (Livery Companies of the City of London) derive their name from the 14th cent. dress assumed by their members.

Guillemot, a genus of sea-birds of the auk family, common in Northern Europe, two species—the Common Guillemot and the Black Guillemot—being natives of our own sea coasts, nesting on the cliffs. Brünnich's Guillemot, an Arctic species, is a rare straggler in Britain. When food is scarce, guillemots will kill the unattended chicks of other pairs.

Guillotine, the method of execution during the French Revolution. Devised by Joseph Guillotin (1738–1814). Last used in France in 1977. It was actually designed to make death as quick and painless as possible!

Guinea, an English gold coin of the value of twenty-one shillings, current from 1663 1817, and deriving its name from the first guinea coinage having been struck from gold obtained on the coast of Guinea.

Guinea-Pig, a rodent of the cavy family about 25 cm in length and with a tail so short that it does not project outside the body. It makes an excellent pet, though easily frightened. Its ancestors were species of the wild cavy of S. America domesticated by the Incas of Peru.

Gules, a heraldic term, denoting a rose of red tincture, indicated by vertical lines drawn or engraved without colour.

Gulf Stream is confined entirely to the western side of the N. Atlantic and is the warm-water current flowing through the Straits of Florida from the Gulf of Mexico parallel to the American coast up as far as Cape Hatteras. From there it continues north-eastwards as a slower, broader, cooler (yet even so, relatively warm) drift of water, merging with the North Atlantic Drift and losing its identity about 40° N. Lat., 60° W. Long. It is a common error to attribute the warmth of the British Isles and Western Europe generally to the Gulf Stream but this has no influence whatever except in so far as it feeds the North Atlantic Drift. The Gulf Stream and North Atlantic Drift owe their movement to the direction of the prevailing winds.

It is the south-westerly airstream coming from warmer regions and passing over the waters of the Atlantic Drift that brings the warmth inland to influence the climate of Western Europe.

Gull. An extremely well-known, long-winged seabird with rather short legs and webbed feet. In almost all adults the body and tail are white whilst the back and most of the wings are grey or black. In the majority of cases the plumage of juveniles is partly or entirely dusky. Gulls are omnivorous, and are very useful as scavengers. They follow ships and quickly seize on any refuse which may be thrown overboard.

There are 44 species, which vary in size from moderately small to large. With certain exceptions, such as the Kittiwake in the North Atlantic, they are normally not found very far from land.

They are sociable and mostly breed in colonies on cliff-ledges, on islands, beaches and sandhills and.among vegetation in swamps, sometimes a long.way from the sea. The nest is usually substantial, and the eggs generally number from two to three. Of the 29 species breeding in the northern hemisphere, 14 occur in the British Isles. The pure white Ivory Gull is the most northerly of birds. Sabine's and the Swallow-tailed Gull have forked tails. Ross's Gull has a black ring round the neck and one species, Franklin's Gull, migrates from the North, where it breeds, to pass the winter in the Southern hemisphere. The breeding population of herring gulls in the UK is now reported to be falling sharply. The population of urban gulls in Britain is rising very fast. Gulls and their nests are protected under the 1981 Wildlife and Countryside Act.

Gums are glutinous compounds obtained from vegetable sources, soluble in cold or hot water, but not in alcohol. There are innumerable varieties. Gum Arabic is exuded from a species of acacia grown in Senegal, the Sudan, Arabia, India *etc*., and is a valuable commercial product, used in dyeing, ink-making, as a mucilage, and in medicine. Indiarubber is an elastic gum. Gums are also made from starch, potatoes, *etc*. Chewing gum products were first made in the 1860s.

Gun-Cotton, a powerful explosive manufactured by subjecting a prepared cotton to the prolonged action of a mixture of three parts sulphuric acid and one part of nitric acid. It burns without explosion on ignition, but by percussion explodes with a force five times greater than gunpowder does.

Gunpowder, also called "black powder", the oldest of explosive mixtures, consists of saltpetre, sulphur and charcoal, intimately mixed.

Gurkhas, famous regiment of the British Army, first formed by Nepalese fighters in 1815. The Gurkhas have been awarded 13 VCs. Their legal right to stay in Britain was won in 2009.

Gurnard, a sea-fish, with large, bony head and diminutive body, of which there are some forty species. They are plentiful in British waters. Often used for soups and stock.

Gymnasium, originally the name given in ancient Greece to the public places where Greek youth used to exercise and receive instruction. Plato, Aristotle and other great teachers lectured there. The Greek institution was never very popular with the Romans, and it was not until the 18th and 19th cent. that the cult of combining physical with intellectual activity revived. In Germany the name was applied to the classical grammar school.

Gypsies, a race of Indian origin; their language, Romany, is related to the languages of N.W. India. The Roma are nowadays spread over many parts of the world, but are most common in Europe where they appeared at the end of the Middle Ages.

The English name *gypsy* comes from the Byzantine Greek for Egyptian; other European names are *Zigeuner* (Ger.), *zingaro* (It.), *fzigany* (Magyar), all resembling the Persian *singar* = a saddler. Their history has been one of persecution. Hitler treated them like the Jews.

In Britain after 1945 they were kept increasingly on the move, but in 1968 Parliament passed a Bill to make the provision of sites a duty of local authorities. However, the 1994 Criminal Justice and Public Order Act made it much easier to move on unwelcome gypsies. Economic pressure has largely removed their traditional crafts of tinkering, basket-making and peg-making. The majority now deal in scrap-iron. Today there are around 12½ million European Gypsies and in some parts (such as Hungary, Bulgaria, Romania, the Czech Republic and Slovakia) they are again subject to ill-treatment or discrimination.

The Romani language is not yet recognised as a minority language in the UK.

Gypsum, a whitish mineral consisting of hydrated sulphate of calcium. The finest gypsum is alabaster. When heated gypsum is converted into the powder called Plaster of Paris; the water it loses can be taken up when the plaster is wetted, and the reconversion of Plaster of Paris into gypsum accounts for the way in which the former sets hard. The name "Plaster of Paris" came from the location of important gypsum quarries in the Montmartre district of Paris. It was found after the flood disasters of January 1953 that gypsum could undo the effect of sea-water. By spreading it for the rain to wash into the soil, thousands of acres of farmland in Holland and Britain were made productive again.

Gyroscope is a symmetrical rapidly rotating object, typically wheel-like, which because of its mass and rotation possesses a lot of the dynamical property known as angular momentum. Basic dynamical laws tell us that angular momentum is conserved and a consequence of this is that the axis of rotation tends to stay pointing in the same direction. Disturbing influences make a gyroscope's motion complicated but the general effect of the presence of a gyroscope attached to any body is to help to stabilise the body's motion. This is made use of in reducing the rocking of ships and in compasses and control systems in aircraft, torpedoes *etc*.

H

Habeas Corpus, the name given to a writ ordering the body of a person under restraint or imprisonment to be brought into court for full inquiry into the legality of the restraint to be made.

The first Habeas Corpus Act was passed in 1679, though nominally such a right had existed from Magna Carta, but some of the more despotic kings had disregarded it. In times of public peril the privilege of *habeas corpus* is sometimes temporarily suspended.

Haber–Ostveldt Process, the important industrial process for synthesising ammonia from atmospheric nitrogen. Nitrogen and hydrogen are combined at high pressure (*c.* 350 atmospheres) and moderately high temperature (500°C) using a catalyst (made largely of iron). A yield of 30% is obtained. The majority of the world's ammonia is produced in this way or from methods derived from it.

Haddock, one of the best-known fishes abounding in northern seas and averaging about 1·8 kg in weight. Related to the cod. Largely used for curing, and sold as "finnan haddies". Its spawning grounds are off Norway, Iceland and the Faroe Islands.

Hade of veins, a mining term indicating the particular inclination that any vein, seam or strata may have from the perpendicular; thus, in Weardale the veins mainly "hade" to the north.

Hadrian's Wall. *See* **Roman Walls.**

Haematite, ferric oxide, one of the principal iron ores, containing about 70% of the metal. It is usually found in kidney-shaped masses, and is specular, red or brown, in thin fragments but greyish in bulk.

Haemocyanin, the respiratory pigment of crustaceans and molluscs. It functions like haemoglobin, from which it differs in containing copper instead of iron and being blue when oxidised instead of red.

Haemoglobin, the pigment containing iron which gives red blood corpuscles their colour. It is a respiratory pigment, having the property of picking up oxygen when the blood passes through the lungs to produce the compound known as oxyhaemoglobin. In other parts of the body the oxyhaemoglobin breaks down, liberating oxygen, which is used in the oxidation process (respiration) that the body tissues carry on.

Hafiz, a title conferred upon any Muslim who has committed the whole of the Koran to memory.

Hafnium, a metallic element, no. 72, symbol Hf, discovered by Coster and Hevesy in 1922 and important in the atomic-energy field. It occurs in most zirconium minerals to the extent of *c.* 5%. It may replace silicon in new computer chips.

Hagiology, a branch of literature that is wholly given up to the history of the saints, and the setting out of their stories and legends.

Hail, hard, roughly spherical balls of ice, consisting of white cores covered by layers of both transparent and opaque ice, frequently falling during thunderstorms. They usually do not exceed 2·5 cm in size, but hailstones as large as tennis balls have been observed. The general theory of a hailstone is that near the top of a cumulonimbus cloud a raindrop becomes frozen, grows in size by condensation and through collisions with snow particles, and eventually becomes so weighty as to overcome the ascending air currents in the cloud. Falling, it first encounters supercooled water drops, immediately freezing on it, increasing the white core, and then at lower levels ordinary water drops, freezing more slowly, making a layer of clear ice.

Before the hailstone arrives at the ground gusts and lulls may transport it several times up and down both regions, adding alternate coatings of soft white and hard clear ice.

Halcyon, a term associated in olden times with the kingfisher and days of soothing calm, "halcyon days" being a frequently used expression. The legend was that the kingfisher laid its eggs on the surface of the sea at the time of the winter solstice when the sea was unruffled. (Halcyon is the Greek for kingfisher.)

Halibut, one of the largest of the flat fishes, averaging when full grown from 1·2–1·8 m in length, and highly esteemed for the table. Specimens of still larger size occasionally occur. It is plentifully distributed. Its two eyes are on the right side of the head.

Hallmark. A mark or group of marks, impressed by an assay office on gold or silver articles (and on platinum since 1974) guaranteeing the standard of fineness of the precious metal used in them. These marks, which have been applied to silver made in London since the beginning of the 14th cent. and perhaps earlier, make it possible to establish the year and place of assay and also the name of the maker. English pieces of silver usually have not less than four marks, viz., (1) town mark; (2) maker's mark; (3) date letter; (4) sterling mark.

The town mark is rarely changed; in London a crowned leopard's head was used from the earliest days until 1820 with only minor modifications, except for the period 1697–1720 when a lion's head erased was substituted; since 1820 the crown has been omitted.

Until the late 17th cent. a symbol was often used as a maker's mark, from 1696–1720 the first two letters of the maker's surname, and subsequently the maker's initials. Owing to the destruction of the earlier mark plates at Goldsmiths' Hall no maker's name prior to the late 17th cent. can be identified with certainty.

The London date letter is changed at the end of May each year, so each letter covers seven months of one year and five months of the following. The London date cycle has usually consisted of twenty letters: the alphabet of each cycle is of different style, and the letters are enclosed in shields of different shape.

The sterling mark, the lion passant, was introduced in 1544 and continued in use until 1697, when the higher Britannia standard was introduced in order to discourage the practice current amongst goldsmiths of melting down coin of the realm to make plate. The leopard's head crowned and the lion passant were then replaced by a figure of Britannia and a lion's head erased. Though the regulation imposing a higher standard was withdrawn in 1720, a small amount of Britannia standard silver continued to be made and still is made.

From 1784 until 1890 a plate tax was levied on all silver assayed in Great Britain and an additional duty mark, the sovereign's head, was used during this period. A Jubilee mark bearing the head of George V and of Queen Mary was used between the years 1933 and 1935, and in 1953 a coronation mark with the head of Queen Elizabeth was introduced. A special Millennium hallmark was available in 1999 and 2000.

Under the Hallmarking Act 1973 the hallmarking of platinum is now compulsory; the hallmark symbol is an orb surmounted by a cross and encompassed by a pentagon. There are now assay offices in London, Birmingham, Sheffield and Edinburgh.

Halloween (31 October), the eve of All Saints' Day, a time associated, especially in Scotland, with certain old traditions. It is the night when young men and women are supposed, by observing certain rites, to have their future wives and husbands disclosed to them. In old Gaelic culture it celebrated the end of the harvest season.

Halo, a luminous circle usually of 22° radius, surrounding sun or moon, produced by the refraction and reflection of light by ice crystals of high cirrus cloud. It is a very common occurrence, in the British Isles almost one day in three. The inner side is red and the outer a whitish-yellow colour.

"Mock suns", *i.e.*, patches of light at the same elevation as the sun are much rarer occurrences, sometimes being of great beauty and brilliance. Halo is the Greek for threshing-floor. *See* **Corona.**

Halogens, the group name for the five nonmetallic elements fluorine, chlorine, bromine, iodine and astatine. The term "halogen" means "salt-producer".

Halteres, the modified hind-wings of the two-winged flies or *Diptera* (*e.g.*, the house-fly). The equilibrium in flight of these insects depends on the halteres, commonly called "balancers".

Hand, a measure of 4 in (10 cm), the average size of the palm; used in reckoning height of horses.

Handfasting, an informal marriage custom once prevalent in Scotland, whereby a man and woman bound themselves to cohabit for a year and a day, and at the end of that period either confirmed their contract by a regular marriage or separated.

Hansard, the title given to the official reports of Parliamentary debates, so named after Luke Hansard who in 1774 became partner in a firm of printers to the House of Commons. His son T. C. Hansard was first the printer and then the publisher of an unofficial series of parliamentary debates inaugurated by William Cobbett in 1803. In 1909 production was taken over by H.M. Stationery Office and today's volumes contain full, substantially verbatim, reports of what is said in both Houses of Parliament.

Hara-kiri, the custom of suicide, as formerly practised in Japan, when in disgrace.

Hare, a rabbit-like animal with longer ears and legs. There are many kinds of hare distributed over the northern hemisphere and in Africa south to the Cape. They do not burrow as do rabbits but rely on camouflage, speed and mobility for safety. Hares box females to show off their strength. Sightings of hares across Britain have declined sharply in the last 50 years. Hare-coursing was banned in 2005. *See* **Game.**

Harleian MSS. comprise some thousands of volumes of MSS. and documents, collected by the first Earl of Oxford (1661–1724) and his son Edward. After the death of the latter, his widow handed the MSS. over to the nation for £10,000, and they are now in the British Museum.

Harlequin, the buffoon of ancient Italian comedy. As adapted to the British stage, however, harlequin is a pantomime character only, in love with Columbine, appearing in parti-coloured garments and carrying a wand, by which he exercises a magic influence in thwarting the fantastic tricks of the clown and pantaloon.

Harmattan, a dry wind which may blow between January and May across the Sahara to the Gulf of Guinea. Although affording relief from the tropical heat, vegetation withers because of its extreme dryness and much irritation is caused by the clouds of fine dust which it carries.

Harmonic Motion, regular periodic motion of the kind exemplified by a ball bobbing up and down at the end of a spring, and by the piston in a steam engine. It may be simple (simple harmonic motion) or composed of two or more simple harmonic motions. In simple harmonic motion the acceleration is proportional to the distance of the moving body from its original rest position.

Harp-seal, the ordinary Greenland seal, with a dark harp-shaped marking on its back, hence its name. It abounds in Newfoundland waters and further northward towards the Arctic.

Harpy Eagle, a large bird of prey named from the winged monsters of Greek mythology, inhabiting the forest regions of Central and South America. There are eight species, one with handsome grey plumage and large crest which attacks and kills animals much larger than itself, and was called by the Aztecs "winged wolf ".

Harrier, a bird of prey of the falcon family; of the various species distributed over the world, three breed in Britain: the moorland Hen harrier, the Marsh harrier and Montagu's harrier. They are large birds with long tails, long legs, long wings and gliding flight. They nest on the ground and eat small mammals, frogs, lizards and small birds. Breeding pairs of hen harriers are being introduced to areas of the UK where they are now extinct.

Hartebeest, common African antelope of a grey-brown colour, with ringed and knotted horns bending backward and tapering to sharp points: gregarious, of large size. There are several species.

Harvest Bug, a very small insect, of a dark red colour, which appears in large numbers in the fields in autumn, and is peculiarly irritating to animals and man by the tenacity with which it attaches itself to the skin and burrows underneath. Probably the larvae of spinning mites (Trombidoids). In the USA they are called "chiggers".

Harvest Moon, the full moon that occurs nearest to the autumn equinox, in September. It rises for several nights running about the same time, and yields an unusually brilliant series of moonlight nights.

Harvestmen are, like spiders, members of the arachnid class but belong to the distinctly different order of Phalangida. They are common in the countryside in autumn and have small oval bodies and eight long slender legs which besides being mere organs of locomotion also act as sense organs. Known as "daddy longlegs" in America and Britain.

Hashish, an Arabic word for the narcotic substance prepared from the hemp plant (*Cannabis sativa*). It is known by a variety of names, *e.g.*, bhang in India and marijuana in America.

Hatchment, in heraldry, is a square board, in vertical diagonal position, placed outside a house or on the tomb at the death of a member of a family and so arranged that it indicates the sex and condition of the deceased.

Hawaiian Goose. *See* **Néné.**

Hawfinch, a well-known European bird of the finch family, having a variegated plumage, a sturdy bill and black-and-white tail. In England it is found in the Midland and Eastern counties, and locally in Scotland. Its numbers are now in sharp decline.

Hawk. This name is applied to almost any diurnal bird of prey other than eagle, falcon or vulture, but in its strict sense applies only to the *Accipiter* genus—the small Sparrow Hawk and the larger Goshawk, round-winged, long-tailed birds with barred under-parts. They prey upon small birds captured in flight and small mammals.

Hawkbit. A small bright yellow dandelion.

Hawk-moths, a large species of moths, thick of body and strong of wing, which fly with rapid swooping motion, hence the name. There are numerous handsome species in Britain.

Heat, It was established in the 19th century that heat is a form of energy; it is in fact the combined kinetic and potential energy of the atoms of which a body is composed. Heat can be turned into other forms of energy, *e.g.*, a red hot body loses heat by radiating it in the form of electromagnetic waves ("radiant heat"—chiefly infra-red rays). Heat may also be transferred from one place to another by conduction and, in fluids, by convection. All three processes occur as a glowing fire heats a room.

A unit quantity of heat is the calorie, which is the amount of heat sufficient to raise the temperature of 1 g of water by 1°C. In general, adding heat to a body raises its temperature. The number of calories required per gram of material to raise the temperature 1°C is called the *specific heat* of the material. However, adding heat may not raise the temperature but may instead cause a change of state, *e.g.*, from solid to liquid (melting) or liquid to gas (evaporation). The amount of heat required to melt 1 gram of a solid is called the latent heat of melting. Similarly, there is a latent heat of evaporation. Strictly speaking, the specific and latent heats of a substance depend on how much its pressure and volume are allowed to vary during the measurements. Water has a high specific heat, and this makes the oceans a vast heat reservoir, a factor of great meteorological significance. The science of heat is called thermodynamics.

Heat Pump, essentially a refrigerator working in reverse, *i.e.*, a device which warms up one place, say, a house by releasing into it heat transferred from another place, say, the air or earth outside the house. The idea is attributed to Lord Kelvin (1852) and later Haldane used a heat pump to heat his house in Scotland. In Summer, a house could be cooled by operating the device in reverse. As in a domestic refrigerator, the heat is transferred by a suitable fluid whose circulation has to be driven by an external supply of energy, *e.g.*, by running a mechanical compressor. With good design and favourable conditions, the energy required to run the heat pump is considerably less than would be required to produce the same warming effect directly.

Heath, flowering plants of the *Ericaceae* family. Heaths are widely distributed over uncultivated spaces of Europe and Africa. In Britain they are represented by heather (of which there are several species) and ling (*Calluna vulgaris*), which cover thousands of acres of moorland.

Some of the African or Cape heaths are very beautiful and much prized by florists. One species of heath (*Erica arborea*) which grows in S. Europe and N. Africa has close-grained woody rootstock used for making briar pipes.

In N. Europe acid heathlands, dominated by heather and ling, form one of the most widespread vegetation areas created by man through the widespread destruction of forests, grazing *etc.*

Heathrow Airport, originally called London Airport (Heathrow) and named after a village where Terminal 3 now stands. It opened on 1 January 1946. The airport handles more than 82 airlines from 85 countries and offers direct flights to more than 180 destinations. In 2010 Beijing international airport overtook Heathrow as the second busiest in the world.

Terminal 5 was finally given approval in 2001. It opened in March 2008 after a £4·3 billion development (the biggest in UK airport history).

A new terminal, dubbed Heathrow East replaces Terminals 1 and 2. Estimates suggest Heathrow handled over 75 million passenger in 2016. Plans for a third runway were approved in January 2009 despite much opposition.

Future airport capacity in the London area was the subject of an inquiry under Sir Howard Davies. It made controversial recommendations to expand Heathrow, which the Government now supports.

Hedgehog. This much-loved nocturnal little creature, with its prickly spines, is fast disappearing in Britain. Since 2003 it has fallen by over 30% to under a million. In the 1950s, there were over 35 million. There are calls for the hedgehog to be our national animal.

Hegira, an Arab term signifying departure or flight, used in reference to Mohammed's departure from Mecca, A.D. 622, from which date the Muslim era is reckoned.

Helicopter, heavier-than-air aircraft which obtains its lift from blades rotating above the fuselage in windmill-fashion. The first successful helicopters were the Focke-Wulf 61, a German machine (1936), and the VS-300, designed by Igor Sikorsky, flown in 1937. Helicopters can hover, and rise and descend vertically, in addition to being capable of horizontal flight.

Heliosphere, the huge region surrounding the Sun that is permeated by the solar wind. The heliosphere is bounded by the *heliopause*, its outer limit, four times further away than Pluto.

Heliotrope, a favourite sweet-scented flowering plant, common in tropical and sub-tropical countries; the Peruvian heliotrope is the "cherry pie" of our summer garden borders.

Helium, a gaseous element, no. 2, symbol He, first discovered by means of the spectroscope in the sun's atmosphere. This discovery, made in 1868 by the astronomer Sir Norman Lockyer, was followed in 1895 by Sir William Ramsay's proof that the element existed on earth. He found it in the uranium ore, clevite. Later it was established that helium is formed by the radioactive decay of many elements which emit α-particles (nuclei of helium atoms) and is contained in all radioactive minerals. The largest source of helium is natural gas, the richest in helium being the gas from certain wells in Utah, USA. Next to hydrogen, helium is the lightest gas known, has a lifting power equal to 92% of hydrogen and the advantage that it is inert and non-inflammable. It is used for inflating airships. Ordinary air contains 1 part in 200,000 of helium. It was the last gaseous element to be liquefied, this being achieved by Onnes in 1908 in Leyden. Helium accounts for about 24% of the mass of the universe.

Liquid helium has remarkable properties not fully understood. It is indispensable in cryogenics (*q.v.*) as a medium for cooling other substances to temperatures near absolute zero. Hydrogen fusion in the "H bomb" produces helium. Helium-3, is a lighter version used in MRI scanners. It could be used for nuclear fusion.

A vast new reserve of helium was found in 2016 beneath the Great Rift Valley in Tanzania.

Hellebore, a plant of the *Ranunculaceae* (buttercup) family. The best-known British examples are the green and stinking varieties. There is also a garden kind which flowers in December called the Christmas Rose. Hellebore yields a bitter substance once much used as a purgative.

Hemiptera, the order of insects to which belong the true bugs. Their wing structure is in most species incomplete, hence the term hemiptera (half-wing). This order includes the familiar water insects, the water boatman and water skater, also the aphids, cicadas, leaf hoppers, scale insects.

Hemlock, a tall, green plant of the *Umbelliferae* family, growing in all parts of Britain, and containing a strong alkaloid poison. Used medicinally, this alkaline substance is of considerable service, being a powerful sedative. According to Pliny, hemlock was the poison used by the Athenians in putting criminals to death. Socrates met his fate this way in 399 B.C..

Hemp (*Cannabis sativa*), name of a plant native to Asia, now cultivated widely for the valuable fibre contained in the stalk or in some species in the leaves. Hemp fibre has been replaced by cotton for textiles and by jute for sacks and is now chiefly used for cordage and twine. It contains a resinous substance from which the narcotic hashish is made. The seed yields a valuable oil. The term hemp is also used for other fibre plants, *e.g.* manila hemp from the Philippines, sunn hemp from India, sisal from W. and E. Africa and phormium from New Zealand.

Henbane, a plant found in Britain and other parts of Europe and Northern Asia. It belongs to the potato family *Solanaceae*, grows mostly on waste ground and bears yellow-brown flowers veined with purple. The leaves yield a poisonous alkaloid substance which is of great use in medicine. Tincture of henbane is often preferred to laudanum.

Hepatics. *See* **Liverworts.**

Heracleum, a plant of the *Umbelliferae* family, common in southern and central Europe, though only one species, the cow parsnip, grows in England. It has a bitter root, and the juice of the stem yields an intoxicating liquor.

Herald, an officer of state empowered to make formal proclamations and deliver messages from the sovereign or other high personage whom he serves. In the developments which took place in armorial bearings, the herald was charged with the duty of their proper depiction.

Heraldry, the knowledge of armorial bearings, was mainly the outcome of the love of outward distinction which prevailed in mediaeval times. "Heraldry," says Stubbs, "became a handmaid of chivalry, and the marshalling of badges, crests, coat-armour, pennons, helmets and other devices of distinction grew into an important branch of knowledge." The *shield*, or *escutcheon*, is the ground upon which armorial signs are traced, the colour of the shield being called the *tincture*, the signs recorded the *charges*.

There are seven *tinctures—or* (gold), *argent* (silver), *gules* (red), *azure* (blue), *vert* (green), *purpure* (purple) and *sable* (black). The *charges* are classed as "Honourable" and "Subordinate" ordinaries, comprising lines and geometrical forms; and "Common" ordinaries, which latter includes all representations of natural objects.

There is also a system of external signs, such as crowns, mitres *etc.*, each having its distinctive significance. *See* **Hatchment, Quartering, Rampant.**

Heralds' College or College of Arms, was incorporated by Richard III in 1483. Its head is the Earl Marshal (an office hereditary in the family of the Dukes of Norfolk), and there are three Kings of Arms, six Heralds and four Pursuivants. The business transacted is wholly connected with the tracing of genealogies and the granting of armorial bearings. In Scotland the Heraldic functions are performed by the Lord Lyon King of Arms.

Herbarium, a systematically classified collection of preserved plants. One of the largest in the world is at the Royal Botanic Gardens at Kew.

Heredity is the study of the transmission of physical and mental characteristics from one generation to another. Gregor Mendel (1822–84) established the principle embodied in Mendel's law in his work published in 1866.

The ideas which he put forward were forgotten until the early years of the 20th century, but today they form the basis of the modern study of genetics. Genes are the units of heredity; they are contained in the chromosomes of the cell nucleus. In human cells there are 46 chromosomes—22 pairs of characteristic shape, and a 23rd (the sex chromosomes) similar in women and dissimilar in men, which unite in the process of fertilisation. An individual can only develop, even under the most favourable surroundings, as far as his inherited characteristics, *i.e.*, his genes will allow him to do. It is in the development of personality that the interplay between heredity and environment becomes most apparent.

Hermaphrodite, animals or plants possessing both male and female reproductive organs, *e.g.*, snails, earthworms, most flowering plants.

Hermit Crab, a decapod, with a soft asymmetrical body which it protects by thrusting it into an empty gastropod shell, *e.g.*, whelk, which it carries about, only abandoning it as needed for a larger one. Found in all seas, many live in commensal relationship with sea anemones *etc.*

Heron, a large wading bird with long curved neck and pointed bill, is a member of the *Ardeidae* family, of which there are many species. Egrets and bitterns are included as herons. Herons are to be met with in marsh lands and near rivers and lakes, where they feed on fish and frogs. They nest in trees in large numbers, these colonies being called *heronries*.

The common heron is native to England, and other species from the Continent are also visitors.

Herring (*Clupes harengus*), an important food-fish inhabiting the North Sea which has been subjected to much overfishing. In Britain the once-important herring industry is now based on the Shetlands and some coastal ports of E. Scotland and N.E. England. Marine biologists have reported on its unique structure for hearing which makes it receptive to sound frequencies over a very wide range and able to determine distance, direction and source of sound.

Hibernation, the dormant condition in which many mammals, reptiles, amphibians, insects, plants, *etc.*, pass the winter months. The rate of metabolism slows down, and the body temperature drops to that of the surroundings. Work on these low temperatures and their physiological effect has led to improved surgical techniques. Animals of the torrid regions pass through an analogous period (*aestivation*) during the hot season, when the sources of food are dried up. The only creatures in Britain to hibernate are bats, dormice and hedgehogs. The Alaskan squirrel has the longest hibernation.

Hickory, several species of American tree of the walnut family, remarkable for its very hard, solid, heavy white wood, and bearing an edible, four-lobed nut.

Hieroglyphics are the earliest form of pictured symbolic expressionn, and are supposed to have been introduced by the ancient Egyptians. They consist of varied depictions of animals, plants, signs and objects, and in their later examples express, in abridged form, ideas and records from which significant historical information has been gleaned. The deciphering of Egyptian hieroglyphics long proved elusive, but gradually the key to the riddle was discovered, and most of the ancient records can now be understood. Besides the Egyptian there are also Hittite, Minoan and Mayan hieroglyphic scripts. *See* **Rosetta Stone.**

Hi-Fi (**High Fidelity**). A term used since the late 1940s to describe domestic sound reproducing equipment and originally implying superlative performance and particularly stereo capability as opposed to mere mono. In this usage it is now somewhat dated. The criteria for hi-fidelity performance were originally difficult to achieve in practise and therefore the appellation was of some consequence, but recent advances in technology, design, component standards and quality assurance procedures have ensured that the criteria can be met by almost every product on the market. Recent usage does not necessarily imply a qualitative judgment but simply describes equipment for home use. A Hi Fi system would probably include a number of sources such as a turntable and a tonearm combination for replaying vinyl discs, a tuner for receiving radio broadcasts or a compact disc (CD) player, in combination with a pre-amplifier/amplifier and loudspeakers or headphones. Quite frequently some sort of recording device such as a cassette deck will also be present.

From the early 1980s the compact disc became the primary distribution medium for prerecorded music, almost completely replacing vinyl discs. It was not until the late 1980s that digital recording systems such as RDAT (Rotary-head Digital Audio Tape) became available. With the more recent developments of DCC (Digital Compact Cassette) and MD (Mini Disc), consumers now have a choice of digital recording systems.

Higgs Boson, nicknamed the 'God particle'. It is a sub-atomic particle that remains the only element of particle physics theory whose existence had not been absolutely confirmed. But scientists at CERN finally found it in 2012.

Hindi, the official language of India.

Hindustani, the spoken form of Hindi (written in Devanagari script) and Urdu (written in Arabic characters).

Hippogriff, a fabulous monster like a horse in body, but with the head, wings and front legs and claws of an eagle.

Hippopotamus (**"River-horse"**) is the largest living representative of the hippopotamidae family, widely distributed over Africa, where it lives in herds. It is of immense bulk, attaining a length of 3·6 m and a weight of 4 tonnes and stands about 1·5 m high. Its skin is hairless and about 5 cm thick, and it has a pair of tusks often weighing as much as 2·7 kg. It leads an amphibious way of life, and lives entirely on vegetation, both aquatic and terrestrial. The pigmy hippopotamus, which occurs in forests and swamps in W. Africa, is only half the size. Only around 3,000 are left in the wild. Hippos are now known to be related to dolphins and whales.

Histology is the study of the structure of plant and animal tissues. These mainly consist of groups of cells with similar functions, *e.g.* brain tissue.

Hobby, a bird of the falcon family, 30–35 cm long. Local breeding visitor to England and Wales, April September; irregular visitor to Scotland and Ireland. They winter in Africa.

Hog, the common name of animals of the Suidae family, including the wild boar, pig and sow. The wild boar, *Sus scrofa*, is the common ancestor. The skin of the hog is covered with bristles, the snout truncated and each foot has four hoofed toes. Hogs are omnivorous feeders and eat almost anything that is given them.

Hogmanay, the Scottish New Year's Eve festival and a national holiday of the country. The custom of demanding Hogmanay bread is still upheld in many parts of Scotland.

Hogshead, a cask of varying capacity, also a specific measure. In the old English measure a hogshead was 63 old gallons of wine (=52½ imperial gallons = 238·6 litres). Of beer 54 old gallons make a hogshead.

Holly, a hardy evergreen shrub, largely grown in England. Its bright dark green prickly curved leaves and clusters of red berries are familiar in all parts of the country, and used as house decoration between Christmas Eve and Twelfth Night, probably a relic from ancient customs. Its wood is white and hard, valued for carved work, while its bark yields a gummy substance which is converted into birdlime.

Holocaust. *See* **German Fascism, J19(2), Genocide (L45).**

Holocaust Memorial Day, first marked in Britain on 27 January 2001 (the anniversary of the liberation of Auschwitz-Birkenau in 1945). It is distinct from Yom HaShoah, the Jewish day of remembrance for the Jewish victims of the Nazis. This falls in late April.

Hologram, a photographic record, taken under special optical conditions, of light reflected from a scene or object. The hologram is typically a piece of film. However it is nothing like a photographic negative of the ordinary kind; for one thing it will show an unintelligible pattern of light and dark patches. Nevertheless if it is illuminated (again under special optical conditions) the light coming through it will form a *three dimensional* image of the original object. Another radical difference between a hologram and an ordinary film is that if the hologram is cut up, each fragment can be used to construct the entire image.

Holography, as a method of recording and reproducing photographic information, was conceived by Gabor in 1947 but was only fully realised in practice after the invention of the laser, which made available powerful sources of coherent light.

Holothurians. *See* **Sea Cucumbers.**

Holy Coat of Trèves, a garment preserved in the Cathedral of Trèves, said to have been worn by Christ. It was brought from Jerusalem by the Empress Helena in the 4th century.

Holy Grail. *See* **Grail.**

Holy Rood, an annual Roman Catholic festival held on 14 September to celebrate the Elevation of the Cross in commemoration of its re-erection in Jerusalem by the Emperor Heraclius in 628 after retaking it from the Persians. Also included in the Church of England calendar.

Holy Water, water blessed by a priest and kept in small fonts at the entrance to Roman Catholic and some Anglican churches.

Holy Week, the week before Easter Sunday, embracing the days of the Sufferings of Christ. It includes Good Friday and Holy Saturday.

Honey, the sweet syrup formed by bees from the nectar of flower, the sucrose in the nectar being converted into a mixture of the simple sugars, glucose and fructose. Hybla, an ancient town of Sicily, on the southern slope of Mt. Etna, was famous for its honey.

Honey-eater, an Australian bird (of which there are many species) provided with a long curved bill and tufted tongue. It lives by sucking the nectar from the flowers which abound in rural parts of Australia and New Zealand.

Hookah, an Oriental pipe for tobacco smoking, the smoke being drawn through the water of a goblet by means of a long flexible tube.

Hoopoe, a very handsome pink bird with vivid black and white-barred wings and tail and black-tipped crest which opens like a fan. It ranges over Europe, Asia and Africa. It has bred in England and Wales and occurs in the UK in small numbers at all seasons. Other species are confined to Africa, Madagascar and India.

It has now been officially chosen as the national bird of Israel.

Hops, the female "cones" of the hop plant used in brewing; their essential oils give to beer an aromatic flavour, and their tannin and resin act as a preservative as well as accounting for the bitter taste desired. The hop is a perennial climber belonging to the mulberry family. The male and female organs are on separate plants; as only the female flower-heads are commercially useful.

Female plants predominate in a hop garden, only a very few male plants being grown so that the female flowers can be fertilised.

Horizon, the limit of vision, the apparent line where sea and sky, or land and sky meet. This is termed the visible horizon. An ordinary person at the height of 1·5 m can see for 4·8 km, at 6 m 9·6 km, at 15 m 14·8 km and at 305 m 67·5 km. The figures are approximate.

Hormone, a chemical substance which is released by one part of the body and produces a response in other parts after having been carried there by the bloodstream or other transport system.

Prolactin, for example, is a hormone produced by the pituitary gland of nursing mothers and serves to stimulate and maintain the milk supply.

Horn *or* **French Horn,** a brass instrument of the trumpet family (*i.e.*, played by three valves) whose tube is very thin and long (Horn in F = 12 ft). In consequence the tube is curled in a complicated manner. Owing to the sweet tone it is capable of producing, the Horn sometimes plays as part of the wood-wind.

Hornbill, large bird found in Africa and oriental regions. Some species have a casque or a horny growth above the very powerful beak. It feeds on fruits. When the female has laid her eggs in the hollow of a tree, the male bird stops up the entrance, and keeps her imprisoned until the hatching is completed and the young ones are able to fly. There are *c.* 45 species. They mate for life. They also play a vital role in dispersing seeds in the rainforests.

Hornblende, the commonest member of the amphibole group of minerals, a silicate of calcium, magnesium, iron and aluminium, of a dark green colour. A constituent of numerous rocks.

Horned Viper, any of a number of species of African viper which have scales over each eye resembling horns. Their bite is usually very poisonous. The significance of the horns is not known.

Hornet, a name for many of the bigger wasps. It usually nests in hollow trees, and despite its rather fiercesome appearance does not sting unless unduly provoked. The Asian hornet is bigger and more destructive. Now found in the UK.

Horology, the science of time-measurement, including the construction and management of clocks, watches, *etc.* Instruments of this kind are not known to have existed before the 12th cent. and until the coming of the pendulum in the 17th cent., clocks were ill-regulated and frequently inaccurate.

The time-recording mechanisms of the present day include (*a*) the *clock*, which shows the hours and minutes by hands, and strikes the hours, and sometimes quarters; (*b*) the *timepiece*, which is not generally a fixture and shows the time, but does not strike; (*c*) the *watch*, which is a pocket timekeeper; (*d*) the *chronometer*, which indicates the minutest portions of times; (*e*) electric timepieces, mains electric clocks; (*f*) the highly accurate quartz- crystal and atomic clocks used for astronomical purposes. *See* **Clock.**

Horse Chestnut, one of the large forest trees, with ample branches, and full foliage, and much esteemed for parks and ornamental grounds. The flowers, which appear in May, are white tinged with red and yellow. The tree is native to mountainous northern Greece. The Bleeding Canker disease is lethal to horse chestnuts. *See also under* **Chestnut.**

Horse Guards, the building in Whitehall which until 1872 was the headquarters of the Commander-in-Chief of the British Army. The archway is still sentinelled by mounted guards.

Horse Latitudes, the latitudes of the sub-tropical high pressure systems, between the trade winds and the prevailing westerlies, characterised by light variable winds and low humidity.

Hospitallers, Knights. *See* **E6.**

Hottentots, name given to certain African people by Dutch settlers in the 17th cent. They used to occupy much of Cape Colony and though driven out a number still survive in Namibia.

Hounds are dogs that were originally bred and trained for hunting, such as the greyhound, foxhound, bloodhound, beagle, harrier, *etc.*, but now often kept also as domestic dogs.

The greyhound, deerhound and wolf hound hunt by sight, the others, with the bloodhound first in order, track by scent.

House Flies are world-wide and prolific. Their eggs are hatched within 24 hours of being laid, and full maturity is attained in a month. They feed on decayed animal and vegetable matter.

Hovercraft, or air cushion vehicle, is a craft which is lifted on a pad of air underneath it. This pad or cushion must be at a pressure higher than that of the atmosphere and it is made by sucking in air above the craft and ejecting it in a downward stream all round the lower edge. Hovercraft were devised by Cockerell in the 1950s and a full-scale example appeared in June 1959.

The air pad support means that hovercraft can move over land, water or marsh. Cross-Channel hovercraft were introduced in 1966. The last cross-Channel service was withdrawn in 2000.

Howler Monkey, a genus of South American monkey noted for a laryngeal conformation which enables it to emit a loud reverberant noise something between a yell and a howl.

Huanuco-bark, a medicinal bark, brought from the Peruvian town of that name, and derived from the *Cinchona micrantha* tree.

Hubble Constant, a mathematical value that assesses the speed at which the universe is expanding.

Hubble Telescope. *See* **Telescope.**

Hubble's Law, the law, first proposed by Edwin Hubble in 1929 stating that the velocity of a distant galaxy is directly proportional to its distance. This means that the most distant galaxies are moving fastest away from us.

Human Genome Project, the global scientific effort launched in the 1990s to unravel the human genetic blueprint. The tiny nematode worm became the first creature to have its entire genetic blueprint decoded. In 1999, for the first time, the complete genetic code of a human chromosome (chromosome 22) was deciphered. It revealed the existence of hundreds of genes, previously unknown in humans, but playing a vital role in disease. Scientists finished a preliminary draft of the human genome code in 2000. Scientists finished a complete sequence in April 2003. In 2012 the genetic "control panel" of the human body, which regulates the activity of our 23,000 genes was revealed for the first time.

Humble-bee (**Bumble-bee**), this is the common name of the insects of the genus *bombus*, of the Hymenoptera order. They live in small communities comprising males, females and drones, their habitations being underground. They do not have one queen bee only like the hive bee, but several females occupy the same nest, and these alone live through the winter, breeding and forming new colonies in the spring. Their sting does not have a barb like the honey bee's.

Humidity, the state of the atmosphere with respect to the water-vapour it contains. "Absolute humidity" is defined as the density of the vapour present, while "relative humidity" indicates the degree of saturation.

Humming Birds are so called because of the humming noise made by the vibration of their wings in flying (they flap their wings 50 times a second). They are of radiant plumage, and are among the smallest birds. The smallest bird in the world is the Fairy or Princess Helen's humming bird of Cuba, whose body is only 5·7 cm long. There are from four to five hundred species, and they are confined wholly to North and South America, being most numerous in the tropical latitudes. They have long, slender bills and tubular tongues which reach down into flowers to suck up the nectar on which they feed. They are crucial pollinators of flowering plants across the Americas.

Hummum, the original name for what is now called the Turkish Bath in the UK. One of the first of these baths was the Hummum in Covent Garden, London.

Hurdy-Gurdy, a rustic musical stringed instrument of the lute order, the sounds of which are produced by the action of a rosined wheel turned by the right hand, the notes being made by the fingering of the left hand. It dates from at least the 12th century.

Hurricane. *See* **Cyclone, Wind.**

Hydra, an aquatic animal of simple structure, whose body is in the form of a cylindrical tube, with a disc-shaped base by which it attaches itself to any shifting substance. Its mouth is surrounded by tentacles by which it catches its food. The Hydra can reproduce lost parts.

Hydrates are compounds containing water of crystallisation.

Hydraulic Ram, a form of automatic pump, used to raise water to a height by the action of its own falling velocity.

Hydraulics, the science of applied hydrodynamics, or water-machine engineering, ranging from pumps to marine engines.

Hydrocarbons are compounds of carbon and hydrogen. They include the *paraffins*, which are saturated compounds (*e.g.*, methane); the ethylene, acetylene and other series which are unsaturated; compounds with ring structures, *e.g.*, benzene, naphthalene and anthracene. Petroleum is composed almost entirely of hydrocarbons.

Hydrochloric Acid, a solution of hydrogen chloride gas in water, and resulting in considerable quantities as a by-product of the soda-ash or salt-cake manufacture. Its solution forms the common hydrochloric or muriatic acid of commerce. It is present to the extent of nearly half a per cent, in the digestive juice secreted by the stomach.

Hydrocyanic Acid, cyanide of hydrogen or prussic acid; very poisonous, and of the odour of bitter almonds. It is formed by the action of acids on sodium or potassium cyanide. Used to kill wasps (and in the gas chamber in the USA). It is a very important chemical on account of the reactions of its derivatives in many synthetic fields. Discovered by Scheele in 1782.

Hydroelectric Schemes. The sun's energy has been indirectly exploited in the past by harnessing the energy of the winds and rain. The climate is due, essentially, to differential heating of the earth. The resulting convection currents in the air (the motion of which is complicated by the rotation of the earth) give rise to winds. Moisture is collected from the sea and deposited high up on mountains as rain. Some of the gravitational energy may be collected as hydropower. Simple windmills or waterwheels are too undependable to be used.

The modern form of the waterwheel—the hydroelectric generation plant —is extensively used in mountainous countries and about a third of the world's electricity is produced by this means. The essential requirements for a modern hydroelectric scheme are a river with a sufficient flow of water to provide the required power, a large "head" of water so that a cheap, compact turbine can be used and a dam so that water can be stored until it is required. In some cases a hydroelectric scheme is made economic by being associated with an irrigation or drainage scheme. Such multi-purpose schemes are especially important in India and Pakistan, where most hydro projects are of this type. Other early examples include the Snowy Mountains scheme in Australia and the Aswan High Dam in Egypt. More recent is the massive Three Gorges Dam in China.

Although over 90 per cent of the electricity in certain individual countries, most notably Norway, Sweden, Portugal, Switzerland and Uganda is now produced from hydroelectric schemes, only a relatively small fraction of the total potential has been exploited. This fraction varies from about a third in Western Europe to a quarter in the United States to a very small fraction in Canada, Africa or Asia.

Hydrofluoric Acid is obtained by distillation of fluorspar with sulphuric acid, and is a compound of fluorine and hydrogen. Highly corrosive, it is a valuable agent in etching on glass, and a rapid decomposer of animal matter.

Hydrogen, symbol H, the simplest element, with an atomic number of 1, colourless, and the lightest of all substances. Cavendish in 1766 was the first to recognise that it was an element. It is 14·4 times as light as air, and is found in a free state in volcanic regions. It can be obtained by the action of metals on acids, and forms an explosive mixture with air, burning with oxygen to form water. Commercially it is used to produce the very hot flame of the oxyhydrogen blowpipe for cutting metals; to fill balloons and airships; to harden certain oils and render them suitable for margarine and soap production. In warfare, the hydrogen bomb is potentially hundreds of times more powerful than an atomic bomb.

The gas can be liquefied, and the presence of the isotope deuterium was detected by Urey in 1931 in the residue of the evaporated liquid. The third isotope, tritium, is very rare. Vast quantities of hydrogen gas are thought to exist in the Earth's crust. *See also* **Deuterium, Tritium.**

Hydrogen Sulphide is the toxic, flammable colourless gas (produced by humans and animals as wind).

Hydrography, the science of water measurement, as applied to seas, rivers, lakes, currents, reefs, *etc.*, and embracing the whole art of navigation.

Hydrometer, an instrument for measuring the specific gravity of liquids, especially for ascertaining the strength of spiritous liquors and solutions. It is usually in the form of a glass bulb, to the lower end of which a smaller bulb, containing mercury, is attached which forces the instrument to sink into the liquid which it is to test. The larger bulb has a scale fixed to it, and the indication on this scale of the sinking point shows the specific gravity. There are many varieties: Twaddell's—a pear-shaped bulb containing mercury: Beaumé's, of similar construction, but applicable to liquids both heavier and lighter than water: Sykes', largely employed for determinining the strength of alcohol: and Nicholson's, used for taking the specific gravities of solids.

Hydropathy, the method of treating disease with water, either by bathing or drinking. Natural springs of special chemical and therapeutic properties, such as sulphur springs, and other mineral sources, have been used since prehistoric times for this purpose. It is probably one of the most ancient methods of cure. The beneficial effects of pure water treatment have long been advocated. Hydropathic establishments have been set up in many health resorts.

Hydropolitics, term for the political struggle for water resources.

Hydroponics, or soilless growth, is the craft and science of growing plants in liquid nutrients instead of soil. Originally a laboratory technique, hydroponics has become since the 1930s a practical method of vegetable, fruit and flower production on both small and large scale. Basically, the growing plants have their roots in troughs of nutrient solution, either in or out of doors. Advantages include: much higher crop yields; the close control of weeds and diseases; quicker growth; and, very important, the possibilities of growing food in places where ordinary agriculture would be impracticable, *e.g.*, deserts and stony land, city roofs, in houses and in remote situations like Antarctic stations.

Hydroponics is widely practised and contributes usefully to agriculture and horticulture in many countries, including the USA, Britain, India and France. Its value in spaceships and planetary colonies has often been pointed out.

Hydrostatics, the science of the pressure and equilibrium of liquids that are non-elastic.

Hydrozoa are a class of water animals of the *Coelenterata* phylum to which hydra (*q.v.*) belongs. In one order of the hydrozoa, free-swimming colonies showing marked division of labour between the individual units occur; this order includes the Portuguese man-of-war.

Hyena, a nocturnal carnivore with powerful jaws. The striped hyenas inhabit N. Africa and S.W. India. The brown hyenas with long shaggy hair are natives of S. Africa. The spotted, or laughing hyena, noted for the cry from which its name is derived, is also confined to Africa. Hyenas are more intelligent than previously believed.

Hygrometer, an instrument for measuring the amount of water vapour in the atmosphere. A simple form of hygrometer, known as the wet-and-dry bulb, consists of two vertical thermometers affixed to a frame. One bulb is exposed to the air, and the other is covered with muslin which dips into a water-bath to keep it moist. If the air is saturated, it takes up no moisture from the wet bulb and the two thermometers read the same. If the air is not saturated, evaporation takes place from the wet bulb, latent heat is absorbed from the air and the temperature of the wet bulb is lower than that of the dry bulb. Relative humidity and dew-point of the air can then be derived from suitable tables. Hygrometers depending upon the expansion of human hair and gold-beater's skin and the deposition of dew on a polished surface, when cooled sufficiently, are also in general use. *See* **Humidity.**

Hymenoptera, the order of insects to which bees, wasps, hornets, ants and sawflies belong. They have a well-defined waist, two pairs of membranous wings coupled together, mouth parts modified for biting or sucking; the females possess an ovipositor used for depositing eggs and is sometimes modified for stinging. There are over 70,000 species in this order and many live in highly organised communities. *See also* **Ichneumon Fly.**

Hyperbola. A curve described by certain comets that go round the sun and never return.

Hypsometer, an instrument formerly used by mountaineers to find the height above sea-level by indirectly measuring the atmospheric pressure by determining the boiling point of water at the particular height. Based on the fact that as pressure decreases with height so the boiling point is lowered. Superseded by the aneroid barometer.

I

Iapetus. The icy moon of Saturn. It has a unique ridge (the Great Wall) running round its equator.

Ibex, wild goats of several species found in the mountain regions of Europe, Asia and Africa. The male has exceedingly large curved ridged horns. The species that lives in the Alps is called the Steinbock or bouquetin. The Pyrenean ibex (or *bucardo*) was hunted to extinction.

Ibis, belongs to a family of birds related to the stork. The sacred ibis of ancient Egypt is now extinct in Egypt but is found in the lakes and swamps of the Sudan near the Upper Nile. It has white and black plumage and a long curved beak. Other species are found elsewhere, the Glossy Ibis (black plumage glossed with purple and green) occasionally visiting England. There are now less than 220 Bald Ibis in the world (all in Morocco).

Ibo (Igbo), a numerous people of S.E. Nigeria. After the end of British rule they were active in their struggle for national independence and under their leader, Ojukwu, embarked upon the secessionist state of Biafra and the unsuccessful civil war against Federal forces. Today there are over 20 million Ibo speakers. The Hausa and the Yoruba are the other main Nigerian groups.

Ice is frozen water. It is a colourless, crystalline and brittle solid. Being only 92% as dense as water, it floats on the latter; the expansion which occurs as water changes into ice causes the fracture of water-pipes, though the fracture only becomes obvious when the ice melts and leaks out through the crack. The temperature at which ice forms is 0°C, 32°F. Ice can be melted by pressure, and the ease and smoothness with which one is able to skate on ice depends on this phenomenon.

Ice Ages. Periods during which the continents were partly or largely covered by ice-sheets and glaciers. The present-day ice-sheets of Greenland and Antarctica are relics of the most recent ice age (one of the eight major ones during the past 700,000 years), which began in the Pleistocene and ended about 10,000 years ago. During this last great glaciation ice sheets covered the northern part of Europe, Asia and North America. Carbon dioxide escaping from the depths of the ocean helped end the last Ice Age. There is evidence that periodic changes in the earth's orbit around the sun caused the ice ages. The earth is now in one of its warm periods.

During the last Ice Age Britain was home to woolly rhinoceroses, mammoths, reindeer *etc.*

A "Little Ice Age" gripped Europe from the mid-1400s until the mid-1800s, and was at its coldest from 1645 to 1715. The worst winter of all was 1683–84.

Icebergs are detached masses of glacier which subside into the sea and float as wind or current may take them. About one-ninth of an iceberg is above sea-level. The North Atlantic is the chief home of icebergs, which reach the ocean from the ice-clad plateaux of Greenland. Some of these floating masses of ice are of enormous proportions, and in the spring and early summer seasons are a great menace to the safety of ships, as was disastrously shown in the *Titanic* catastrophe of 1912. The increasing numbers of icebergs provide evidence of global warming and pose a growing risk to shipping. The largest iceberg ever recorded (half the size of Wales) broke away from the Ross Ice Shelf in Antarctica in 2000.

Ice-breaker, a special heavy bow-plated ship for forcing a way through ice and used especially at ports of the Baltic Sea and the Great Lakes region of Canada which freeze during the winter.

Icelandic Literature, the old Norse literature, centred about Iceland, which includes numerous works of poetry, mythology and history of interest and importance. Much of this literature is in the saga form. *See also* **Edda.**

Iceland Moss, a kind of lichen (*Cetrario islandica*) which grows in great quantities in the mountain regions of Iceland and other Northern countries. It possesses certain nutritive qualities and is of some value in medicine.

Iceland Spar, a colourless form of calcite (calcium carbonate), frequently found in association with metallic ores; it has the power to produce strong double refraction of light so that two images are seen of an object viewed through a piece of Iceland spar. Once used in optical apparatus for producing polarised light.

Iceni, an ancient British people who lived in Norfolk and other parts of Eastern England. Their most famous ruler was Queen Boadicea (Boudicca), who led her people against the Romans in A.D. 61.

Ice Giants, The frozen planets such as Neptune and Uranus.

Ice Man, name given to the frozen corpse of a middle-aged man, 5,300 years old, found in 1991 on a glacier in the Ötztal Alps. It is now thought that Ötzi (as he is known) died from a lesion in an artery in his left shoulder caused by an arrowhead. His full genome was decoded in 2012. He suffered from a very modern problem: tooth decay caused by sugar.

Ice Plant, also called "dew plant" and "diamond plant". A South African mesembryanthemum commonly grown in British gardens. from 1690.

Ice Saints, St. Mamertus, St. Pancras, St. Servatius and St. Boniface, so called because of the legendary cold on these Saints' Days, namely, 11–14 May.

Ichneumon, the Egyptian mongoose, popularly known as "Pharaoh's Rat". It is of great use in checking the multiplication of reptiles. It is frequently domesticated.

Ichneumon Fly, a numerous group of parasitic hymenopterous insects abounding in many lands, and all having the peculiarity of depositing their eggs in the bodies of other insects. It destroys swarms of caterpillars, which become the unwilling hosts of its progeny.

Ichthyology, the natural history of fishes.

Ichthyosaurus was a gigantic marine reptile of the Mesozoic age. The fossils are mostly found in the lias formation. Some were over 9 m.

Icon, an image of a sacred personage used in the home or in churches for devotional purposes. Icons can be painted on wood, perhaps with the figures picked out against a golden background, or they can be cast in bronze, in the form of a crucifix, diptych (*q.v.*) or triptych with details in coloured enamels. Subjects are taken from the life of Christ or of the Saints. In churches several icons are sometimes placed together on a screen (the iconostasis, which divides the altar and sanctuary from the main body of the church). The earliest preserved icons date from the 12th cent.

Icons are much venerated in Russia and remain, still in their archaic stylised form of mediaeval origin, a characteristic feature of the Greek and Russian Orthodox Churches.

The violent destruction of icons (*iconoclasm*) was a feature of the Protestant reformation.

ID Cards. Today *c.* 100 countries have compulsory ID cards, including Germany, Belgium and Spain. The ID cards introduced in Britain during the Second World War were abolished in 1952. ID cards became compulsory for students from outside the EU from November 2008. They are credit-card size plastic strips with the holder's name, photo, reference no. *etc.*

India, with its 1·2 billion people, is planning to introduce cyber-age biometric ID cards.

Ides, in the ancient Roman Calendar, the 15th of March, May, July, October, and the 13th of all other months; always the eighth day after the Nones.

Idiom, an expression characteristic of a country, district, dialect or language, which usually gives strength and force to a phrase or sentence. The idioms of a language are its distinctive marks, and the best writers are the most idiomatic.

Idris, a famous giant belonging to the myths of Wales, commemorated by a chair of rock on the top of the Cader Idris mountain in Gwynedd.

Igneous Rocks are such as have been molten under conditions of great heat at some stage in their history: *e.g.*, granite, basalt.

Ignis Fatuus *or* **"Will-o'-the-wisp",** a phosphorescent light which may often be seen on summer and autumn evenings hovering over marshy ground or graveyards. Its nature is hardly understood, though it is generally believed to be the result of the spontaneous combustion of the gases from decaying organic matter.

In ancient times when marshy grounds were common, this "dancing light" was very frequently visible and was regarded with superstition.

Iguana, large South American lizard, with a long tail, a scaly back and head, a thick fleshy tongue and a prominent dew-lap in the throat. Specimens of the different species average 1·2–1·5 m in length, and they live mostly in trees, though they are equally at home on land or in the water. The flesh of some species is sometimes eaten, as are also the eggs. The tails of iguanas may sometimes be twice as long as their bodies. Marine iguanas graze on the sea flooor.

Iguanodon, a genus of extinct dinosaurs, whose fossils are found in the Jurassic and Cretaceous rocks. Iguanodons were 4·5–7·6 m long, and walked on their hind legs, the front legs being small and adapted for grasping the branches of trees on the leaves of which they fed.

Ilex, mentioned by classical authors, the holm- or holly-oak, which flourishes round the Mediterranean. To botanists Ilex is the genus to which the holly and maté plant belong.

Iliad, the great epic poem of ancient Greece attributed to Homer (*c.* 700 B.C.). It consists of ancient folk tale and saga, welded into an artistic unity, having as plot the abduction of Helen by Paris to Troy and the subsequent siege of Troy.

Ilmenite, a mineral widespread in igneous rocks: chemically it is an oxide of iron and titanium. Rich deposits have recently been found in the Allard Lake area of Quebec: the Travancore sands are also a source of ilmenite.

Immortelles are wreaths, crosses or other designs made from what are called everlasting flowers, which are obtained from certain plants of the Composite order, and retain their colours and compactness for a long time. Immortelles are largely used as mementoes for decorating graves.

Imprimatur, originally an official licence to print and an important formula in the early days of printing.

Incas, an Indian people who inhabited ancient Peru, founded a great empire and civilisation; overthrown by the Spaniards in 1533. It was the largest pre-Columbian empire, embracing 10 million people with an advanced network of roads.

Incense, an aromatic resinous substance which, under combustion, exhales a pungent odour, and is used, mixed with certain fragment perfumes, in the celebration of Mass in Roman Catholic churches. Olibanum or frankincense is ordinarily the leading ingredient.

Incisors, the sharp-edged cutting teeth at the front of mammalian jaws. Rodents have long, sharp incisor teeth. Elephant tusks are modified incisors.

Independence Day, commemorates the adoption of the Declaration of Independence on 4 July 1776. 4 July is celebrated as a holiday in the USA.

Independent Schools. *See under* **Public Schools**.

Index. The name given to a list of books, prepared by papal authority, which are declared to be dangerous to faith and morals, and therefore forbidden to Roman Catholics, called the *Index librorum prohibitorum.* One of the reforms of the Vatican Council was the closing in 1966 of the Curia office which judged writings for the Church's Index of forbidden books, though the Index itself still remains. The Pope ordered that nothing should be placed on the Index until the author had been given a chance of explaining his views. The first Index was issued by Pope Pius IV, in 1559.

Indian Summer, a period of dry, sunny weather extending deep into autumn. The term comes from early settlers in North America.

Indicators, substances which by a marked change in colour are used to indicate the course of a chemical reaction. Litmus paper, for instance, is red with acids and blue with alkalis. In biological work some radioactive substances are used as tracer elements.

Indigo, the substance obtained from the plant *Indigofera tinctoria*, a native of S. Asia, India being the chief producing country. The colouring matter is the result of the decomposition and fermentation of a glucoside contained in the plant. This is afterwards dried and becomes the caked indigo of commerce. Natural indigo has been eclipsed by artificial indigo, a coal-tar dye which came into commercial production at the end of the last century, and which is cheaper and more uniform in quality.

Indium, a scarce lead-coloured metallic element, no. 49, symbol In, found in zinc blende in Saxony and certain other ores. Discovered in 1863 by Reich and Richter. It is an important material in the manufacture of transistors.

Indo-European Languages. Term for a wide spectrum of languages whose common origin has been traced to Anatolia (Turkey), *c.* 9,500 years ago. The languages include English, German, French, Spanish, Russian, Persian, Hindi *etc.*

Indulgence. In the Catholic Church the remission granted by ecclesiastical authority to a repentant sinner of the temporal punishment still due after the guilt of sin has been forgiven by God.

The indiscriminate sale of Indulgences by Tetzel and other Papal agents in the 16th cent. was one of the grievances which led to the Reformation. The Council of Trent made such traffic unlawful. They were associated with some of the worst examples of corruption.

Industrial Archaeology, the study and recording of the buildings, equipment *etc* of past industry.

Industrialisation is simply a name for industrial development. It is customarily used in particular to designate the course of events in a hitherto underdeveloped country which is seeking to increase its wealth and productivity by the introduction of more advanced techniques and by the establishment of industries previously not carried on within it. The word usually covers not only the development of modern industrial production but also the provision of electric power-stations, irrigation works and transport and other developments designed to improve production in any field by methods involving large capital investments. One often-quoted example by historians of rapid industrialisation was the Soviet Union, which, because it was unable to get the capital from abroad, had to carry it through by ruthless restriction of the people's consuming power.

Industrialisation has usually meant a high concentration on the expansion of the basic heavy industries and of power supply, coupled with much slower development of the industries supplying consumer goods and of agricultural production.

Inert Gases. *See* **Rare Gases**.

Inertia, a term used in mechanics for the property of matter by which it offers resistance to a change in its state of rest or in its state or direction of motion.

Inertial Navigation, an automatic method of dead-reckoning which at present finds its chief application in guided missiles, submarines and aircraft. Navigation by this means is carried out with reference to inertial space (*i.e.*, space which is stationary with respect to the fixed stars) and not to the surface of the earth as in normal navigation (latitude and longitude). This is done by means of high-accuracy gyroscopes combined with highly sensitive accelerometers in an apparatus known as the Ship's Inertial Navigation System. The American nuclear-powered submarine *Nautilus* pioneered the new north-west passage under the polar ice by this method of dead-reckoning in 1958.

Inflorescence, a flowering shoot. Many arrangements of the flowers are possible and there are many kinds of inflorescence; *e.g.*, the spike, catkin, umbel, capitulum (in composites).

Infra-red Radiation, electromagnetic radiation lying between the radio and visible bands of the electromagnetic spectrum. The wavelengths involved are from 0·8 micrometres ($0{\cdot}8 \times 10^{-6}$) to 1000 micrometres. Astronomers sub-divide this waveband into near, mid and far infra-red. Radiation above 300 micrometres is now called submillimetre radiation. Infra-red photography uses materials specially sensitized to infra-red radiation; applications include night time photography, haze-penetration and camouflage and forgery detection.

Infra-red Space Observatory (**ISO**), an orbiting telescope launched in 1995. By peering into the clouds of gas and dust in deep space it astonished astronomers by discovering vast quantities of water in the deserts of space. It ceased functioning in 1998. The Space Infra-Red Telescope Facility, the largest, most sensitive telescope of its type sent into space, was launched in 2003.

Infula, a sacred fillet, of woollen material, worn on the forehead by priests, magistrates and rulers in Roman times, also by persons fleeing for protection to sanctuary. Later, each of the two lappets of a bishop's mitre.

Ingoldsby Legends, a series of whimsical metrical tales written by the Rev. R. H. Barham, and first published in *Bentley's Miscellany* in 1837. The best known is the *Jackdaw of Rheims.*

Initiative. *See* **Referendum.**

Ink, a liquid pigment ordinarily made from an infusion of nut-galls, copperas and gum arabic. Shumac is substituted for nut-galls for inferior inks. An acid is sometimes added to prevent oxidation, and for the blue-black inks a small quantity of solution of indigo serves for colouring. Copying ink contains glycerine or sugar, which keeps the ink moist. Lampblack used to be the leading ingredient in printer's ink but now new methods of manufacturing have been developed. Marking ink is composed of a solution of nitrate of silver, gum, ammonia and carbonate of soda. For red, blue and other coloured inks, colouring solutions are used, *e.g.* Prussian blue. The earliest examples of ink writing (on wooden tablets) ever found in Britain were recovered from the well of a Roman villa (3rd cent. A.D.) at Chew Stoke, Somerset in 1954.

Ink Sac, a glandular organ found in squids and other cephalopods which contains an inky solution. When roused the animal discharges the contents of the ink sac into the water, to make a cloud through which its enemies cannot see. The pigment, sepia, comes from the ink sac of the cuttlefish.

Inns of Court, the four bodies in London which enjoy the privilege of calling candidates to the bar after they have studied for a certain number of terms and passed certain examinations. The Inns are: the Inner Temple, the Middle Temple, Lincoln's Inn and Gray's Inn.

Inquisition, a Roman Catholic ecclesiastical court which became a formidable weapon of the Church in the 13th cent. under Pope Innocent III in dealing with charges of heresy. It was effectively set up in the various Catholic countries of the Continent, obtaining its fullest and most sweeping organisation in Spain in the days of Ferdinand and Isabella, when Torquemada was made Grand Inquisitor, and used its powers with terrible severity. (*See* **Auto-da-fé**). In the 18th century its influence began to wane, and the jurisdiction of the Congregation of the Holy Office at Rome was limited to the suppression of heretical literature (*see* **Index**).

The attitude of the Catholic Church to the Inquisition is now changing.

Insectivorous Plants, plants which trap insects with special mechanisms. Plant enzymes or bacteria digest the prey, providing the plants with nitrogen usually scarce in the soil in which they grow. The most common British species are the Sun-dew and the Bladderwort.

Insects. This huge class of invertebrate animals (*see* **Arthropods, Section T**) includes over one million species. Insects are ubiquitous except in the sea, only a very few species being adapted to marine existence. Characteristic features are: the body is divided into three parts, head, thorax and abdomen: the head carries a pair of antennae, the thorax three pairs of legs and usually two pairs of wings. The most primitive insects constituting the sub-class *Apterygota* are wingless.

The other important sub-class, *Pterygota*, is divided into the *Exopterygota* (*Hemimetabola*), which have a simple metamorphosis, *e.g.*, cockroach, and the *Endopterygota* (*Holometabola*), with a complex metamorphosis, *e.g.*, butterfly, bee. Although many are parasitic on man, animals and plants, innumerable animals and some plants use them as food, and many flowering plants are dependent on a variety of insects for pollination. The disappearance of insect species in Britain is now of major concern.

Insignia, marks or badges of office or honour, such as stars, ribbons, *etc.*

Institut de France was formed in 1795, and after various modifications was in 1832 organised on its present basis. Its five academies are—the Académie Française, Académie des Inscriptions et Belles-Lettres, Académie des Sciences, Académie des Beaux-Arts, and the Académie des Sciences morales et politiques. It is restricted to 40 members.

Instruments, Musical. Musical instruments may be classified in a number of ways, but in general they fall into one of the three main classes, String, Wind and Percussion, according to how the sound in produced.

Stringed Instruments are those which produce the sound by the vibration of a string: (*a*) by plucking, as in Harp, Lyre, Psaltery, Zither, Lute, Guitar, Balalaika, Ukelele, Harpsichord; (*b*) by friction (bowed), as in Crwth, Rebec, Viol, Violin, Marine Trumpet, Hurdy-Gurdy; (*c*) by striking (hammered), as in Dulcimer, Pianoforte, Clavichord; (*d*) by wind (blown), as in the Aeolian Harp.

Wind Instruments are those in which the air in the instruments is set in vibration: (*a*) by blowing into a tube (flue-voiced), as in Recorder, Pandean Pipe, Flute, Organ; (*b*) by means of reeds (reed-voiced), as in Oboe, Clarinet, Saxophone, Bagpipe, Cor Anglais, Bassoon, Organ reed-stops; (*c*) those in which the sound is produced by the vibration of the player's lips against the mouthpiece (lip-voiced), as in Bugle, Horn, Trumpet, Tuba, Trombone, Saxhorn, Flügelhorn, Cornet. In the modern orchestra these are the *Brass*: the flute, oboe and clarinet families are the *Woodwinds.*

Percussion Instruments include the Drums, Cymbals, Tambourines, Castenets.

Insulator, a substance that will not conduct electric current. Many solids, liquids and gases are important insulators—rubber, cotton, silk, plastics, porcelain, glass, air, oil. If the applied voltage is too high, all insulators will "break down", *i.e.*, conduct electricity perhaps with resulting breakage, puncture or charring.

Thermal insulators will not conduct heat; they are usually the same kinds of substance as electrical insulators.

Intelligence. Intelligence has been variously defined as the innate potential of a person to learn and understand; to make appropriate judgments; to see the relationships between things; to profit from experience; or to meet adequately new problems and conditions in life. There are many lines of evidence to show that intellectual capacity is closely related to heredity and influenced by environmental factors. The idea of intelligence testing was first devised by the French psychologist Binet at the start of the 20th century. He was asked by the French government to invent a test which would weed out backward children in state schools, and thus save public money and avoid holding back the work of the class by teaching children who were incapable of learning at a given standard.

Briefly, a series of problems are given to a large number of children and it is thus found out which series can be solved by the average child of a given age-group; if a child of 7 can only pass the tests suitable to the average child of 6, then his mental age is 6. The intelligence quotient or IQ is discovered by dividing his mental age by his chronological age and multiplying by 100. A gifted child can usually be spotted at an early age. Although IQ tests are the standard method of estimating intelligence, they are not universally accepted as a criterion; a teacher's general judgment may be the best assessment. High intelligence may be inherited, but fail to develop to the full because facilities for education are not available.

Recent research suggests that the growth of the brain may be permanently affected by undernutrition at the time of its fastest growth (the last weeks before birth, and, to a lesser extent, the first weeks after birth). At this vulnerable period even minor deprivation can affect the rate and final extent of growth of the brain.

Interest is the payment made for the use of borrowed money over time. The rate of interest is the rate per cent per annum charged for such loans. There are many such rates, varying with the length of time for which the loans are made, and with the degree of risk, if any, that the loans will not be duly repaid. Short-term loans are usually cheaper than long-term: the lowest rates are usually for "call money" repayable immediately on demand.

Bank loans, though usually made for fairly short terms, command higher rates. Long-term loans are made chiefly to public authorities, or as bonds or debentures to business concerns.

International Criminal Court (**ICC**) is the first-ever permanent, treaty-based criminal court. It was established by the UN to prosecute and punish war crimes, genocide and "crimes against humanity". It was established in 2002 at The Hague. In recent years some African countries, as well as Russia, have left.

International Date Line, a line along the 180° meridian marking the difference in time between E. and W. For the westward-bound traveller crossing the line the date would be put forward one day, for the eastward-bound, back one day. To avoid difference of date in adjacent land areas, the line deviates from the 180° meridian where this crosses land.

International Standard Book Numbers (**ISBNs**), the system used to identify uniquely a title or edition of a book. The old 10-digit figure increased to 13 in January 2007.

Introit, the psalm sung by the choir as the priest approaches the altar to celebrate the Eucharist.

Inuit. *See under* **Eskimo.**

Invention of the Cross is the Roman Catholic festival held on 3 May, to celebrate the finding of the alleged True Cross at Calvary by the Empress St. Helena in 326. Also included in the Church of England calendar. *See* **Holy Rood.**

Io, satellite of Jupiter (*q.v.*). It was discovered by Galileo in 1610. It is the most volcanically active place in our solar system. (just one volcano on Io sends out more heat than all the volcanoes on Earth). Temperatures of 1700°C have been recorded and there are *c.* 300–500 active volcanoes. Scientists have observed new forms of mountain-building not seen anywhere else. In 2001, scientists discovered a giant 47-mile wide crater (called Tupan Patera) on the surface of Io. Its yellow surface is made up of frozen sulphur.

Iodine, a non-metal element, no. 53, symbol I, member of the halogen family (*q.v.*), a substance formerly exclusively obtained from the ribbon-wrack seaweeds. These were burnt and the ashes (kelp) extracted with water. After concentrating the iodides, these were distilled with manganese dioxide and sulphuric acid to yield iodine vapour which was condensed in stoneware bottles. Nearly all iodine now in use is derived from the iodine salt present in Chile saltpetre (natural sodium nitrate). Iodine is used in photography, as an antiseptic solution in alcohol or potassium iodide (tincture of iodine), and in medicine. Doctors are now concerned about rising levels of iodine deficiency (especially in pregnant women).Discovered by Courtois in 1812.

Ionosphere. Although a certain degree of ionisation occurs at all levels of the atmosphere due to cosmic rays and the radioactivity of rocks, *etc.*, the ionosphere is normally denoted as the region above about 70 km where the ultra-violet component of sunlight is able to ionise a significant fraction of the atoms and molecules present. This ionisation causes the reflection of radio waves by which the ionosphere was initially discovered and for many years, explored.

The nomenclature of the ionospheric layers "D" region up to about 95 km, "E" region 95 km to about 180 km, and "F" region above 180 km—is due to the historical observations of radio wave reflections from these "layers". Satellite and rocket observations have shown that the structure is in fact more continuous.

Solar flares and aurora cause enhancements of the electron density in the ionosphere, which may result in the disturbance of radio communications over very large distances (radio blackouts). *See also under* **Atmosphere, Aurora, Magnetosphere.**

Ions, electrically charged atoms, or groups of atoms. Atoms of the metals lose electrons to become positively charged ions, *e.g.*, the sodium ion (Na^+) has one electron less than the atom. The non-metal ions are negatively charged, *e.g.*, the chloride ion (Cl^-) has one electron more than the atom. Similarly, a group like the sulphate ion (SO_4^{2-}) has more electrons than the constituent atoms. Thus, the hydrogen atom without its electron is a hydrogen ion or *proton* and the helium atom without its two electrons is a helium ion or *alpha-particle.*

When an electric force is applied to certain solutions, the ions into which molecules of the dissolved substance are broken up are attracted to the oppositely charged electrodes, their movements constituting an electric current through the solution. In the same way gases, including air, conduct electricity by virtue of free ions. Combustion, radio-activity and ultra-violet and cosmic radiations produce ionisation.

iPhone, is the latest development of the mobile phone. It offers music, Internet access, e-mail and an advanced digital camera. It also plays videos, shows album artwork and can function as a personal organiser, *etc.*

Iridium, a white and very hard metallic element, no. 77, symbol Ir, discovered by Tennant in 1804. It occurs naturally as an alloy with platinum or osmium; tips for fountain-pen nibs have been made from the former native alloy. The former standard metre was composed of platinum–iridium alloy (*see* **Metre**) as are parts of scientific apparatus and surgical tools that must be non-corrodible.

Iris, the typical genus of the botanical order *Iridacae*, with tuberous rhizomes and swordshaped leaves, many of the family having beautiful flowers. About 100 species of Iris are recorded from the northern temperate zone, the most common species wild in Britain being the yellow flag. Orris root, used in perfumery, comes from another iris species.

Iron is a metallic element, no. 26, symbol Fe (Latin *ferrum*), occurring widely in nature in such ores as haematite, loadstone (magnetic iron oxide), spathic ore and iron pyrites. It is extracted by a process known as smelting, with coke and limestone in a furnace. Its many uses are familiar, the most important being in the manufacture of cast- and wrought-iron products and of steels, which are alloys mainly of iron with added carbon and various metals. Iron rust is formed by the action of oxygen and water, and is a coating of iron oxide. *See* **Smelting.**

Ironclads, ships of war cased in iron or steel plates of sufficient thickness to resist projectiles. They were first introduced (1858) in the French Navy, and in 1860 the first British ironclad, the *Warrior*, was launched.

Irrational Number, a number such as the square root of two, or pi, which cannot be expressed as the ratio of two whole numbers. *See* **Rational Number,** and ***Pi***.

Irrigation, an artificial method of providing water for the growth of plants on lands where the natural supply of water is deficient. For many hundreds of years techniques of irrigation have been slow and primitive (*e.g.*, tanks, inundation canals and the Archimedes screw) and consequent inefficiencies include large water losses by evaporation and seepage, and the watering of only a small area. New developments in perennial irrigation, using barrages, large reservoirs and pumping stations, permit vast tracts of land to be irrigated. Yet these are not without their problems as witnessed after the construction of the Aswan High Dam on the Nile where complex problems of delta erosion and dam lake silting ensued. Irrigation also serves the purpose of supplying *warmth* in winter; *e.g.*, in the English water-meadows, and in the more highly developed Italian *marcite* and winter-meadows, where the water is mostly applied in winter when there is plenty of rain. There are several other functions of irrigation; *e.g.*, washing out of excess salts and the renewing of fertility by the addition of alluvium.

Isobars are the lines drawn on charts linking together points of equal barometric pressure.

Isochasms, lines connecting places at which there is an equal probability of seeing an aurora, taking the average over a number of years, based on the auroral catalogue of Fritz.

Isomers are chemical compounds having the same composition but different structural arrangements, and consequently different physical and chemical properties. For example, ethyl alcohol and methyl ether are isomers, since the molecules of both are built up of two atoms of carbon, six of hydrogen and one of oxygen, *viz.*, C_2H_6O; ethyl alcohol, C_2H_5OH; and methyl ether, CH_3OCH_3.

Isotherms are lines drawn on charts through points of equal temperature.

Isotopes. When one talks of an element, say, uranium or lead, the name of the element is a generic name for a collection of uranium species and lead species. The different species are called isotopes. For any particular element, the number and arrangement of electrons around the nucleus are the same in all the isotopes, so all the isotopes have the same chemical properties. Soddy has described isotopes as "elements, the atoms of which have similar outsides but different insides".

For example, in the nucleus of the uranium isotopes, U 235, U 238 and U 239, there are respectively 143, 146 and 147 neutrons, but all have 92 protons. The isotopes have different atomic weights, in this instance respectively 235, 238 and 239. All have the same chemical properties.

Ivory, the dentine substance of which the tusks of the elephant, hippopotamus, walrus, *etc.*, are composed. The tusks of the African elephant sometimes weigh as much as 45 kg, and reach a length of 2·4–2·7 m. A world-wide ban on trading in ivory was imposed in 1990, but pressure has resulted in a partial lifting of this ban.

Ivory Gull, a small, beautifully shaped sea-bird with striking all-white plumage and black legs which breeds on the rocky shores of the Arctic, being found farther north than any other bird; it occasionally wanders south in the winter.

J

Jabiru, the Brazilian name for the giant stork of South America.

Jacamar, from *Jacameri*, the Brazilian name for a smallish bird with long, sharply pointed bill and brilliant plumage which inhabits the tropical regions of South America east of the Andes. These birds are seen sitting motionless on trees, darting off at intervals, like flycatchers, to catch insects on the wing.

Jacanas, small water birds with immensely long toes which enable them to walk on water lily leaves. They are sometimes called "lily-trotters" and are found in tropical Africa and America. They live in swamps and feed on seeds and insects. Sometimes brilliantly coloured.

Jack, a small schooner-rigged vessel, used in the Newfoundland fisheries; a pike; an oscillating lever; a device used in roasting meat.

Jackal, *Canis aureus*, a small wild dog related to the wolf and resembling a fox. The Common Jackal is found in S.E. Europe, India and Sri Lanka; other species inhabit Africa and Egypt. The jackal is a well-known scavenger. It hunts singly or in pairs, unlike the wolf.

Jackdaw, one of the smaller members of the Crow family. This European bird is typically black with grey collar. It is easily tamed and delights in making off with and taking to its nest bright objects, such as silverware.

Jade, an exquisite kind of hardstone, ranging in colour from a whitish green to a deep mauvish brown. It can be translucent or opaque and sometimes it is veined. Jade is the common name for two minerals—the rarer *jadeite* (found in Burma, Tibet and China), a sodium-aluminium-silicate, and *nephrite* (found in New Zealand, China, Turkestan and Siberia), a calcium-magnesium silicate. The presence of small quantities of other chemicals accounts for the wide range of shades. In China jade was for centuries the symbol of imperial authority; spiritual qualities have been ascribed to it, and it has been fashioned into ritual objects, also into miniature sculptures of animals or even whole landscapes, charming to look at and incredibly skilfully made.

The Chinese word for jade is *yü*, used as a symbol for all that is noble, beautiful and pure. The statue at the Jade Buddha Palace in China weighs 260 tons.

Jaguar, a South American carnivorous animal resembling the leopard, but larger and more powerful. It preys on other animals but rarely attacks humans.

January, the first month of the year, named after Janus, the two-faced god of the Romans. It was the *Wolf monath* and *Aefter Yule* of the Saxons.

Japanese knotweed, bamboo-like weed which can grow to 3m.in just 10 weeks. It spreads very quickly and can push through tarmac and concrete.

Jasmine, a graceful climber belonging to the olive family with odoriferous blossom, originally a Persian plant, but now acclimatised in many varieties in almost all parts of the world. Two species (the common jasmine and the Spanish jasmine) yield oils used in perfumery.

Jasper, a precious stone of the chalcedony variety, opaque, and coloured red, brown, yellow and sometimes green. It was greatly esteemed in classical times, the Bible having numerous allusions to it.

Jay, a gaily-coloured bird of the Crow family, of many species—the Blue jay of N. America, the Canada jay, sometimes called "whisky jack", the Siberian jay and the British jay, fawn-coloured with black and whitish crest and bright blue feathers in the wings. It lives in woods and like the magpie, takes the eggs and young of small nesting birds.

Jazz a rhythmical syncopated music characterised by a strong element of improvisation in the performance, *See* **Section P.**

Jean, a stout kind of twilled cotton cloth, resembling fustian. Blue jeans, adopted by American city youngsters from farmworkers, became the fashion elsewhere. Worn not only as overalls by workmen but by both sexes in leisure time.

Jellyfish. The jellyfishes, which have gelatinous, translucent bodies fringed at the margin with delicate tentacles, constitute the coelenterate order *Scyphozoa*. The mouth, with a squarish opening, is seen on the underside, and there are four horseshoe-shaped sex organs. They are 95 per cent water. There are over 2,000 species worldwide (but only *c*.70 are dangerous to humans). They are difficult to study in laboratories The number of jellyfish in UK waters is rising fast.

Jerboa, small jumping mammals of the Rodent order. These mice-like animals have long tufted tails and very long hind legs, the front legs not being used for locomotion. They are found in Africa, Asia *etc*.

Jerusalem Chamber, a room in Westminster Abbey, deriving its name from the circumstance of its having originally been decorated with a view of Jerusalem. Henry IV died in this chamber, and the Committee for the Revision of the Bible met there in 1870 and later.

Jesuits, members of the Roman Catholic religious order founded by Ignatius Loyola in 1540. A long and vigorous course of study is prescribed before they are admitted into the privileges of full membership. They are required to take the vows of voluntary poverty, perfect chastity, perfect obedience and complete submission to the Pope with regard to the Mission of the Order. Pope Paul VI gave them the particular mission of initiating a dialogue with atheists.

Jet, a deep black fossil substance admitting of a high polish and much used for jewellery, ornaments and trimming. It is a form of lignite, the most important British deposit being found near Whitby, where jet manufacture has been an established industry for a long period.

Jet Engine, an aeroplane engine which derives its thrust from the high velocity of the gases it ejects. The essential units in a jet engine are a rotary compressor and a gas turbine, the latter driving the compressor. The first reliable, high-performance jet propulsion engine for aircraft was invented by Sir Frank Whittle.

Jet Stream, a meteorological term coined in 1946 to describe the relatively narrow belt of strong winds (160–320 km/h) at levels in the atmosphere from 5–11 km. These winds are important in forecasting weather, and can be a valuable aid to aircraft.

From the ground, where there may be little wind, it can sometimes be seen as high cirrus cloud moving across the sky at high speed.

Jew's Harp. The name is believed to be a corruption of "jaws harp". This instrument consists of a metal frame with a central tongue of spring steel. The frame is pressed against the teeth, and the tongue of the harp is twanged with the finger, the mouth acting as a resonating chamber. By altering the shape of the mouth the resonant frequency and therefore the note can be varied.

Jockey Club, the governing body that, although possessing no legal status, frames rules and laws by which horse-racing and turf matters are regulated. The club-house is at Newmarket.

John Bull, the typical figure of an Englishman, bluff and burly. Arbuthnot's *History of John Bull* is supposed to have originated the character.

John Dory, a fish found in most temperate seas and common in British waters. It is of a golden-yellow colour (*jaune doré*), has a high dorsal fin with long filaments projecting from the spines, very protractile jaws and is much valued as a table fish. According to legend the dark spot on each side of its body is the thumbprint of St. Peter who took a coin from the fish's mouth.

John o' Groat's House, W. of Duncansby Head, Caithness, popularly named as the northernmost point of Scotland. According to legend the house, which has now disappeared, was built in octagonal form by a Dutchman Jan de Groot who came to live there in the 16th cent. The site is marked and an inn erected near it in 1876.

Jongleurs were minstrels and jesters who wandered from town to town singing songs, playing musical instruments, dancing and giving entertainments in medieval France and Norman England. Jongleurs were low-born in contrast to the Troubadours, who were often of the nobility.

Joule, a unit of energy in the SI system of units, defined as the work done when the point of application of a force of one newton is displaced through a distance of one metre in the direction of the force. Named after J. P. Joule (1818–89). The relationship between mechanical energy and heat energy is called the mechanical equivalent of heat. One British Thermal Unit (Btu) is equivalent to 778 ft.lb or 252 calories or $1{\cdot}054 \times 10^{10}$ ergs or, in SI units, 1054·35 joules. *See* **Section T.**

Julian Calendar, named after Julius Caesar, who in 45 B.C., finding the Roman year 90 days in advance of the real time, was the first to adopt the calculation of time by the solar year, the average length being fixed at 365¼ days. There was still an overplus of a few minutes every year, and this was rectified by the Gregorian Calendar, introduced in Italy in 1582 and adopted in England in 1752, from which date what is called the "New Style" begins.

July, the seventh month of the year, named after Julius Caesar. It was the *Maed monath* (Mead-month) of the Saxons.

June, the sixth month of the year, containing 30 days and deriving its name from Juno. It was the *Sear* (Dry) *monath* of the Saxons.

Juniper, one of only three native English conifers. A distinctive, sprawling evergreen only to be found on rocky soils in remote upland areas. Its berries are a main flavouring ingredient of gin but they are now being attacked by a deadly fungal disease.

Jupiter is the largest of the planets, 11 times the diameter of the earth, 318 times its mass but only one fourth its density. It is the fifth farthest from the sun and is the second brightest. Our knowledge of Jupiter, with its 67 known moons, its ring and its magnetosphere was greatly increased in 1979 by data from the Voyager 1 and 2 space-probes which passed the planet at distances of 349,000 km and 722,000 km on March 5 and July 9 respectively. Jupiter is a gaseous planet composed mainly of hydrogen and helium like the sun, possibly with a small molten core of silicates. The centre is presumed to be at a very high temperature (30,000°C) and enormous pressures—a hundred million earth atmospheres—which make hydrogen not only liquid but metallic. This metallic flux leads to intense magnetic fields. Jupiter's large magnetosphere is distorted by the solar wind and contains trapped high energy particles in radiation belts which would be lethal to man. Its existence was confirmed by Pioneer 11 in 1974.

It is now brown that Jupiter's huge magnetic field extends out to Saturn.

Jupiter's outer gaseous surface is very cold (−120°C) and consists of three layers of crystal clouds (ice ammonium hydrogensulphide and ammonia) interspersed with gaseous hydrogen and helium. It shows massive persistent features like the swirling high pressure Red Spot (larger when first seen in 1664 but which could hold two earths) and the neighbouring white oval formations. All these features are in relative motion, some moving east and others west which account for Jupiter's banded appearance. The persistence of the features arises because Jupiter has no terrain to break them up and because the surface temperature is low. Lightning continuously flashes over the Jovian surface and at the poles there are large auroras caused by an electric current of five million amperes which flows from the poles out to Io, one of the four moons discovered in 1610 by Galileo. The others were Europa, Ganymede and Callisto.

The fourteenth moon was found in 1979 by Voyager 2 at the outer edge of the thin ring of particles discovered by Voyager 1, which also discovered high plumes due to volcanic activity on Io, the first seen beyond earth (although a recent suggestion is that the plumes are caused by the electric current). Io's sulphurous surface shows no meteoric craters and Europa's smooth ice surface shows only a few impacts and is probably young, unlike the older Ganymede and Callisto whose ice-crust surfaces have many. Ganymede's crust has been reworked, however, by extensive tectonic movements. Ganymede is now known to be the largest moon in the solar system, larger than the planet Mercury. A total of 63 moons around Jupiter has now been discovered. In 1994, Jupiter was struck by the Shoemaker-Levy-9 comet whose impact sent seismic waves across the planet.

In 1995, the Hubble telescope found oxygen on Europa. Late in 1995 the Galileo spacecraft successfully entered the atmosphere of Jupiter. First data from Galileo suggested Jupiter's atmosphere was hotter and drier than expected with hurricane winds of 330 mph. Images from Galileo in 1997 appeared to show iceberg-like structures on Europa. The origin of Jupiter's swirling rings was discovered in 1998 to be the detritus thrown up by meteoroids crashing into the moons Amalthea, Thebe *etc*. Colour images of Io taken in January 2001 show great volcanic activity. The first pictures of Callisto (2001) showed jagged hills of ice and rock. The 14-year mission of Galileo ended in September 2003 when it crashed onto the surface of Jupiter. It had found volcanic activity on Io perhaps 100 times greater than on Earth.

Juno was launched on a 5-year unmanned journey to Jupiter in August 2011, arriving in 2016 after a long 1·74 million mile journey. Successfully flying just 2,500 miles above Jupiter's clouds, its mission was to study the planet's composition and gases and peer into its Great Red Spot. A mission to explore the moons of Jupiter (the Jupiter Icy Moons Explorer) is planned for 2022.

Jurassic Formation, a series of rocks (the evidences of which are most marked in the Jura Mountains) coming between the Cretaceous and Triassic groups and including the Oolite and the Lias. It is a formation rich in fauna, abounding in echinoids, lamellibranchs, ammonites and belemnites; large reptiles, marine and land, are common, as are the plants called cyads. In Britain the Jurassic outcrop extends from the Dorset coast to the Yorkshire moors.

Jury, a body of private citizens chosen and sworn to hear and pass verdict upon evidence brought forward at a trial, inquest or inquiry. The origin of the English jury is obscure but it is thought to have been introduced by the Normans. The jurors are the sole judges of the true facts upon the evidence laid before them.

Under the Criminal Justice Act of 1967 their verdicts in criminal courts in England and Wales no longer had to be unanimous but may be by a majority of 10 to 2. The age limit has been reduced from 21 to 18. The upper age limit has been raised to 75. Since 2004, judges, lawyers and peers have been eligible for jury service.

In Scotland 45 jurors are summoned in criminal cases, of whom 15 are chosen by ballot, and majority verdicts are accepted: not guilty, not proven and guilty. Proposals to limit the right to trial by jury (and scrap the double jeopardy rule) have attracted much criticism.

Justices of the Peace. *See* **Magistrates.**

Jute, the name given to the fibre of a plant grown largely in Bangladesh in the Ganges delta and used for the manufacture of coarse cloths, cordage and sacks. Kolkata (Calcutta) is the biggest jute-manufacturing centre of the world, as Dundee was in the 19th cent.

Jutes, a Low German race who in the 5th cent. invaded SE England, establishing themselves in Kent and making Canterbury their capital.

K

Kakapo, a slow-moving flightless parrot, once extremely common in New Zealand but since the 1950s very threatened. Also called owl parrots. The heaviest parrot species in the world. It is now the subject of an intense conservation project.

Kangaroo, pouched (marsupial) mammals of Australia and adjacent islands. There are over 20 species, the smaller ones being known as "wallabies". Kangaroos leap in a succession of springy bounds 3–6 m long, the forefeet not touching the ground. They can reach a height of over 2 m and a weight of 90 kg. First seen by white men when Capt. Cook's expedition visited Australia in 1770. Related genera include the tree kangaroos, rat kangaroos and the Tasmanian Jerboa kangaroo. There are an estimated 20 million kangaroos in Australia and their numbers are out of control. In New Guinea they have taken to the trees.

Kaolin or **China Clay** is an essential ingredient in hard-paste porcelain (*q.v.*). It results from the decomposition of felspar, and is widely found in China, Japan and the USA. The richest deposits in Europe are in Cornwall, near Limoges in France, and in the Czech and Slovak Republics. Today the largest use is in making glossy paper.

Kea, the Alpine parrot of New Zealand.

Kelvin. The measure of temperature on the absolute scale. The Kelvin scale is a development of the scale invented by Celsius (*q.v.*) for everyday use, long known as the "centigrade" scale; the degree interval on both scales is the same. The conversion formula for the Kelvin scale is $K = C + 273{\cdot}15$. *See* **Absolute Temperature.**

Kerguelen, the lost continent formed 110 million years ago which sank back beneath the present Indian Ocean 20 million years ago.

Kernewek. The native language of Cornwall which almost died out in 1777 (when the last native speaker died) but is now being revived. In 2002, Cornish was granted protection under the EU charter on "minority languages". A "standard" form of Cornish was agreed in 2008. Cornwall is now getting bilingual road signs. There are over 3,000 speakers worldwide (compared to 200 in 1985). Around 600 people speak Cornish as a main languge. The Bible was translated into Cornish in 2011. There are now Cornish-language rock bands. There are also calls for a Cornish Assembly.

Kestrel, the most common British falcon, well known for its habit of hovering for minutes at a time with vibrating wings and then swooping down to attack mice and insects. The male has spotted chestnut-brown back, greyish head and tail, with a broad black band near tip. Kestrel numbers are now rapidly declining.

Ketones. A class of organic compounds, related to aldehydes, of general formula R_2CO (where R is an organic radical). The simpler ketones, especially acetone, are widely used as solvents for lacquers, synthetic rubber and polymers, such as cellulose acetate and perspex. More complex ketones occur in nature, and some are used in the perfumery industry. Muscone (from the musk deer (*q.v.*)) is an example.

Kew Gardens, officially known as the Royal Botanic Gardens, are among the most celebrated gardens in the world. They were started in 1759 by Princess Augusta of Saxe-Gotha, widow of Frederick, Prince of Wales, and mother of George III. They remained private property until 1841, when control passed to the Commissioners of Woods and Forests. They now cover 326 acres and are run by an independent body under the 1983 National Heritage Act. Since 1841 the gardens have been open to the public. Now a World Heritage Site. They are home to the Millenium Seed Bank. Kew now publishes an annual "State of the World's Plants."

Keys, House of, is the Manx representative assembly. *See* **Tynwald.**

Khaki, a clay-coloured cloth adopted for uniforms in the British Army in the time of the war with the Boers, and used in the first and second world wars. First used by Indian regiments.

Kibbutz (Hebrew, gathering). Israeli collective farm.

Kilogram, unit of mass, defined as the mass of the international prototype kilogram of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. A remeasurement of Avogadro's Number (**T24**) may lead to an atomic standard of mass (the second and the metre are already defined in atomic terms), but this depends on the precision with which atoms can be counted. One kilogram equals 2·205 pounds.

Kilowatt. Unit of power. *See* **Watt.**

Kinetic Energy, the energy (*q.v.*) possessed by a particle or body in virtue of its motion. If the motion is destroyed, *e.g.*, by the impact of the body with an obstacle, the kinetic energy vanishes, being turned into some other form of energy such as heat and sound. If the body has mass m and speed v its kinetic energy (leaving out corrections due to relativity) is $\frac{1}{2}mv^2$.

King Crab, remarkable arthropods now classified separately from both Arachnids and Crustacea which they resemble, inhabiting the sea coasts of America, Japan, India and Malay Peninsula, carrying a shield-shaped shell, and having a long pointed spine projecting from the posterior.

The body comprises three separate sections articulated together. These crabs—in America known commonly as the horseshoe crab because of their shape—are from 45–60 cm in length. Fossil king crabs are found as far back as the Silurian. There are about six living species.

Kingfisher, a well-known family of brilliant-plumaged birds, found in all continents, comprising over 250 species and sub-species. The British kingfisher, *Aceldo atthis*, haunts the rivers and streams, and is one of the most beautiful of native birds, having iridescent blue-green, white and rich chestnut in its plumage and bright-red feet. All kingfishers have long, dagger-shaped bills. In the Malayan region, New Guinea, the Moluccas and Australia, the varieties are very numerous. The quaint *Laughing Jackass* of Australia is among the largest of the kingfisher family. The European kingfisher is the bird of the Greek legend of the Halcyon. Cleaner rivers and more sensible management of river banks are encouraging the kingfisher to return, but recently numbers have declined. Kingfishers must eat their own body-weight in fish every day.

King-of-Arms, the name of the chief officials of the Heralds' College. There are several in England —the principal are the Garter, Norroy and Ulster, Clarenceux. *See* **Heralds' College.**

Kirimon (*Kiri no go Mon*) and **Kikumon** (*Kiki no* *go Mon*), the two Japanese imperial crests, the first a design of leaves, stems and flowers of the Paulownia plant, and the other representing the sixteen-petalled chrysanthemum.

Kite, name of several birds of prey, widely distributed, related to the hawks and eagles, graceful in flight, and distinguished by their long wings and deeply forked tails. The red kite, light chestnut brown, once the most familiar bird of prey in Britain, seen scavenging the streets of London, became extinct. But since its reintroduction in 1989 it is threatening some songbird species. There are now *c.*3,000.

The Egyptian kite and the pariah kite of India, notorious for their thefts, are closely related to the black kite, a smaller European species, with less forked tail and blackish-brown plumage.

Kittiwake, a beautiful white and pearl-grey gull with black legs, dark eyes and greenish-yellow bill. Its range is wide, and includes the British Isles, where it is a local resident. The flight of this only truly oceanic gull, which except in the breeding-season is generally found offshore, is graceful, swift and buoyant. A triangular black patch, noticeable on the ends of the wings when open, is characteristic of the species, as is the call kitti-wake, from which the bird derives its name. It nests in colonies on the ledges of caves and steep cliffs. It is now struggling to survive in Britain.

Kiwi, flightless, stoutly-built birds of New Zealand now very rare. They are little larger than a domestic hen, and lay astonishingly large eggs for their size. Incubation and care of chicks fall to the male bird. They have rudimentary wings concealed by the plumage, and the feathers are hair-like. They are nocturnal. They are the only bird to have nostrils at the end of their beaks. They are the national emblem of New Zealand.

Knighthood In Britain the main orders of knighthood are those of the Garter, the Bath, the Thistle and St. Patrick; in addition to which there are several other orders, *e.g.* the Order of St. Michael and St. George. There are also Knights Bachelors not associated with any special order. The title is not hereditary, and ranks below that of a baronet, though both are entitled to the prefix "Sir".

Knights of Malta. *See* **Hospitallers, Knights.**

Knot, a nautical measure of speed (1 sea mile per hour), and formerly measured by a log-line, divided by knots at equal distances $\frac{1}{120}$ of a geographical mile. The number of knots travelled by the ship in a half a minute corresponded to the numbers of sea miles it travelled per hour. A sea mile is equal to about $1\frac{1}{6}$ of a statute mile or 1·9 km. Also, a grey and white wading bird, usually a winter visitor to Britain found in flocks on the coast.

Knotweed. *See* **Japanese knotweed.**

Knout, a whip of many thongs, often fatal in its effects, formerly used in Russia for flogging.

Koala, the Australian arboreal marsupial mammal that looks like a cute teddy-bear, with ashy-grey fur, bushy ears and rudimentary tail. It feeds on the leaves and shoots of certain eucalyptus trees, and is not more than 60 cm in length. Today fewer than 50,000 remain and their habitat is threatened. All the moisture they need comes from eucalyptus leaves. They suffer severely from stress. The new-born "joey" develops in its mother's pouch. Koalas sleep 19 hours a day! They hug trees to stop overheating. In 2012 Australia listed them as a threatened species.

Kohl, a powder prepared from antimony or burnt almond shells, and in common use by Asian women for darkening the eyelids.

Komodo Dragon. *See under* **Monitor.**

Kookaburra, an Australian bird distinguished by its unusual laughing sound.

Koto, a musical instrument in general use in Japan consisting of a series of 13 silken strings stretched across a curved wooden surface, and played with the fingers. It is a sort of horizontal harp.

Kremlin, the citadel or walled area within a Russian city which during the Middle Ages served as an administrative and religious centre and offered protection. That of Moscow contains the cathedral where the Tsars were crowned, an imperial palace and the "King of Bells" (*see* **Bells**). Its walls which are topped with towers were built in the 15th cent.

Krill, shrimp-like crustaceans at the heart of the food chain in the oceans. Their decline around Antarctica is threatening the eco-system.

Krypton, one of the rare gas elements, no. 36, symbol Kr, occurring in the air to the extent of 1 part in 20 million. It was discovered in 1898 by Ramsay and Travers. It is used in gas-filled electric lamps.

Kuiper Belt. A disc of many millions of comets that is formed on the plane of the solar system and lies 12–15 billion kms from the Sun. It includes Pluto.

Kumara. *See* **Sweet Potato.**

Kurds, an Indo-European people who have faced repeated oppression in Iraq and Turkey (and to a lesser extent in Iran and Syria). Kurdistan, the mountainous 'land of the Kurds', which has been their homeland for thousands of years, straddles the four countries just mentioned. Their religion is Sunni Muslim. They number around 34 million, the biggest ethnic group in the world with no state.

Iraq's northern Kurdish region has been autonomous since 1991. Kurds are currently battling Islamic extremists in this region, but are again being attacked by Turkey. In 2016 the Kurds of Iran resumed an armed struggle.

Kusti, the sacred cord or girdle of the Parsees, consisting of 72 threads—the number of the chapters of the *Yasna*—and two branches, each branch containing six knots, together standing for the 12 months of the year.

Kyrie Eleison ("Lord, have mercy"), the name of a common form of prayer in some Christian Churches; also applied to the English Church responses after the recital of the commandments.

L

Labradorite, a felspar rich in calcium and of a pearly lustre on cleavage, found in masses in igneous rocks. The best comes from Labrador.

Labyrinth, or **Maze,** a combination of roads and passages so constructed as to render it difficult for anyone ignorant of the clue to trace the way to the central part. The Egyptian labyrinth near Lake Moeris had 3,000 rooms, half of them below ground and the remainder above.

The labyrinth in Crete, according to Greek myth, was built by Daedalus to house the Minotaur. There was one at Lemnos, renowned for its stalactite columns; and another at Clusium built by Porsenna, King of Etruria, *c.*520 B.C.

The labyrinth in which Fair Rosamond was concealed was at Woodstock. Hampton Court maze dates from the 16th cent.

Labyrinthodonts, gigantic fossil amphibians which get their name from the curious labyrinthine structure of their teeth, probably an evolutionary link between fishes and reptiles. They occur in the Carboniferous, Permian and Triassic formations, and remains have been found in Britain and other parts of Europe.

Their heads were long, and their footprints closely resemble the prints of the human hand.

Lac, a resinous matter deposited on the branches of a number of tropical trees by the females of the lac insect, the exudation including eggs and a viscous covering. At the gathering time the twigs are broken off and dried in the sun, when the insects die, and the lac that remains is termed *stick-lac*. From this, by the removal of extraneous accretions and dissolving, *seed-lac* is produced.

Shell-lac is seed-lac after it has been melted and otherwise prepared, and this is the best known of the lacs, used in printing and making varnishes, sealing-wax *etc*.

Lace, a delicate fabric of linen, silk or cotton threads, made by hand or machinery, and worked in various ornamental designs. The kinds of lace are many, deriving their distinctive names either from the method employed in production or from the place where any special variety was originally made. The best-known makes are pillow or bobbin-lace, woven and plaited by hand; needle-point lace, worked by the needle over a traced design; and machine lace, which practically dates from Heathcote's invention of the early part of the 19th cent.

Some of the most famed laces are the following: *Alençon*, a needle-point lace; *Brussels*, a very fine kind, with needle-point sprigs and flowers;

Chantilly, a silk variety with flowers and openwork; *Cluny*, a netlace with darned stitch; *Honiton*, a delicate kind with dainty sprigs and figures; *Mechlin*, generally made in one piece and very varied in design; and *Valenciennes*, or bobbin lace, of great durability, the pattern and ground of which are made at the same time, being one of the best and most costly of laces, now manufactured mainly in Belgium. Nottingham was famous for its lace.

Lace-Wings, insects with frail, transparent and much-veined wings whose grubs eat large numbers of insect pests such as aphids. The eggs are borne at the ends of threads attached to plants.

Ladino, a hybrid language which mixed Hebrew and Spanish.

Ladybird, the common name of a large family of beetles—the *Coccinellidae*. The insect is usually of a red or yellow colour with small black or coloured spots. Ladybirds are of good service to the gardener because their larvae feed on aphids. The number of spots varies from 2 to 26. There are *c.* 2,000 species (42 found in Britain). There was an explosion in numbers in 1976. Now, they are under threat in Britain from a foreign invader, the Asian harlequin ladybird which arrived in 2004 and eats all our native species.

Lady-Day, the day of the festival of the Annunciation of the Virgin Mary, 25 March. One of the four English quarter days.

Lake Dwelling, the name given to certain prehistoric habitations which were thought to have stood on platforms over lakes, like villages in certain Pacific islands.

Lakes are bodies of water collected in depressions of the earth's surface. The most notable lakes are the Great Lake series of North America, including Superior, Michigan, Huron, Erie and Ontario, all discharging into the St. Lawrence River. Africa has an enormous area of lakes, including Mobutu Sese Soko and Victoria, forming the sources of the White Nile. Smaller lakes are numerous in other countries—Switzerland, Finland, Italy, England, Ireland, Scotland, all having their lake regions, where the scenery is invariably beautiful and romantic.

The Kariba Dam (Zimbabwe–Zambia border) and the Nasser (Egypt) are the largest man-made lakes in the world.

Many of the world's lakes are now diminishing because of global demand for water, but global warming could cause lakes in the Himalayas to burst their banks. Among lakes now in major decline are Lake Chad in Africa, Lake Balkash in central Asia and the Aral Sea.

Lake School, the name given, at first in ridicule, to a distinguished trio of poets—Wordsworth, Coleridge and Southey who made their homes in the English Lake District.

Lamellibranchs (**Pelecypods**), the class of aquatic, bi-valve molluscs to which the oysters, cockles, mussels, clams and scallops belong. In these animals the body, which is compressed laterally, is enclosed in two hinged shells held together by muscular action. The gills are thin plates hence the name "lamellibranchs".

Lamination, stratification on a very fine scale, as in shales.

Lammas Day is one of the oldest of the Church festivals, probably derived from the loaf-mass (*hlafmaesse*) of the Anglo-Saxons. It occurs on 1 August. It was formerly the day when loaves were given in place of first-fruit offerings and marked the transition from summer to autumn.

Lammergeyer, the bearded vulture of alpine regions, resembling an eagle in appearance. It has a white head with black tufts at base of the bill, and its general plumage is dark brown, nearly black. It is found in the remote mountain ranges from southern Spain and parts of Africa to China, and is becoming scarce. Its diet is 90% bone marrow.

Lampblack, a carboniferous pigment obtained from flame-smoke, and now produced in specially constructed furnaces in which bodies rich in carbon, such as tar, resin, petroleum, *etc.*, are burned. The smoke or soot resulting is collected from the sides of the furnace, and forms lampblack. It finds use in making printer's ink, black paint, *etc.* and in making dynamo brushes and arc-lamp carbons.

Lamprey. Eel-like fish having no scales, bones, paired fins or jaws. They attach themselves by their mouths to fish whose blood they suck. Together with the hagfishes, the lampreys are placed in a special class—the Cyclostomes. There are three British lampreys. Lamprey pie was once very popular. They are the world's oldest living vertebrate.

Lancelet. *See* **Amphioxus.**

Land Crab, a family of crabs (*Gecarcinidae*) which live mainly on land, though migrating to the seas to deposit their eggs.

Landrail, old word for Corncrake (*q.v.*).

Landslip, a sudden downward sliding under gravity of large masses of rock, soil, *etc.*; often set off by earthquake shock or saturation of a particular stratum with water. Many serious landslides have occurred from time to time. In 1618, an earthfall happened at Plurs, on Lake Como, involving the destruction of many buildings and the loss of numerous lives. In 1806 a portion of Rossberg mountain in Switzerland slipped from its position, and falling into the valley below buried many villages and hamlets and over 800 people. A chalk cliff 30–45 m high and 1·2 km long fell at Lyme Regis, in Dorset, in 1839, doing great damage. Over 200 people were killed by a landslip in Naini Tal, in India, in 1880; and at Quebec, in 1889, a rocky eminence called Cape Diamond gave way, buildings being destroyed and lives lost.

Notable landslips have occurred at Amalfi (Italy) in 1924, at Murchiston (New Zealand) in 1929, at Aberfan (Wales) in 1966, near St. Gervais (France) in 1970 and at Guinsaugon in the southern Philippines in 2006. *See also* tsunamis (**L110**).

Languages. Around 6,000 languages are spoken in the world today, but many are fast disappearing. The most widely-spoken are Chinese (all varieties), Spanish, English, Arabic and Hindi. *See also under* **Gaelic**, **Sanskrit**, **Aryan** *etc.*

Langue d'oc and Langue d'oïl, the two principal mediaeval French dialects, *oc* and *oïl* being their respective words for the affirmative particle (modern French *oui*). *Langue d'oc*, spoken south of the Loire, was the language of the troubadors. Provençal, one of its dialects had a literary revival in the 19th cent. under the influence of the poet Frédéric Mistral. *Langue d'oïl* was spoken in northern France, and it was the dialect of the Paris region, becoming into modern French.

Lantern Fly, bugs belonging to the family *Fulgoridae* in which the head is drawn out to form a lantern-like structure. In no instance is the "lantern" luminous as once thought.

Lanthanides, the fourteen metallic elements following lanthanum in the Periodic Table, *i.e.*, the elements cerium (no. 58) to lutetium (no. 71). They are also known as the rare-earth metals, though they are in fact all more terrestrially abundant than, for instance, mercury or arsenic (with the exception of the unstable radioactive element promethium, no. 61).

The lanthanides are distinguished by having an incomplete inner electron sub-shell (the 4f level), this feature giving them interesting magnetic properties. For instance, gadolinium, holmium and dysprosium are ferromagnetic at low temperatures. Chemically, the lanthanides behave similarly, being highly reactive metals usually forming trivalent salts. *See* **Periodic Table, T57.**

Lapis Lazuli, an azure-blue mineral, being a silicate of aluminium and sodium. The pigment ultramarine is made by grinding it, though artificial ultramarine has largely superseded it. The mineral (also called *lazurite*) has been used as a gemstone from antiquity.

Lapps. *See* **Sami, L96.**

Lapwing *or* **Green Plover,** familiar British bird on moors and marshlands with iridescent greenish-black plumage, white underparts and black crest. Often called the "peewit" from its cry. Protected since 1967. Once common, now special.

Larboard is the old nautical term indicating the left-hand side of a ship, and changed by Admiralty order to "port" in 1844. Starboard is the right-hand side.

Larch, a familiar coniferous tree in the mountain regions of northern Europe, and though not native to Britain, the Common Larch is successfully cultivated in various parts of the kingdom. It is one of the best of all turpentine-yielding trees, and the bark is valued for tanning. The larch is an unusual conifer in being deciduous.

Lark, a family of song birds (*Alaudidae*) of many species, some of which—notably the skylark—are famed for their habit of soaring into the air, singing all the while. They build their nests on the ground in the open country and, except for the black lark of Russia, have streaked brown plumage. The skylark and woodlark are the best known British species, while the crested lark and shore lark are among the occasional visitors. Africa has the greatest number of larks; America has only one species, the horned lark.

Larkspur, the common name of the genus *Delphinium*, a favourite flower introduced into British gardens from Switzerland in 1573. The common larkspur is *D. consolida*.

Larva, undeveloped form of any animal which before maturity undergoes metamorphosis, often different from the adult in structure and habits.

Laser. A remarkable kind of light source that was discovered in 1960. With the laser it is possible to probe the behaviour of matter under the influence of enormous energy densities, range and survey vast distances to microscopic accuracy and send millions of telephone and television messages between any two points that can see each other with telescopes. Laser light, in contrast to natural light, is coherent and can be expressed as a regular progression of waves carrying energy along a particular path.

The essential difference is that laser light is an orderly sort of wave motion in contrast to ordinary light which is inherently unsteady and thus an inefficient carrier of information in time.

The name *maser*, which is the microwave parent of the laser, derives from the expression "*m*icrowave *a*mplification by the *s*timulated *e*mission of *r*adiation". Upon application to light wavelengths the microwave part of the name lost its meaning and the term maser became generally descriptive of any device in which stimulated emission dominates.

Laser Fusion is a method by which it has been proposed that thermonuclear reactions may be controlled and exploited as a source of energy (*see* **Nuclear Fusion**). The idea is to irradiate a millimetre-sized pellet of a mixture of frozen deuterium and tritium with a short ($\sim 10^{-9}$ s) but very intense pulse of energy in the form of laser light. This has the effect of both compressing the pellet by a factor of at least a thousand and heating it to about 10^8 °C. Under these conditions, thermonuclear reactions (principally $^2D + {}^3T \rightarrow {}^4He + {}^1n$) proceed sufficiently fast that a net output of energy is obtained before the pellet explosively separates.

Formidable technical problems need solving before laser fusion can become a practical proposition. These include the development of efficient high-powered lasers and the design of a suitable reactor that can withstand up to 100 micro-hydrogen bomb explosions per second. It is still not clear whether this method of controlling nuclear fusion is more practical than the more conventional approach involving the magnetic confinement of plasmas.

Latent Heat is the quantity of heat required to convert 1 gram of a substance from one form into another. For example, when a solid changes into a liquid or a liquid into a gas, the addition of heat to bring about the change produces no rise in temperature, the energy being absorbed in the form of latent heat. An equal amount is released when the process is reversed. The latent heat of fusion of ice is about 79·6 calories per gram, that of the vaporisation of water about 539 calories per gram.

Lateran Councils were the religious conventions held in the Lateran basilica at Rome for deciding important questions of Church doctrine. The most brilliant was that of 1215.

Laterite refers to any tropical soil or soil horizon rich in hydrated ferric and aluminium oxides which harden when exposed to the atmosphere. It is difficult to cultivate and is commonly used for bricks and road metal. Laterite buildings have been known to withstand the weathering for many centuries and a number of fine examples are found in India and S.E. Asia.

Latitude of a point on the earth's surface is its angular distance from the equator, measured on the surface of the earth in degrees, minutes and seconds. Thus the equator is 0° Lat. and the poles 90° Lat. (N. or S.). First determined by Hipparchus of Nicaea about 160 B.C. Latitude introduces zones of climate, *e.g.*, tropical rain, subtropical steppe, temperate rain *etc.*

Laughing Gas. *See* **Nitrous Oxide.**

Launce *or* **Sand Eel,** a family of eel-like sea fishes found in large numbers on the coasts of North America and Europe. There are two species common to British waters. These fishes are of a bright silvery hue, and live much in the sand underneath the water. They are prized as food.

Laurentian Shield refers to the Pre-Cambrian rocks in the region of the Upper Lakes of Canada, nearly 5 million sq km in extent. Of enormous importance to Canada on account of the mineral wealth, forests yielding valuable timber and wood-pulp, and water-power.

Lava, the molten rock which is erupted from a volcanic vent or fissure. Also the same material which has cooled and solidified.

Lawn, very fine sun-bleached linen It used to be called "cloth of Rheims".

Lead, a soft malleable metallic element, no. 82, symbol Pb (Latin *plumbum*), occurring in numerous ores, which are easily smelted. Its most important source is the mineral galena which consists chiefly of lead sulphide; rarely is it found free. Lead is largely used in plumbing on account of its pliability, and in nuclear reactors as a shield against radiation because of its high density.

As an alloy element it combines in the formation of type metal, stereo metal, shot metal, pewter and many other compounds. Oxides of lead are used in some types of glass and in the manufacture of paints (red lead). All lead compounds are poisonous.

Leading producers of lead are the USA (Missouri), Australia (Broken Hill) and Russia. Britain was once a major centre of lead mining.

Leaf Miners, insect larvae which tunnel between the upper and lower skins of leaves. Most leaf miners are caterpillars of tiny moths; some sawfly larvae have the same habit.

Leap Year *or* **Bissextile,** was fixed by Julius Caesar, 45 B.C., the addition of one day in every four years bringing the measure of the calendar year even with the astronomical year with three minutes per year over. The Gregorian Calendar corrected this by dropping leap year at the centuries not divisible by 400. For instance, 1700, 1800 and 1900 were not leap years, but 1600 and 2000 were. The next will be 2400.

Leather was made in ancient Egypt, Greece and Rome, and has through succeeding centuries played an important part in the service of man. It consists of the dressed hides or skins of animals after the process of tanning has been gone through. Untanned skins are known as pelts.

Leather is classed either according to the skins from which it is made or the system of preparation employed. The best-known kinds are morocco, kid, Russian, chamois, Cordovan, grained, patent, russet, tan, calf and Hungarian.

Leech, an aquatic blood-sucking worm, mostly found in fresh-water ponds. Each end of the body is provided with a sucker, but that at the head end has jaws and teeth. There are 650 different species. The medicinal leech has three jaws. Used medicinally since the 6th cent. B.C. Leeches will not let go of their host until they are full, so removal has to be done carefully.

Leedsichthys, an extinct ancient fish, the largest the world has ever seen.

Leeward, a nautical term, meaning the sheltered side of a vessel—that is, the opposite side to that from which the wind is blowing.

Legion of Honour, the French order for distinguished services, military or civil, was instituted by Napoleon I in 1802, and confirmed and modified under later rules. There are five grades—Grands Croix, Grands Officiers, Commandeurs, Officiers and Chevaliers.

Legume, the fruit typical of the pea, bean family.

Lemming, small light-brown rodents with dark spots, now found only in Russia and Canada, about 12 cm long, with a short stump of a tail. The migrations of the lemming are famous, probably caused by overbreeding when food is plentiful. So insistent is the urge to keep moving that these animals will march on into the sea in their thousands and be drowned. Lemmings were around in Britain until *c.*8,000 B.C.

Lemur, almost the most primitive member of the primate order of mammals. They are noted for having strong pliant toes enabling them to use their feet as hands, and also well-developed thumbs on the hands. They have long squirrel-like tails, fox-shaped heads and large staring eyes. True lemurs are confined to Madagascar, which has *c* 100 types; closely related are the "bush-babies" of southern Africa. The Indri is the largest – and loudest – of the lemurs. The mouse lemur is the world's smallest primate. The Madagascan lemur is the most threatened primate group on earth as its forest habitat changes. Lemurs operate in a matriarchal society.

Lenses, pieces of transparent material designed to focus an image of an illuminated object. Usually of glass, but plastic lenses are common, and quartz, *etc.* are used for special purposes. The surfaces of the simplest lenses are parts of spheres. Lenses which are thickest, or thinnest, at the centre are called convex and concave respectively. Lenses of complex shape are often used in microscopes, *etc.* Electron lenses are arrangements of electric or magnetic fields which focus beams of electrons, *e.g.*, on to TV screens.

Lent, forty days' of fasting before Easter.

Leopard. *See* **Cat**.

Lepidoptera, order of insects with scaly wings and bodies, to which the butterflies and moths belong.

Leptons. A group of particles which include electrons, neutrinos and muons. All are much lighter than protons or any baryons (*q.v.*).

Lepus, the constellation of the Hare, situated under the Orion group, and one of the constellations with which the ancients were familiar.

Lewis, a contrivance for stone-lifting, the principle of which was known to the ancient Romans; it consists of two dovetail tenons of iron or other metal, expanded by an intervening key in a dovetail-shaped mortice in the stone, and shackled by a ringed bolt to the hoisting chain.

Leyden Jar, the earliest form of electrical condenser. Its invention is usually credited to Muschenbroeck of Leyden (1745). It consisted of a jar coated inside and out with tinfoil for about two-thirds of its height and having its inner coating connected with the top by a brass knob and chain. The jar was charged by connecting it to an electrostatic machine.

Lias, a geological term referring to the lower section of the Jurassic group, and mainly comprising shales and limestones.

Libraries, before the invention of printing, were few, and collected together at enormous cost. At Nineveh remains of libraries, consisting of tablets of baked clay, have been discovered. There were two libraries at Alexandria containing a vast collection of rolls or volumes, founded by Ptolemy I Soter (367–382 B.C.) and established by Ptolemy II Philadelphus (309–246 B.C.).

The great libraries of later times included the Vatican Library at Rome, moved to its present premises in 1588; the Royal Library in Paris which later became the Bibliothèque Nationale; The Astor Library, New York; and in England, the Bodleian Library, Oxford, and the British Library (*see below*). After 1850 public libraries were established in all the chief cities. The first lending library was opened in Edinburgh in 1726.

The British Library in London, the National Library of Scotland, in Edinburgh, that of Wales in Aberystwyth, the Bodleian Library of Oxford, Cambridge University Library and Trinity College Dublin comprise the "copyright" libraries, entitled to receive a copy of each new book and journal published in Britain (as well as every electronic publication). The British Library Act 1972 brought together into a single organisation (a) the former British Museum Library (the books remaining in the Museum) and the Science Reference Library in Holborn and Bayswater, the whole now being known as the British Library, Reference Division; (b) the former National Lending Library for Science and Technology and its arts and humanities counterpart, the National Central Library, together now known as the British Library, Lending Division and located at Boston Spa, Yorkshire. The new British Library has been granted Grade I listed status.

The major Reference Division, near Euston Station, was officially opened on 25 June 1998. Lending Division remains in Yorkshire. The British Library holds 14 million books on 390 miles of shelves.

Great emphasis is being placed on new developments in IT to transform libraries into a fully electronic network. Book borrowing is declining but Internet use of libraries is rising rapidly. On average, libraries now only spend 8·7 % of their overall expenditure on books. Current expenditure cuts are threatening many local libraries, but Europe's largest public library opened in Birmingham in 2013.

Libretto (It. booklet), the literary text of an opera or oratorio. Usually the composer and the librettist collaborate in the writing of an opera, but several composers (*e.g.*, Wagner) wrote their own librettos. Boito, librettist to Verdi for *Otello* and *Falstaff*, himself composed two operas *Mefistofele* and *Nerone*. Most famous of Italian opera librettists was the poet and dramatist Metastasio (1698–1782). His librettos were set to music by many composers.

Licence is a permission given to do some act, which without such permission, it would be unlawful to do. Licences are required for operating TVs (*see* **L106**), for driving a motor vehicle, for killing game, for setting up as a bookmaker, for selling beer, wines and spirits, tobacco, *etc.* and for importing certain items such as arms, ammunition, *etc.* The dog licence was abolished in 1988.

Lichens. In every lichen, two plants are associated, one being an alga and the other a fungus. The fungus derives its food from the alga; probably the alga gains too from the association, being protected against desiccation by the fungus (an example of symbiosis). Lichens are the first plants to colonise bare rocks.

Lido. Public open-air swimming pool, popular from the 1920s.

Lifeboats were invented by three men, Lionel Lukin who converted a coble into a boat for saving life in 1785; William Wouldhave, who discovered how to make a boat right herself if she capsized; and Henry Greathead, who built a lifeboat, partly from Wouldhave's model, in 1789. This boat was stationed at South Shields, although the earliest recorded reference to a lifeboat station was in 1770 at Formby, Lancs. It was not until 1851 that the first lifeboat able to self-right was built, and a motor was first installed in a lifeboat in 1904. Mersey class lifeboats, introduced in 1988, have twin turbo-charged diesel engines with maximum speed of 17·5 knots. Most coastal lifeboats in this country are maintained by the Royal National Lifeboat Institution founded by Sir William Hillary on 4 March 1824. It is supported entirely by voluntary contributions, and has saved over 137,000 people. Its headquarters are in Poole, Dorset. In 2017, its operating cost exceeded £410,000 each day of the year. There are 230 lifeboat stations around the UK and Ireland. The busiest is on the Thames in London. Since 1824, 778 lifeboat crewmen have died on rescue missions.

Life Expectancy. *See* **Longevity, L68.**

Light, a particular kind of electromagnetic disturbance capable of travelling through space, and some kinds of matter, and of affecting our eyes to cause vision. Its finite speed was first demonstrated by O. Römer, using observations of the eclipses of Jupiter's satellites in 1675.

In 1860 Maxwell showed that light waves are electromagnetic. Since Einstein's theory of relativity (1905) it has been generally realised that the speed of light is a fundamental natural constant. Visible light with wavelengths between about 4 and 7×10^{5} cm is only a small part of the electromagnetic spectrum. The speed of light in vacuum is *c.* $2{\cdot}997925 \times 10^8$ m/s. Scientists have now succeeded in "freezing" light (for a few hundredths of a millisecond) in an experiment that could help develop super-computers.

Light-Emitting Diodes (**LEDs**), the replacement for the traditional light bulb. They have no filament to burn out, but are not as popular as the old bulbs.

Light Year, a measure of astronomical distance, equal to the distance light travels in a period of one year. A light year is $9{\cdot}463 \times 10^{12}$ km. The unit parsec is now preferred. (1 pc = 3·2616 l.y.).

Lighthouses, to warn ships of dangerous places and indicate coasts, points, harbours, *etc.*, have existed since the building of the Pharos, a tower of white marble 183 m high, built by Ptolemy II Philadelphus at Alexandria about 283 B.C. In early lighthouses the lights were simple fires. The most famous and one of the earliest UK lighthouses is the Eddystone (*q.v.*).

The only surviving medieval lighthouse in Britain is St. Catherine's on the Isle of Wight.

The lighthouses of England and Wales, the Channel Islands and Gibraltar are under the control of Trinity House; Commissioners of Northern Lighthouses control those of Scotland; the Commissioners of Irish Lights control the coasts of Ireland. Particulars of lights in all parts of the world were published for the guidance of navigation in the *Admiralty Lists of Lights*. Under the 1987 Pilotage Act, responsibility for pilotage now rests with harbour authorities. All lighthouses are now automatic, the last manned lighthouse in Britain went over to computer control in 1998. Trinity House built its first lighthouse at Lowestoft in 1609. *See also* **Eddystone Lighthouse**.

Lightning, the flash of a discharge of electricity between two clouds, or between a cloud and the earth, when the strength of the electric fields becomes so great as to break down the resistance of the intervening air. With "forked" lightning the actual path, often branched, is visible, while with "sheet" lightning the flash is hidden by the clouds which themselves are illuminated. "Ball" lightning or fireballs is the name given to the luminous balls which have been seen floating in the air during a thunderstorm.

A flash consists of a number of separate strokes, usually four or five, and the discharge of electricity to earth begins with a faintly luminous "leader" moving downwards and branching at intervals. As the ground is approached a much brighter luminosity travels back along the conducting channels, lighting up with several branches. The multiple strokes which follow in fractions of a second have the same "return" nature and are rarely branched.

Lightning flashes to earth damage structures, cause loss of life and endanger overhead power systems, often interrupting electricity supply. Such storms generally affect radio transmissions and present hazards to aircraft. Thunderclouds may develop energy far exceeding that of our largest power generating stations.

Lightning occurs most frequently close to the Equator. It is rarer in cold climates. There are about four million lightning strikes each day across the world.

Megalightning is lightning that strikes from the clouds up into space and is thousands of times more powerful than conventional lightning.

Fear of lightning is called *astraphobia*.

Lightning Conductor, a metal rod, the upper part of which is of copper with a conical point, the lower portion being iron, which extends into the earth. Its effect is to gather to itself the surrounding electricity and discharge it into the earth, thus preventing its falling upon the protected building. In ships, lightning conductors are fixed to the masts and carried down through the ship's keel-sheathing. Benjamin Franklin was the first to realise the possibilities of lightning protection and, in 1752, carried out his famous experiment of drawing electricity from thunder-clouds, with the aid of a sharp- pointed conductor fixed to a kite.

Lillibulero, an old marching song arranged by Purcell. With words by Wharton, it is said to have "sung James II out of three kingdoms". Used by the wartime BBC as a station identification signal preceding news bulletins.

Lily Family (**Liliaceae**), one of the largest families of flowering plants, with 200 genera and 2,500 species. It includes the true lilies (*Lilium*), tulips and hyacinths. Vegetables belonging to the family are the onion and asparagus.

Limes, trees of the genus *Tilia,* including some 30 species spread over north temperate regions. The word is a corruption of "linden". Limes native to Britain are the small-leaved *T. cordata* and the broad-leaved *T. platyphyllos*.

The hybrid *T. vulgaris* was introduced into Britain from the Continent during the 17th cent. and is frequently seen in streets and parks. Lime-wood was used by Grinling Gibbons for his fruit, flower and bird decorations.

Limestones, sedimentary rocks composed wholly or largely of calcium carbonate and formed by two main processes, (1) organic (skeletal remains of organisms), *e.g.*, chalk (*q.v.*) and (2) chemical (precipitation of calcium carbonate), *e.g.*, oolite (*q.v.*). Marble is limestone that will polish after cutting.

Limpet, a primitive snail that lives attached to rocks. Their teeth are made of the strongest biological material we know of.

Lindisfarne Gospels. *See under* **Illuminated MSS** (**N9**).

Linear B, the mysterious language found on tablets in Knossos, Crete, in 1900.

Linen, a textile fabric manufactured from flax fibre, known to the ancient Egyptians, and first manufactured in England under Henry III by Flemish weavers. The greatest linen-manufacturing region in the world was Northern Ireland (largely yarns and the lighter types of fabrics); Scotland produced coarse linens and canvas as well as household linens.

Ling, a sea-fish common on the coasts of Britain, and abounding in more northern waters. It averages about 1 m in length, and is a voracious feeder, living chiefly on small fish. Ling is also the name applied to *Calluna vulgaris*, the plant commonly called "heather".

Linnean Society, famous society founded in 1788 to foster the study of natural history. Named after Carl Linnaeus.

Linseed, the seed of the flax plant, containing, apart from its fibrous substance, certain oily and nitrogenous matter of considerable commercial value. This yields linseed oil. Some of the residue is used to make cattle food.

Lion, the most impressive of the Cat family. It is chiefly found in open bush country in Africa. Asiatic lions are now only found in India. Its large square head, its flowing mane (in the males only) and its tufted tail distinguish it. Tip to tip it can reach a length of 3m; a weight of 225 kg. African lion numbers have now fallen to below 30,000, down from 200,000 in 25 years. Many are dying from Lentivirus, the lion form of AIDS.

Lions live in groups known as prides.

Lion and Unicorn, the supporting figures of the royal arms of Great Britain, date from the union of Scotland with England (1603) at the accession of James I (James VI of Scotland), the lion representing England and the unicorn Scotland.

Liquefied Natural Gas (**LNG**), gas which has been condensed into liquid, which reduces its volume to just 1/600th of its normal form, enabling it to be easily transported. Major storage facilities have been developed at Milford Haven.

Liqueurs are essences combined with alcoholic liquid, and are of many kinds, named according to their flavouring or place of production.

Liquid, the name given to matter in such state that it takes its shape from the containing vessel.

Liquid Crystals form a special class of substance and are true liquids in that they flow easily and can be poured. However, unlike ordinary liquids, liquid crystals have their molecules arranged with geometrical regularity in one or two dimensions, so that they have a certain internal structure similar to that of solid crystals. They are fairly complicated chemicals with somewhat elongated molecules. Liquid crystals are of interest to biologists as well as to chemists and physicists, and not just because they account for the iridescence of beetles. Some body fluids are in fact liquid crystals. There are also technological applications because of their unique electrical and optical properties.

Litanies were first used in church processions in the 5th cent. The first English litany was commanded to be recited by Henry VIII in 1544.

Lithium, a soft metallic element, no. 3, symbol Li, similar to sodium. It is very reactive and is stored under paraffin oil. It is the lightest metal element. The main sources are Bolivia, Chile and Australia. There has been a surge in demand for its use as a component of rechargeable batteries.

Litre, a metric measure, was abolished in 1964 as a scientific unit of volume, but remains as a special name for the cubic decimetre and as an everyday unit, *e.g.*, a litre of petrol.

Liturgy, the name given to the Church ritual, though strictly applying only to the portion used in the celebration of the Eucharist or Lord's Supper. The Anglican liturgy is laid down in the Book of Common Prayer (1662).

The Alternative Service Book dates from 1980. The new book of prayer, *Common Worship*, was introduced on 3 December 2000.

Liverworts (**Hepatics**), a class of simple green plants related to the mosses. Liverworts are most common in damp situations, such as the banks of ditches. The majority of British species are leafy, only some are thalloid.

Lizard, the name given to a diversified order of reptiles, of which there are *c.* 1,600 species. They include the geckos, chameleons, glass snakes *etc*. A previously unknown species of legless lizards was discovered in 2008 in the grasslands of Brazil. The lizard uses its tail to stabilise its body in mid-air.

Llama, mammals related to the camels, from which they differ in small size, absence of the humps, and more woolly coat. The domestic llama of S. America is used as a beast of burden, also providing wool, meat and milk. *See also* **Alpaca, Guanaco.**

Loadstone *or* **Lodestone,** an oxide of iron, found chiefly in Sweden and Norway. Its scientific name is magnetite. It has the power of attracting pieces of iron and served as the first magnets used in compasses. One of the class of non-metallic magnetic materials known as "ferrites" (*q.v.*).

Lobsters are marine crustacean animals existing in large numbers in the northern seas of Europe and America and in fair proportion on some British coasts (*e.g.* the Channel Islands).

Locust, insects of the grasshopper family, but much more powerful. They are inhabitants of hot countries, and often make their appearance in untold millions, like clouds, devastating all the vegetation that comes within their course.

The locust-tree (*Ceratonia siliqua*) is supposed to have furnished food to St. John the Baptist while in the wilderness, and its "beans" have accordingly been styled "St. John's Bread".

Loess, a deposit of silt or marl laid down by wind action. The biggest loess deposits are in Asia, the source of the dust of which they are composed probably being the deserts of Central Asia. Large deposits in Europe originated from the edge of ice sheets during the Ice Age.

Logarithms, a system of calculation invented by John Napier in 1614, and later developed by Henry Briggs. Thus if a number is expressed as the power of another number, *i.e.*, if $a = b^n$, then n is said to be the logarithm of a to base b, written logba. Common logs are to base 10 and Napierian to base 2·7182818 . . ., expressed as e.

Lombards, a German people, originating on the Elber, who settled in Italy in the 6th cent., occupying northern and central regions, and establishing a kingdom with Pavia as capital. They were conquered by Charlemagne in 774, but left their name to the region of Lombardy.

Lombard Street, London, takes its name from the Lombard merchants and bankers who came to settle there in the 12th cent.

London Clay, geological stratum which occupies much of the London Basin and part of the Hampshire Basin. It represents the lower stratum of the Eocene. Outside the metropolis, brickfields utilise the clay for brickmaking. Water held down in the Chalk by this impervious stratum is tapped by a number of artesian wells in London. The tunnels of the underground run through the London Clay.

London Eye, the "big wheel" by the Thames, nearly three times as high as Tower Bridge. The wheel can carry 15,000 visitors a day. The world's tallest Ferris wheel is now in Nanchang, China.

London University. Originated in the foundation of a non-sectarian college in Gower Street in 1828. Among the chief colleges are: UCL (University College London), King's College, (inc. former Chelsea College and Queen Elizabeth), Imperial College of Science and Technology, London School of Economics, School of Oriental and African Studies, Queen Mary, Birkbeck (founded in 1823 and specialising in part-time evening study), together with Royal Holloway. London University was the first to open all degrees to women (as from 1878). The London Institute became the University of the Arts in 2004.

London Zoo. *See* **Zoological Gardens, L118**.

Longevity. Life expectancy in Britain today is 78·8 for men and 82·8 for women. This compares to 48 and 51 back in 1906. This trend for a longer life-span is continuing in the United Kingdom. Every hour, life expectancy in Britain rises by another 16 minutes! There are now more pensioners than children in the UK and there are over 3 million people aged over 80. By 2061, around 26 % of our population will be over 65 (compared to *c.* 18 % in 2017).

Already Britain has the oldest population in the EU. Over 21 % of Britons are now over 60 and over 1·5 million are over 85 (compared to 200,000 in 1951). Britain had 14,500 centenarians in 2016 (compared to 2,500 in 1980).

The highest life expectancy in the world for women is currently Japan (86·0). For men, Iceland leads with 80·0. Japan comes second and Sweden third. Over a quarter of Japan's population is aged 65 or over.

The number of centenarians is also rapidly increasing. Living to over 100 will one day be routine (*e.g.* in Japan which will have 1 million centenarians in 2050). In Britain it is projected that 660,000 women and 541,000 men will be over 100 in 2074. By 2050, the world may have around 400 million people aged 80 or over.

The longest-lived person on record is Jeanne Louise Calment (of France) who died in 1997 aged 122 years and 164 days.

However, in contrast to this increasing longevity in developed countries, there are many low statistics for lifespan in Africa, Asia *etc.*

Longitude of a point on the earth's surface is the angle which the meridian through the poles and that point makes with some standard meridian. The meridian through Greenwich is usually accepted as the standard meridian and the longitude is measured east or west of that line. As the earth revolves through 360° in 24 h, 15° longitude represent 1 hour's difference in apparent time.

Lord Chamberlain. *See* **Chamberlain, Lord**.

Lord Chancellor. *See* **Chancellor, Lord**.

Lord Lieutenant is the Queen's representative in the county, and his office is now largely ceremonial. On his recommendation the magistrates or JPs are appointed by the Lord Chancellor. The office was created in 1549.

Louse, parasitic insect found on the skin of birds and mammals. The two sub-species that parasitise humans are the body louse and the head louse. Typhus can be transmitted by lice.

Louvre, one of the old royal palaces of Paris, was built in its present form partly by Francis I and added to by later monarchs, Louis XIV completing the edifice. Napoleon I turned it into a museum and enriched it with the plunder of many foreign art galleries.

The great extension to the Louvre building begun by Napoleon I was completed under Napoleon III in 1857. Much injury was done to the building during the Commune of 1871. Amongst other famous treasures it houses the Venus de Milo and Leonardo da Vinci's masterpiece, *La Gioconda*.

Lung Fishes. *See* **Dipnoi**.

Lutecium, element (no. 71) of the rare-earth metals discovered in 1907 by Urbain. Symbol Lu.

Lynx, cats of sturdy build, with tufted ears and spotted fur, inhabiting many parts of the world, including Northern and Central Europe. They can ravage sheep and goats.

Lyon King of Arms, the President of the Scottish Lyon Court, and head of the heraldic organisation for Scotland.

Lyre-Bird, a remarkable family of Australian birds, the males of which possess a beautiful lyre-shaped tail. The bird is not more than 38 cm long, but its tail, displayed during its remarkable courtship dance, is 58 cm in length. There are two species: the Superb and Albert's.

M

Macaque. A family of monkeys which includes the Barbary ape (specimens of which live on Gibraltar), the Rhesus macaque (the organ grinder's monkey and the one used for experimental work in the investigation of disease), the Bonnet monkey of southern India and Sri Lanka, the Crab-eating and the Pig-tailed monkeys of south-eastern Asia.

Macaw, a genus of large parrots with brilliant scarlet and sky-blue plumage, with interminglings of green. Native to South and Central America. Many species currently face extinction. They are the largest members of the parrot family.

Mace, originally a weapon of offence, now an ensign of authority borne before officers of state and other dignitaries. In the House of Commons the mace is handed to an official of the Crown by the Sergeant-at-Arms at the close of a session.

Mach Number. Unit of flight speed. The ratio of speed of flight to speed of sound under same conditions of pressure and density. Speed of sound at sea-level is 762 mile/h (1,226 km/h), so flight speed of 381 mile/h (613 km/h) is equivalent to a Mach Number of $\frac{1}{2}$. At supersonic speeds the Mach Number is greater than 1; subsonic speeds, less than 1.

Mackerel, a sea-fish existing in large numbers in the northern Atlantic off America and Europe.

They are beautiful fish with a streamlined body and among the fastest fish in the sea. Caution is needed that they are not over-fished.

Macromolecules are very large molecules about 10,000 times or more as heavy as ordinary small molecules like hydrogen. Most are built up from a large number of simple sub-units, *i.e.*, are polymers (*q.v.*). The term macromolecule is often used in biology, *e.g.*, starch and cellulose are biological macromolecules, both built from glucose sub-units. Other important ones are proteins and nucleic acids. The properties of macromolecules depend on the sub-units of which they are composed.

Mad Cow Disease, the common name for Bovine Spongiform Encephalopathy (BSE), a fatal brain disease in cattle. Concern resurfaced in 1996 over possible links with the brain disorder variant Creutzfeldt-Jakob disease (vCJD) which had begun to claim human lives. The Government admitted that it was possible that mad cow disease might be passed to humans by eating beef. Selective culling of cattle was begun.

Renewed concerns about long-term health risks to humans led the government to impose a ban on the sale of all cuts of beef off the bone in 1997. The EU ban on British beef exports was lifted in 2006. Over 183,000 cases of BSE have been confirmed in the UK since 1986. It has now almost died out amongst the world's cattle but a new case was reported in America in 2012.

Madder, one of the most important of dye-stuffs, largely used in producing Turkey-red dye, but now superseded by synthetic alizarin. Natural madder is the root of the *Rubia tinctorum*.

Maelstrom, a great whirlpool. The most famous is that off the coast of Norway, between the islands of Moskenës and Mosken, of the Lofoten group.

Mafia. A term which is connected with Italo- American organised serious crime. Historically, remoteness from the central government of Italy encouraged the growth in Sicily in the 19th century of *mafiosi*, key men who gained power through fear and violence.

Emigration of vast numbers of southern Italians to the United States led to a new type of urban *mafioso* who became connected with gangsterism and vice.

Sometimes called the *Cosa Nostra*, the organisation has infiltrated city governments and is reputed to be in control of drug smuggling and other illegal operations. Organisations of gangsters similar to the Mafia are thriving.

Magellanic Clouds, two small irregular galaxies that are close neighbours to our own Galaxy, first recorded in 1519 by Ferdinand Magellan. Both clouds are visible, with the naked eye, from the southern hemisphere. The Large Magellanic Cloud is 163,000 light years away and the Small Magellanic Cloud is 195,000 light years.

Magenta, a blue-red aniline dye discovered in 1859 by Sir W. H. Perkin, and named after the battle of that year between the French and Austrians.

Magic. *See* **Section J.**

Magic Circle, the world's most famous magical society. Its motto is *Indocilis Privata Loqui* which means "not apt to disclose secrets". This prestigious institution was established in 1905.

Magistrates *or* **Justices of the Peace** preside over petty sessional and Youth Courts *etc.* and are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County.

Most JPs are laymen and unpaid. In certain big towns a legally-qualified, paid, full-time magistrate is appointed, known as a stipendiary magistrate. In London stipendiaries are known as Metropolitan Stipendiary Magistrates. JPs are no longer appointed over the age of 60 and they must retire when they reach 70. The judicial office of JP derives from a statute of 1361. Magistrates, though mostly laymen and unpaid, are now subject to compulsory training but they remain overwhelmingly white and middle-aged.

Magma, molten rock material rich in volatile constituents prior to its eruption at the surface. With the loss of volatiles it becomes lava.

Magnesium, a metallic element, no. 12, symbol Mg, first isolated in 1808 by Sir Humphry Davy, who prepared it by electrolysing the chloride. Its chief ores are magnesite and dolomite. Industrially it is obtained by electrolysis. Many important light alloys contain magnesium. The metal burns with a very bright light, and for this reason it is used in photographers' flash bulbs and also in firework manufacture.

Magnetic Navigation. The ability of some creatures as varied as salmon and monarch butterflies, to navigate by means of a protein bundle buried in their cells.

Magnetic Storms. These are the effects of magnetospheric storms observed world-wide at ground level as fluctuations of as much as 5% in the earth's magnetic field. These are especially prevalent during sunspot maximums – a time when the sun is more active. The largest effects are observed at high latitudes, in the auroral ovals, and are due to electric currents flowing in the ionosphere and between the ionosphere and the magnetosphere. There may be concurrent disruption of radio communications. *See* **Magnetosphere** and **Aurora Polaris.**

Magnetism, originally the name given to the quality of attraction for iron possessed by lodestone (*q.v.*). Now known to be a phenomenon inseparably connected with electricity. Strong magnetic attraction is possessed by a comparatively small class of substances; iron, nickel and cobalt are the most common, but some are less well known, *e.g.*, gadolinium.

Many alloys have valuable magnetic properties which make possible numberless technical devices. New magnetic substances are being developed (*see* **Ferrites**).

The earth itself acts like a huge magnet with its axis inclined at about 11° to the axis of rotation, the magnetic poles being on the Boothia Peninsula (North Canada) and South Victoria Land (Antarctica). The magnetic field at the surface consists of the regular field of a magnetised sphere with an irregular field superimposed upon it. Variation in the magnetic forces occurs from place to place and from time to time, and maps showing the distribution over the globe of points of the same declination (*i.e.*, the angle which the magnetic meridian makes with the geographical one) are of the utmost importance in navigation. Little is known regarding the origin of the main (regular) field of the earth, but it is believed that the irregularities are due to the presence of intense electric currents in the upper atmosphere and local magnetisation of rock strata. It is now known that Earth's magnetic field is *c.* 4 billion years old.

In 1967 the discovery was made of isolated magnetic poles, *i.e.*, north and south magnetic poles existing separately, just as positive and negative electrical charges exist separately.

This discovery ranked as one of the great experimental results of the 20th cent., because of its significance for the theory of electromagnetism and fundamental particles. Magnetic field strengths are measured in gauss (cgs) or tesla (SI) units.

Scientists have now discovered that the magnetic field surrounding the Earth (protecting us from harmful radiation) is fast weakening.

The gradual shifts in the location of the north and south magnetic poles are known as *secular variations*. A complete reversal of the north and south poles may eventually occur.

Magnetohydro-dynamics. A current-carrying wire always experiences a force if it is in a magnetic field. This is the well-known electrodynamic force, and electric motors work because of it. If the current is carried in a fluid, *e.g.*, a liquid metal or a plasma, these forces cause bodily movements to the fluid, which are in general very difficult to calculate. The forces are then called *magnetohydro-dynamic forces*. Now magnetic fields are themselves produced by electric currents; so a current flowing in a fluid produces a magnetic field, which then reacts on the fluid itself by means of the magnetohydrodynamic forces. In the Harwell machine Zeta, which was used to study technical problems of thermonuclear reactions, this effect acted so as to constrict the electric discharge on to the axis of the tube and thus keeps it away from the walls. This action was assisted by an extra magnetic field produced by a separate current flowing in metallic conductors outside the tube. Thus the hot plasma was contained by magnetohydro-dynamic forces and not at all by the material tube wall. In practical devices of the future magnetic forces may have to sustain plasma pressure of 60 atmospheres—a pressure for which a thick steel wall would normally be used! *See also* **Plasma Physics.**

Magnetosphere. The magnetic field of the earth prevents the plasma of the solar wind from directly impinging on the earth's upper atmosphere and ionosphere. The cavity thus maintained within the solar wind is known as the magnetosphere. The tenuous plasma within this cavity is partly of solar and partly of terrestrial origin, from the solar wind and the ionosphere respectively. These plasmas are subject to large perturbations, known as magnetospheric storms, triggered by fluctuations within the solar wind. These storms generate intense auroral displays, magnetic field fluctuations at ground level, and often major disturbances of the upper atmosphere and ionosphere which may result in disruption of radio communications. The inner parts of the magnetosphere contain the Van Allen radiation belts (*q.v.*). On the sunward side the magnetosphere extends to between 12 and 20 earth radii.

However, on the side of the earth away from the sun it extends, like a comet tail, for many millions of km. Jupiter's large magnetic field produces a large magnetosphere, one of the largest features in our planetary system being as large as the Sun itself. The magnetic field of Mars vanished about 4 billion years ago.

Magnitude in astronomy is a measure of the apparent brightness of a star, which is inversely proportional to the square of its distance. A low number indicates a bright star, and a high one a faint star. The *absolute magnitude* is a measure of *real* brightness, *i.e.*, the brightness a star would have at a standard distance away of 10 parsecs (32·6 light years). The distance can be calculated if the apparent and absolute magnitudes are known. Another magnitude system used by astronomers is bolometric magnitude, which is a measure of the total radiation emitted by a star at all wavelengths. *See* **Light Year** and **Parsec**.

Magnum, equivalent to 2 bottles of champagne. A jeroboam is four.

Magpie, a well-known bird of the crow family, of glossy black and white plumage, famed for its intelligence and mischievous propensities. Now scientists have found that magpies are wary of shiny objects–contrary to folklore.

Magyars, the Hungarian race who came to eastern Europe from S.W. Asia and settled in Hungary in the 10th cent. Their language belongs to the Finno-Ugrian group.

Maidenhair Tree *or* **Ginkgo.** This tree takes its name from the shape of its leaves, which resemble those of the maidenhair fern. Widely cultivated in China and Japan. It is the only survivor of an order of gymnosperms which flourished in Mesozoic times. Botanically interesting because the male gametes are motile. It is the national tree of China and can survive for 1,000 years. Its DNA was decoded in 2016.

Makar. The national poet of Scotland. The current makar is Jackie Kay. Previous holders are Edwin Morgan and Liz Lochhead.

Mallard. *See under* **Duck**.

Malmaison, château at Rueil-Malmaison, a western suburb of Paris. It derives its name from having been inhabited in the 11th cent. by the Norman brigand Odon, and afterwards, according to the tradition, by evil spirits, exorcised by the monks of St. Denis. It was the residence of Napoleon and of the Empress Josephine after her divorce. She died there in 1814. In 1900 it was given to the nation.

Mammoth, extinct elephants of gigantic size. In 1799 the first perfectly preserved specimen was found in Siberia in a block of ice. It was in prehistoric times found in Britain and other parts of Europe, as well as in Asia and America. The extinction of the mammoth is now known to have been a gradual process, possibly aided by the replacement of nutritious herbs by grass. Scientists have uncovered the complete genome of the woolly mammoth. The age of mammoths can be worked out from their tusks.

Mammoth Cave of Kentucky, one of the largest known limestone caverns in the world, with subterranean passages at different levels, lakes and rivers (the Echo R. flows 110 m below the surface); stalactites and stalagmites abound.

Manatee, an aquatic mammal of the sea cow (Sirenia) order of mammals, averaging when full grown from 3–3·6 m in length, with shovelshaped tail, and forelimbs and nails which almost give the appearance of arms and hands. Gentle and trusting (and very slow) they are under threat from humans. Protected in Florida. In spite of their ungainly aspect, they are linked to the legend of mermaids.

Mandarin, the name given to a powerful Chinese official, civil or military, under the old régime, whose rank was shown by the wearing of a button on the cap. Mandarin is also the official language of China, spoken by most of the 1·3 billion people.

Manga, term for a wide range of Japanese comics (graphic books).

Manganese, a metallic element, no. 25, symbol Mn, discovered by Scheele, 1774. It is white-grey, not very hard (it forms a hard alloy with carbon), brittle, and tarnishes when exposed to air. Its chief ore is pyrolusite (manganese dioxide). Steels containing manganese are very tough. Manganese added to glass makes it clear or violet-coloured.

Mangosteen, a tropical evergreen tree from Indonesia.

Mangroves provide a natural breakwater. Their tangled roots can live in salt water. Mangrove forests are highly endangered habitats because of warming seas. The largest in the world is found in the Sundarbans in India.

Maniple, eucharistic vestment worn over left arm.

Manna, a tree of the ash genus, *Fraxinus ornus*, growing in the South of Europe and in the East and exuding a sweet substance which is gathered, boiled and eaten.

Manometer, instrument used to measure gas pressure. Usually a 7-tube containing water or mercury, one end open to the atmosphere, the other to the gas whose pressure is to be measured. More sensitive for small pressures than the Bourdon gauge.

Mansion House, the official residence of the Lord Mayor of London, stands opposite to the Bank of England, and was erected in 1739–53 from the designs of George Dance.

Mantis. Large insects belonging to the same order as the locusts and grasshoppers. The manner in which the forelegs are held, as though in suppliance, has gained for these insects the common name of "praying mantis".

Manx, Celtic dialect (Manx Gaelic) of the Isle of Man. The last surviving native speaker died in 1974.

Maoris, the race living in New Zealand at the time it was first visited by Captain Cook in 1769. They are believed to have migrated from Polynesia about 1350. Up to 1871 they were frequently in arms against the European settlers but their high intelligence and stamina enabled them to adapt themselves and the New Zealand laws have encouraged equal citizenship. They now number over 630,000. In 1994 Maoris in the upper North Island were offered land and money in compensation for land seized unjustly in the 19th century.

Maple, trees native to the northern hemisphere. There are over 100 species. The sycamore is the best-known species growing in Britain. The sugar maple abounds in Canada and the eastern parts of the United States. The sugar is tapped by boring holes in the tree in February and March, and the juice that escapes is collected and evaporated. The maple-leaf is the Canadian national emblem.

Mappa Mundi, the world-famous medieval map of the world, now housed in Hereford Cathedral.

Mara. The giant guinea pig of Patagonia which hops like an antelope.

Marathon, first run by Pheidippides from Marathon to Athens in 490 B.C. to announce the Greek victory over the Persians. The modern marathon is 26 miles 385 yards.

Marble is limestone in its hardest and most crystalline form. There are many varieties—33 were used in the building of the Paris Opera House— but white is the purest and rarest. White marble was used by the ancient Greeks for their temples and statues. Among the famous marbles of Italy are the Carrara and Siena marbles. Devonshire and Derbyshire yield some beautiful marbles and Connemara furnishes a serpentine-marble.

March, the third month of the year, and the first of the old Roman Calendar. It was named after the god Mars, and was the *Hlyd* (storm) *monath* of the Anglo-Saxons.

Mardi Gras, the last day of the Carnival in Trinidad, New Orleans, Rio *etc*, (Shrove Tuesday).

Mariner's Compass. *See* **Compass**.

Marionettes are puppets moved by strings. They originated in the *Fantoccini* of the 15th cent. which had such a vogue in Italy. The English *Punch and Judy* is a version of Punchinello.

Marmoset, small monkeys confined to the New World. Very squirrel-like in appearance, with long bushy tails, and thick woolly fur, they are pretty little animals and the smallest of all monkeys. There are claws, not nails, on their digits, the big toe excepted.

Marquess *or* **Marquis,** title next in precedent to that of duke. The first English marquess was Rovery de Vere, Earl of Oxford, so honoured in 1385.

Mars, the fourth nearest planet to the sun. The enormous amount of new information from the pioneer visits to Mars, primarily by the US *Mariner* and *Viking* spacecraft, back in 1971 and 1976 respectively, revolutionised our understanding of the planet. These missions showed that the planet's surface displayed many contrasts—the ancient crated terrains glimpsed previously, enormous volcanos, far larger than any on earth, vast wastelands, particularly near the polar regions, scoured by wind-blown dust over many aeons, and most tantalising, in many regions water had set unmistakable marks.

We see the plains which have been subject to great deluges of rain in, probably, a number of different episodes over hundreds of millions of years. Other regions, extending over hundreds of km, show great gorges and canyons cut by catastrophic floods, when some natural dam has burst, releasing the pent-up waters of a gigantic lake or sea. This pictorial evidence, and more detailed information from the *Viking* spacecraft tell us that its climate was once quite different from that observed today. The atmosphere, if only for brief interludes, must have been much denser, and warmer, and rain must have been able to fall.

Mars today seems too cold and dry for water but there are polar ice caps, and the nature of the meteoric craters suggests that the surface is rock over ice and solid carbon dioxide. Evidence continues to mount that a deep ocean once covered a third of the Martian surface. The search for life carried out by *Viking* produced much new information, but no traces of organic compounds as evidence, or precursors, of life.

Mars has two small moons, Phobos and Deimos, each believed to be captured asteroids. Early findings from the Mars *Pathfinder* mission (which landed on Mars in 1997) suggest there was abundant water in the past and also that Mars may be much more like Earth than previously thought. In 2001 the *Odyssey* probe entered into Martian orbit after a 285-million mile journey from Earth. Its mission was to scour the planet for signs of life. Its evidence of underground ice reservoirs at the South Pole was subsequently confirmed after 2003 by Europe's *Mars Express*. Mars clearly has water. It may even have been the 'Blue Planet' three billion years ago.

The ambitious Mars Science Laboratory (popularly known as Curiosity) was launched in October 2011. After 36 weeks, flying 352 million miles, it landed in August 2012. Curiosity is the largest extraterrestrial rover ever built. It is designed to search for signs of past life and has already found proof of early rivers on Mars. It has also detected burps of methane, maybe produced by bacteria. In 2015, streaks of salty water were detected flowing in the summer seasons. The Maven project, to study the planet's upper atmosphere, went into orbit in 2014.

Several new scientific projects (such as Orion) are planned to further our knowledge of the planet. China plans a mission in 2020. Manned missions in the 2030s are being planned by NASA.

Marseillaise, the French national hymn, written and composed by Rouget de L'Isle, a French engineer officer, who was inspired to write it in 1792 to encourage the Strasburg conscripts. It immediately became popular, and received its name because it was sung by the Marseillaise troops while marching into Paris.

Marshalsea, a former prison in Southwark, London, closed 1849. It existed as early as Edward III's time and was used as a jail for royal servants convicted of offences. In its later days it became a debtors' prison. Dickens described it in *Little Dorrit*.

Marsupials, members of the order of pouched mammals. Except for the opossums of America, all marsupials occur in Australasia, and include kangaroos, wallabies and wombats. Scientists now believe they first originated in China.

Marten, carnivorous animals of the weasel family; one species (the Pine Marten) was once common in Britain. Now it is returning in remoter areas. Most famous for their fur are the Siberian Sable and the American Marten.

Martial Arts, a term for such forms of combat as jujitsu, judo, kendo, kenjutsu and karate (which uses punches, knees and kicks to take out a foe).

Martin, a well-known bird-visitor to Britain. It belongs to the swallow family, and the two species that spend their summers here are the house-martin, which makes its nest of mud under the eaves of houses, and the sand martin, which builds in sandy banks.

Martinmas *or* **St. Martin's Day,** falls on 11 November, and is one of the Scottish quarter days. St. Martin was a very popular Saint with our ancestors. It was the important date when "Martlemas Beef" was dried in the chimney, and enough bacon and mutton cured to last until the spring. This diet of dried meat without vegetables caused scurvy. A late spell of fine weather at Martinmas is called St. Martin's Summer.

Martyrs. People who suffer death in testimony to their faith. Stephen (Acts 6; 7) was the first Christian martyr in 39. Historical tradition maintains that both St. Peter and St. Paul were martyred in Rome.

Mason-Dixon Line, the boundary line between Pennsylvania and Maryland, for long a source of dispute, drawn up by two English surveyors, Charles Mason and Jeremiah Dixon, between 1763 and 1767. It came to designate the boundary dividing the slave states from the free states of America, and is still used in distinguishing the "North" from the "South".

Masques were light dramatic compositions set to music and performed on special occasions. One famous example is Milton's "Comus", which was given at Ludlow Castle in 1634.

Mass, the service in the Roman Catholic Church defined as the Propitiary Sacrifice of Calvary, reoffered by the Priest acting *in persona Christi*. It was first celebrated in Latin in the 4th cent., and was introduced into England in the 7th cent. The use of a vernacular language was sanctioned by the 2nd Vatican Council (1965).

Mass Spectrograph, an instrument for separating isotopes. It works by sorting electrified particles according to their masses; the particles stream through a magnetic and possibly an electric field, and the lightest particles undergo the greatest deflection. *See* **Spectograph.**

Mast, a long round piece of timber or tubular steel or iron, standing upright in a vessel, and supporting the yards, sails and rigging in general. The earliest ships had only one mast, carrying a simple sail. The number increased until there were 4 or 5, or even more. Above the lower mast of a sailing-ship comes the topmast, and above that, the topgallantmast and royalmast.

The position of each mast is indicated by a prefix, as foremast, foreroyalmast, mainmast, *etc*.

The foremast is in the fore of the ship, the mainmast in the centre and the mizzen nearest the stern. In large vessels nowadays the mast does not extend to the keel, as it formerly did, but is usually stopped at the second deck.

Master of the Revels a former Court official upon whom devolved the arrangement of Court festivities. The office is at least as old as the time of Edward III. By 1737 it seems to have died.

Master of the Rolls, one of the senior English judges, since 1881 a judge of the Court of Appeal only. He has charge of the rolls or records of Chancery and ranks next to the Lord Chancellor and Lord Chief Justice.

Mastodon, an extinct order of quadruped closely resembling the elephant, but larger.

Materials Science is a blend of science and technology; it is the use of scientific research methods to study and improve materials for practical use.

Mathematics is a body of knowledge expressed in a language of symbols. *Pure* mathematics studies the propositions that can be deduced in this language by applying definite rules of reasoning to sets of axioms. In *Applied* mathematics, the mathematical language is used, often with great effect, to discuss problems of the real world, such as mechanics, statistics and science generally.

Matins, the first of the services of the day in the Roman Catholic Church and Morning Prayer in the Anglican Church. The daily service in the Roman breviary (*q.v.*) used to consist of eight offices or "hours", fixed by canon, for prayer and devotion but since the second Vatican Council the structure has been simplified. Formerly, Matins was recited or sung at midnight, Lauds at sunrise, Prime at 6 a.m., Terce at 9 a.m., Sext at midday, Nones at 3 p.m., Vespers at sunset and Compline before retiring for the night. Lauds are now commonly joined to Matins.

Matrix, a rectangular array of numbers considered as a single mathematical object. There are special rules for multiplying and adding matrices and they are often used in mathematics, physics and elsewhere to simplify calculations and as a notational device.

Maundy Thursday, the day before Good Friday, commemorates the Last Supper. "Maundy" derives from Christ's command (mandatum) to his disciples on that day to love one another. For many centuries the sovereigns of England, through their almoners, have distributed money, food and clothing to "as many old men and as many old women as the Sovereign is years of age". This ceremony is still observed, maundy coins being struck from standard silver.

Mausoleum, a special place of sepulture, generally for the reception of the remains of members of a royal or other family of distinction. The name is derived from the tomb of King Mausolus at Halicarnassus, erected 352 B.C., and forming one of the seven wonders of the ancient world. Another mausoleum is that of Hadrian in Rome.

Mauve, a colouring matter produced from lichens by Dr. Stenhouse in 1848, but in 1856 obtained from aniline by William Perkin (1838–1907), who gave it the name Mauveen. This was the first synthetic organic dyestuff ever to be produced, which led to the building up of the great synthetic dyestuffs industry (which Germany dominated before the first world war).

May, the fifth month of the year, but the third of the ancient Roman calendar. Supposed to be named after Maia, the mother of Mercury, to whom sacrifices were offered on the first day of this month. In England May Day was once the occasion of many festivities, including the crowning of the May Queen.

Maya, a civilisation centred on Guatemala, Belize, Honduras *etc.* which peaked *c.* A.D. 300–900. The Copan Ruins, the birthplace of the great Mayan civilisation, is a UNESCO World Heritage Site. A prolonged drought may have destroyed its empire. Hundreds of ancient Mayan cities have been located.

The Mayan Calendar began in 3,114 B.C..

May Fly. *See* **Ephemoptera.**

Mazarin Bible, an edition of the Latin Vulgate, acknowledged as the masterpiece of the Gutenberg press (1456). It was the first book completely printed from movable types. The first copy to capture the attention of scholars was found in the library of Cardinal Mazarin, in Paris. Also called the Gutenberg or the 42-line Bible.

Maze. *See* **Labyrinth.**

Mead, a fermented honey drink. Its earliest orgins have been traced to *c.* 7,000 B.C. in China. It features prominently in Norse mythology. Often drunk at weddings, hence the term honeymoon

Mean. In statistics and mathematics generally understood to be the arithmetic mean. The geometric mean between two quantities is the square root of their product. *See* **Average.**

Mechanical Equivalent of Heat. *See* **Joule.**

Medals, as decorations for military service, were first issued in this country by Charles I, who ordered medals for gallantry to be distributed to certain soldiers in 1643. Medals were also issued to officers and men who were victorious against the Dutch fleet in 1653. After Lord Howe's victory in 1794 a naval medal was instituted. Medals were also struck for the victory of Waterloo and for most later wars.

The Victoria Cross, a special reward for personal gallantry, was instituted in 1856. The George Cross for gallantry instituted in 1940 ranks next to the Victoria Cross. The Military Cross was instituted in 1914. The first awards of the new Elizabeth Cross were made in 2009.

Meerkat. The small mongoose of southern Africa. A group is known as a mob.

Megalith, a prehistoric monument, consisting of a large single stone or a group of such stones, in a circle as at Stonehenge or in burial chambers as at New Grange, Ireland.

Meiosis, special type of cell division by which the gametes or sex cells are generated, resulting in the sperm or ovum receiving only half the number of chromosomes found in a somatic cell. *See* **Mitosis.**

Mela, the Sanskrit term for a gathering or community festival. In India the Hindu Maha Kumbh Mela in 2001 drew 70 million pilgrims (the largest human gathering in history). It takes place every 12 years.

Mendicant Friars, certain religious orders which spread over Europe in the 13th cent., and comprised the Franciscans, Dominicans, Augustines and Carmelites. Originally they depended entirely on alms.

Mercator's Projection, a method of indicating meridians and parallels of latitudes on maps, introduced by Mercator in the 16th cent., and still universally used in navigators' charts.

Mercury, the second smallest of the planets (*c.* one-twentieth of the earth's mass) is the closest to the sun at little more than one-third of the earth's average distance. It appears to resemble the earth in its interior and has about the same density but its surface resembles the moon and is heavily cratered. Its dark surface may be the result of carbon-rich material dropped by passing comets.

Mercury was visited by Mariner 10 which passed within a few hundred kilometres back in March 1974 and which relayed pictures on the two following passes in September 1974 and March 1975 before control of its altitude was lost. It nevertheless continued to revisit Mercury every 176 days (two mercurian years). Mariner 10 was guided to Mercury by the gravitational field of Venus before it became a satellite of the smallest planet. The relayed pictures showed that the planet has an approximately 59-day rotation period exactly two thirds of its orbital period of 88 days. This relationship means that unlike on earth the seasonal variations are with longitude not latitude. Surface temperatures vary from 400°C to −200°C and there is virtually no atmosphere except a thin envelope of helium gas. Mercury has a huge iron core, making the planet incredibly dense. Mercury also possesses the wildest swings in temperature in the solar system (from 427°C to −173°C).

Mariner 10 measured a small magnetic field at the surface about 1 % of the earth's but much stronger than for Venus or Mars. There are no moons.

The *Messenger* spacecraft, launched in 2004, is now orbiting Mercury following its arrival in 2011 (it achieved its first fly-by in 2008). It went on to take images of the "dark side" of Mercury never before seen in detail. *Messenger* revealed evidence of significant volcanic activity on the planet before crashing into Mercury in 2015.

The BepiColombo mission to Mercury was launched in 2013. It is due to arrive in 2019.

Mercury *or* **Quicksilver,** element no. 80, symbol Hg (Latin *hydrargyrum*) is one of the oldest- known metals, whose chief ore is the sulphide, cinnabar, found in certain parts of Spain, China, Japan and South America. It is liquid at ordinary temperature and is used in the construction of barometers and thermometers. Alloys of mercury are called amalgams. It is also of great value in medicine. The metal is used in the mercury-vapour (or "sunlight") lamp, since the vapour gives a bright yellow-white glow in an electric discharge.

Meridian, an imaginary circle extending through the North and South Poles and any given place. When the sun is at its midday height at any place it is "on the meridian"; hence the terms ante-meridian (a.m.) and post-meridian (p.m.). *See also* **Greenwich Mean Time.**

Merino Sheep were imported into England from Spain in 1788 and had great influence in improving native breeds regarding wool. They produce the finest wool.

Merit, Order of, founded by King Edward VII in 1902 as a special distinction for eminent men and women without conferring a knighthood upon them. The Order has twenty-four British companions in addition to foreign honorary members limited in number, as the choice of members is, by the Sovereign's pleasure. Lord Kelvin was the founder companion. Florence Nightingale (1907), Professor Dorothy Hodgkin (1965), Dame Veronica Wedgwood (1969), Mother Theresa of Calcutta (honorary member, 1983), Margaret Thatcher (1990) and Betty Boothroyd (2005) are among the few women to have received this decoration. Nelson Mandela was made an honorary member in 1995. A recent recipient is David Hockney (2012).

Merk. The silver currency used in 16th and 17th century Scotland.

Mesons (from Greek *meso* = middle). One of the four groups of sub-atomic particle given by the Standard Model: gauge bosons (the most famous of which is the photon), the leptons (very light particles, including the electron), the mesons and the baryons. The latter two groups (together termed hadrons) are not truly fundamental, being made up of different combinations of quarks (three quarks forming a baryon, two a meson). The mesons are characterised by their instability; their life expectancy does not exceed 5×10^{-8} seconds. Examples of the meson group are the pions, the kaons, the charmed D's, the upsilon particle and the bottom B's.

Mesozoic. The geological era, including the Triassic, Jurassic and Cretaceous rocks.

Metamorphic Rocks are such geological deposits as have undergone alterations of structure and mineral reorganisation. The most active agents in producing these metamorphic changes are heat, water and pressure.

Metamorphosis, period of development from egg to adult, during which the animals have different forms, as found, *e.g.*, in the life histories of frogs.

Meteorites are small bodies, asteroids, or fragments of asteroids, which survive their fiery passage through the earth's atmosphere and hit the ground. The present surfaces of the moon, Mars and Mercury tell us that all the planets have been subjected since their formation to bombardment by meteorites. Though some large craters are still to be found on the earth, most have disappeared due to extensive weathering over thousands of millions of years. In some meteorites iron and nickel are the chief metals (siderites), others are like rock (aerolites). The iron meteorites are more common amongst those which have been preserved, but falls of rock-like meteorites occur more frequently. At L'Aigle in France in 1803 from 2000 to 3000 meteorite stones fell; this convinced scientists that meteorites really came from outside our atmosphere.

The largest meteorite stone actually known to have fallen to earth is one which descended in Emmott County, Iowa, in 1870, weighing 197 kg. A meteorite weighing no less than 37 tonnes found in Greenland is now in New York.

On 30 June 1908, an enormous object fell in Siberia in a sparsely-inhabited region. A hot blast destoyed all trees within a radius of about 8–16 km. There is still controversy about the Siberian meteorite, whether it was an asteroid or the nucleus of a small comet. *See* **Asteroid**.

Meteoroid, the collective term for meteoritic material found in the solar system. Meteoroids are normally produced by the decay of short-period comets and the collisional fragmentation of asteroids. When meteoroids fall into the Earth's atmosphere they burn up producing a meteor. *See* **Asteroid**.

Meteorology, the science of the atmosphere considered as a heat engine. Deals with weather, climate, optical phenomena, atmospheric electricity, physical processes such as radiation and precipitation, the dynamics and structure of cyclones, anticyclones, *etc.* Meteorological observing stations are in operation all over the world.

Instruments now carried by earth satellites (*e.g.*, *Tiros, Nimbus*) outside the atmosphere can make systematic observations on a worldwide basis of the atmosphere. A new generation of weather satellites (Meteosat Second Generation, MSG) was launched in 2002.

Meteors or more commonly, "shooting stars", are small objects which enter the upper atmosphere to burn up in a bright streak of light. Their origin is mainly in the dust particles ejected in large quantities from comets. Some, particularly the larger and more brilliant ones, called fireballs, are debris of asteroids. Those which reach the earth's surface are called meteorites (*q.v.*).

Methane. The simplest hydrocarbon, compounded of one carbon atom and four hydrogen atoms. This gas occurs over marshes and swamps, where it is liberated in the decay of vegetable matter. It is the main constituent of natural gas, and also occurs in coal-mines, where it is called "fire-damp" because of the explosive character of its mixture with air.

Formerly this natural gas was removed from the coal seams and ran to waste; now in many countries it has commercial uses.

Methane hydrate (or fire ice) has now been extracted from frozen deposits under the sea.

Methylated Spirit, a mixture of 90 parts by volume ethyl alcohol, 9½ parts wood naphtha (methyl alcohol), ½ part crude pyridine, together with small amounts of petroleum oil and methyl violet dye. Industrial methylated spirit consists of a mixture of 95 parts by volume ethyl alcohol and 5 parts wood naphtha. It is used as a solvent and a fuel.

Metre (1), the rhythmical pattern of Verse. (2), unit of length in the metric system; since 1983 has been redefined as "the length of the path travelled by light in vacuum during a time interval of 1/299 792 458 of a second". This definition replaces that adopted in 1960 which used the wavelength of the orange-red line of krypton-86. Before that the "international prototype metre" was the distance between marks on the platinum-iridium bar placed at Sèvres in 1889.

Metric System, the system of weights and measures based on the gram and the metre, smaller and larger units being decimals and multiples of the primary units respectively. A decimal currency was adopted in France in 1795 and the metric system of weights and measures in 1799. (In that year the quadrant of the earth was surveyed and the standard metre adopted.) Since then the metric system has been adopted in most of the continental countries and is used universally in scientific work.

In Britain, it was not until 1965 that the Government encouraged the adoption of the metric system of weights and measures. The changeover to decimal coinage was made in 1971; the system of weights and measures in industry is now mainly metric and "Metrication Day" for the ordinary shopper came on 1 October 1995. The final changeover to the metric system came on 31 December 2009. *See* **T58–60** for **SI** units.

Mica. The mica of commerce is a nearly transparent mineral, which has great heat-resisting power, and can be split into thin plates. The most important micas are muscovite (potassium mica), the commoner variety, phlogopite (magnesium mica) and biotite (the magnesium and iron mica).

Michael, St., and George, St., an order of knighthood originally founded for the Ionian Isles and Malta in 1818, and reorganised in 1869 to admit Crown servants connected with the Colonies.

Michaelmas Day, the festival day of St. Michael and All Angels, 29 September. Goose fairs were held at this time and goose was eaten.

Microbe, a term proposed by Sédillot in 1878 to denote any microscopic organism, vegetable or animal, or found on the borderland between the two great natural kingdoms. The term is commonly used, but not by scientists.

Microelectronics, a rapidly expanding sub-field of electronics. It reduces entire electronic circuits to minute size and embeds them in tiny chips of solid material. These are then called integrated circuits. A circuit consisting of, say, a dozen transistors and fifty resistors can be built into a small piece of semiconductor (*q.v.*) measuring not more than a couple of millimetres in any direction. Hundreds of these circuits can be made simultaneously in penny-size wafers of silicon about one-hundredth of an inch thick. There are great advantages in cheapness, reliability, robustness and speed of electronic performance. The small size is in itself an advantage in space vehicles and medical instruments and computing.

Micrometer, an instrument for measuring minute distances; usually attached to the eye-pieces of a microscope or telescope, and consisting of two very fine hairs or wires stretched across the field of view, one fixed, the other movable. It was invented by William Gascoigne in the 17th cent. and improved by later inventors. Sir Joseph Whitworth made one in 1858 designed to measure the millionth part of an inch.

Micro-organisms, the collective term applied to several types of organism, the most important of which are fungi, viruses, bacteria and protozoa. It is a classification of convenience in biological studies. These organisms are generally simple in their environmental requirements. This makes them very suitable for modern biological research. Much of the information on the nature of the genetic code was obtained from these organisms.

Microphone, device for converting the acoustic energy of sound waves into waves of electrical tiny, used in sound amplifying systems. Developed independently by Edison (1877) and Hughes (1878).

Microscope, invented about 1590 by Janssen, and improved by Galileo, Fontana and others, is an instrument which by a lens system magnifies tiny objects. Microscopes are simple, compound and binocular. *See also* **Electron Microscope.**

Mid-Atlantic Ridge. The world's largest mountain range, stretching 10,000 miles along the ocean floor. It is home to a deep-sea wonderland.

Midge, a biting insect, the scourge of the Scottish Highlands. Mild winters and warm wet summers have seen them spread to the rest of Britain.

Midrash, name given to the homiletical interpretation of some of the Hebrew Scriptures in which allegory and legendary illustration were freely used. Compiled by Jewish rabbis from *c.* A.D. 200.

Midsummer's Day. The halfway point in the calendar year (24 June) and one of the old Quarter Days. Not to be confused with the summer solstice.

Milky Way. *See* **Galaxy.**

Millennium, a period of a thousand years. The term is specifically used of the period of a thousand years during which, according to Rev. xx. 1–5, Christ will reign in person on earth. *See also* **Millennarianism, J33.**

Millipede. Arthropods (**Section T**) allied to the centipedes, from which they differ in having two pairs of legs to each body segment (except the first three) instead of one pair. Worm-like in shape but with a pair of antennae on the head, they can do much harm to garden plants, unlike centipedes which are beneficial. A 420 million-year-old millipede fossil found in Scotland provides evidence it was the earliest creature known to have lived on dry land. Despite their name, they do not have a thousand legs.

Millstone-Grit, a series of grits and sandstones of deltaic origin underlying the coal measures of the Carboniferous system and attaining in England a thickness in parts of 1,525 m. It is from this rock that millstones were made.

Mimicry, protective similarity of an animal to another animal or to inanimate objects. Examples of the former are the hover flies, which mimic wasps and bees; of the latter, leaf insects, stick insects and caterpillars that look like dead twigs.

Minimum Wage. *See* **National Living Wage.**

Mink. Semi-aquatic mammals closely related to polecats. There is one American species and one European. The fur, which varies from light to dark brown, is soft and thick, and is among the most valuable of commercial furs. They are now well-established in the wild in the UK. Mink usually produce a litter of up to 10 kits. They live in holes in riverbanks.

Minnesingers were minstrel poets of Germany who, during the 12th and 13th cent., composed and sang verses of heroism and love. They were of knightly rank, like the French troubadours.

Minnow, a small fresh-water fish of the carp family, abounding in all the waters of Europe; it has a mottled back and silvery belly, and forms a popular bait for trout.

Minstrels were originally specially appointed instrumentalists and singers—pipers, harpers and gleemen—engaged by barons and manorial lords to amuse their tenants. Later, minstrels assumed nomadic habits, made their way into the houses of the great and were generally welcome. By Elizabeth's time, however, they were too numerous, and classed as vagabonds. Minstrels' galleries can be found in some parish churches.

Miracle Plays, medieval verse plays, popular in England in the 15th cent., usually religious.

Mirage, an optical illusion caused by unequal temperatures in different layers of the atmosphere near the earth's surface. These temperature variations alter the refracting power of the air and cause light rays to be curved, making the air act as a huge distorting lens. This can happen at sea, in deserts and elsewhere and various types of mirage are known. A common kind in deserts curves light from the sky so that it appears to come from the ground, deceiving the observer into thinking that the sky is reflected in a lake of water.

Mishna, the first part of the Talmud, setting forth the "Oral Law" of the Jews.

Missal, the name of the mass-book of the Roman Church compiled 492–96 by Pope Gelasius I. The missal used until modern times was sanctioned by the Council of Trent, 1546–63, but the current missal was authorised by Pope Paul VI in 1969 after the Second Vatican Council. In the Anglican Communion the Book of Common Prayer superseded the Missal in 1549.

Mistle Thrush receives its name from its partiality to the mistletoe-berry. Larger than the song-thrush, with spotted breast not speckled.

Mistletoe, a parasitic evergreen with white berries used as a decoration at Christmas-time. The familiar mistletoe of Europe is the *Viscum album*, which grows on the boughs of lime, willow, apple, poplar, maple, ash, hawthorn but seldom on oak-trees. It was sacred to the Druids, and in Norse mythology it was a mistletoe dart that killed the god Baldur. Mistletoe is spreading fast in the UK, helped by the blackcap warbler wintering here.

Mistral, a cold, dry, northerly wind peculiar to the French coast of the Mediterranean.

Mitosis, cell division whereby each daughter cell receives the same number of chromosomes as the parent cell. When the gametes (sex cells) are formed a special type of division occurs (meiosis) in which the number of chromosomes is halved.

Mitre, the twofold pointed head-dress of bishops and certain abbots of the Church.

Moa, the name for several species of ostrich-like extinct birds related to the New Zealand kiwi. The largest species, *Diornis maximus*, stood 2·6 m high, while the smallest, *Anomalopteryx parva*, was nearer the size of a turkey. This wingless bird became extinct because of hunting by the Maoris from whom the name comes.

Moderator, a material used to slow down neutrons in an atomic pile. Examples are pure graphite and heavy water. *See* **Nuclear Reactors.**

Mohole Project, a scheme to bore through the earth's crust to take samples of the mantle rocks beneath. The project, however, was cancelled in 1966 on account of the escalating cost.

The boundary between the earth's crustal and mantle rocks is known as the Mohorovičic Discontinuity, or Moho. The technology of deep sea drilling came from this project.

Molasses, sugar-cane juice in its uncrystallised form after boiling. The crystallised part is the raw sugar. Used to make rum.

Mole, a small burrowing animal with long, sensitive nose, about the size of a small rat, with short legs and forefeet armed with strong claws for digging in the earth. Their subterranean dwellings are of curiously ingenious construction, and they do not often leave them except to make raids on mice, frogs, snails, *etc.* The earthworm is the mole's chief item of food.

Not to be confused with the vole which has a blunt nose. Warm, wet weather has caused mole numbers in the UK to increase.

Mole, or gram molecular weight.

Molecular Anthropology, the relatively new science of the study of the DNA of indigenous peoples to throw new light on human evolution.

Molecular Biology, a rapidly expanding branch of science mainly concerned with cell structure and function at a molecular level, in particular with genes and enzymes and the interaction between the two. Research work in Britain led to the unravelling of the structure of DNA, the hereditary substance of the genes and the nature of the genetic code. *See* **Section T.**

Molecule. A group of atoms held together by chemical forces. *See* **Section T,** *also* **Macro-molecule.**

Molybdenum, element no. 42, symbol Mo, a fairly hard white metal with properties resembling those of chromium. Its commonest ore is the sulphide, molybdenite. The chief use of the metals is in the manufacture of alloy steels.

Monazite, a cerium mineral containing some thorium. Occurs as grains, often as sand ("monazite sands"), derived from granites.

Monday, the second day of the week, called by the Anglo-Saxons *Monandaeg* (moon-day).

Mongoose, species of mammals related to the civets, feeding on vermin and reptiles. These animals, which have long tails and short legs, occur in Africa and Asia (especially India). The biggest mongoose is the Egyptian ichneumon, introduced into the West Indies because of its ability to kill large poisonous snakes.

Monitor, family of lizards resembling dragons. There are *c.* 30 species widely distributed over the tropics. The largest is the komodo dragon whose saliva contains deadly bacteria. This carnivorous animal kills its prey with venom, not bacteria-filled bites, as previously thought. The komodo dragon is now an endangered species. Komodo dragons are the largest lizards. They can grow to 3 m (10 ft) and weigh over 90 kg (200 lbs). They have an incredible sense of smell.

Monkey Nut. *See* **Peanut.**

Monsoons, regular persistent winds which blow at certain seasons in middle latitudes, mainly in South and East Asia. Their occurrence is related to the great changes of pressure which take place between summer and winter over the land mass. In India the south-west monsoon (June–October) is moisture-laden from its long passage over the sea and in the higher regions, especially, there is heavy rainfall. Sudden reversal of the wind results in the cold north-east monsoon (October–March) which is dry on account of the shelter afforded by the mountain ranges to the north. Frequently the term "monsoon" is applied to denote the associated rainfall, not the actual winds. The word monsoon comes from the Arabic *mawsim*.

Month, the 12th part of the calendar year. A lunar month is the interval of new moon to new moon or full moon to full moon; mean length, 29 days, 12 hours, 44 minutes, 2·87 seconds. A sidereal month represents the time of the moon's revolution from a given star back to the same again, 27 days, 7 hours, 43 minutes, 11·5 seconds. In English law, since 1926, a month means a calendar month.

Monument of London, a 202 ft (61·6 m) column, overlooking Billingsgate, designed by Wren and erected (1671–77) to mark the starting-point of the Great Fire of London (1666). The original inscription upon it ascribed the fire to "the treachery and malice of the popish faction", which stood until 1831, when the words were erased as objectionable. The black marble staircase has 345 steps (311 to the balcony).

Moon, the earth's satellite, 3,475 km in diameter and 384,400 km distant from the earth. It rotates in the same time as it revolves round the earth (27 days 7 hours 43 minutes), so that the same face is always presented to the earth. The lunar surface is pockmarked by innumerable collisions with solid particles of all sizes.

Unlike the earth, it is unprotected by any atmosphere and for aeons of time it has been exposed to every kind of cosmic influence, including the parching effect of solar radiation. All moonlight derives from the sun but on the whole it is a pretty poor reflector. The exploration of the moon by means of rockets began in 1959 when the Russian *Luna 2* crashed on the plains of the *Mare Imbrium*. 21 July 1969 will be remembered as the date of the *Apollo* triumphs when man first set foot on the moon.

The samples of lunar rock and dust brought back to earth were closely studied by lunar scientists. Samples date back further than any found on Earth as yet. The most famous, known as the Genesis Rock, is 4,100 million years old. Scientists believe ice may exist in a deep crater near the lunar south pole. The existence of water was confirmed by the *Lunar Prospector* probe in 1998, the first moonshot for 25 years and new estimates in 2011 suggest the Moon contains 100 times more water than previously thought. The Hermite crater, near the moon's north pole, is the coldest known place in the solar system (−238°C).

Recently, scientists have calculated the age of the moon as 4·5 billion years (*i.e. c.* 30 million years after Earth's formation). Scientists believe our Moon was spun off from Earth after a giant collision. In 2018 China plans to land a probe on the dark side of the Moon.

Moonbow. A phenomenon that occurs when a full moon shines during rain.

Moorhen, a widely distributed bird of the rail family, a common resident in the British Isles. The adult is blackish with white under tail coverts, a white line on the flanks and a yellowtipped bill. The frontal shield and the base of the bill are vermilion. It bobs its head, flirts its tail and dives well. The nest is usually placed close to the water's edge or on an overhanging branch. In feeding the young the parents are sometimes helped by their offspring of a previous brood of the season. In N. America it is known as the Florida Gallinule.

Moors, the name given to the Muslims who live in N.W. Africa and to those who once lived in Spain. In 711 Moorish Arabs invaded Spain and spread beyond the Pyrenees into France, where they were driven back by the end of the century. Spain, however, remained virtually under Moorish domination until the 11th cent. and during that period was the most civilised and prosperous part of Western Europe.

In the arts and sciences the impact of Moorish culture was profound and lasting. Examples of the brilliant splendour of Moorish architecture are still to be seen in Toledo, Córdoba, Seville and Granada. During the long struggle for the Christian reconquest thousands were killed and expelled, and in 1492 Granada, their last remaining kingdom, was forced to surrender.

They were virtually exterminated by the Inquisition, and the last were expelled in 1609.

Moose, the largest members of the deer family. The N. American Moose stands up to 2·4 m high, and has huge palmate antlers, but it is declining fast. There is another New World species, occurring in Alaska. The European species is known as the elk.

Morse Alphabet, a system of dots and dashes intended to be used in combination with the indicator in telegraphy; but usually read by sound, the receiving operator writing down the words in the system as transmitted. This system of signals was invented by the American inventor and artist Samuel Finley Breese Morse (1791–1872) of Charlestown, Massachusetts. The Morse Code was replaced on 31 December 1997 by more advanced technology.

Mosque, a house or any open space of prayer for Muslims. The mosque has many functions—social and educational as well as religious. Britain now has over 1,600 mosques and about 2,500 imams.

Mosquito, small two-winged flies with long legs and slender body. Their larvae are aquatic. Only females of some species are blood-suckers, and thus come to transmit the blood parasites which cause malaria and dengue fever, for example. There are 32 recorded species. Diseases carried by mosquitos kill 250,000 people a month globally. Global warming is enabling mosquitos to spread into new areas, such as Europe, bringing tropical diseases. Genetically-modified mosquitos are being bred to destroy malaria and new repellents are being used. *See* **DDT** *and* **Gammexane.**

Mosses. With liverworts, mosses comprise an important group of relatively simple non-vascular land plants, the bryophytes (**Section T**). They are usually small plants, the largest between 30–70 cm high, having been recorded in the Southern Hemisphere. Mosses rarely occur singly, but usually form cushions or small colonies on moist soil, bark, wood, rock or walls. The genus *sphagnum* known as "peat" or "bog moss" is of commercial value in horticulture. In Lancashire and Cheshire lowland moors in which sphagnum is common are known as "mosses". Reindeer moss is a lichen and Spanish moss a seed plant.

Moths, of the insect order, *Lepidoptera*, differing from butterflies which have clubbed antennae, in having feathery, sometimes thin, pointed antennae, rarely clubbed. Most are nocturnal, and the pupae are usually brown and enclosed in a cocoon unlike those of the butterfly, which are usually naked. There are over 2,500 species in Britain, but many of these beautiful insects have been in decline in recent years. (*e.g.* the garden tiger). The Atlas moth is the largest in the world with a wing span the size of a dinner plate. In Britain moths are attracting much interest. *See also* **Lepidoptera.**

Motion, Laws of. According to Newton: (1) A body continues in its state of rest or uniform motion in a straight line except in so far as it is compelled by external forces to change that state. (2) Rate of change of momentum is proportional to the applied force, and takes place in the direction in which the force acts. (3) To every action there is an equal and opposite reaction. These laws are the basis of almost all engineering and everyday mechanics. Corrections to them have been made by relativity and the quantum theory. *See* **Section T.**

Mule, a cross between a male ass and a horse mare; a hinny is a cross between an ass mare and a horse stallion. Also the name of the spinning machine invented by Crompton in 1779 which combined the principle of Hargreaves' spinning jenny with the machine invented by Arkwright.

Mummification, (the preservation of dead bodies) was famously carried out extensively in ancient Egypt and Peru. The custom was also widespread in ancient Britain.

Musk Deer, a small deer of the Himalayas, standing about 51 cm high. It is grey in colour, slightly brindled, and carries a small pouch in the abdominal region, containing what is commercially known as musk. The active constituent of musk, muscone, is now made synthetically.

Mutton Bird, an Australian name of controversial origin for a shearwater or petrel, *e.g.*, the Short-tailed and Sooty Shearwaters and the Great-winged, Kermadec, and White-headed Petrels. The young are taken by hand for human food. Also known as the titi in New Zealand.

Myrrh, a resinous substance obtained from a tree of the natural order *Amyridaceae*, growing plentifully in Ethiopia and Arabia. Its use for embalming, medical and aromatic purposes may be traced back to the most ancient times.

Mysteries, Greek, secret mystic ceremonies of the ancient Greeks, religious drama accompanied by dancing, the most well known being the Eleusinian and Orphic ceremonies.

Mystery Plays were medieval religious dramas performed at great ecclesiastical festivals, particularly in France and Bavaria, staging the Nativity, Passion and Resurrection stories.

N

Nadir, one of the two poles of the horizon, the other being the zenith. The nadir is the pole vertically below the observer's feet.

Nanotechnology. The science of working with tiny things—*e.g.* atoms and molecules. It may well revolutionise electronics, medicine *etc*.

Naphtha, a liquid combustible believed to have been one of the ingredients of "Greek fire". Naphtha is a light, highly inflammable oil obtained by distilling petroleum, shale oil, or coal tar. The petroleum naphtha consists of a mixture of paraffins; that from shale contains olefines as well as paraffins. Coal-tar naphtha contains xylol.

Naphthalene is an aromatic hydrocarbon; it is obtained from coal tar, and its derivatives are much used in the manufactures of colours for dyers and printers. "Moth balls" are made of naphthalene.

Naqba (**Catastrophe**), the Palestinian term for the expulsion of Arabs from their traditional homeland when the State of Israel was created in 1948.

Nardus, a genus of coarse grasses, growing on bleak upland heaths and hill slopes. *Nardus stricta*, known as "mat-weed", is a British species.

Narghile, an oriental tobacco pipe so constructed that smoke passes through water and up a long flexible tube before reaching lips of the smoker.

NASA, the United States government agency which carries out research into spaceflight and aeronautics. NASA was founded in 1958.

National Anthem. The national anthem of the United Kingdom, "God save the King (Queen)", probably dates from the late-17th cent, to mid-18th cent. It was sung in 1745, the year of the landing of the Young Pretender. It had no one composer and was probably a recasting of folk-tunes and plainsong. Resemblances can be traced in pieces by Purcell and John Bull. There are now calls for a specific English national anthem.

National Archives, formerly the Public Record Office and previously in Chancery Lane, London. It is now an executive agency of the Ministry of Justice. The National Archives are where the Public Records of England are preserved, including Domesday Book. These records are all now in Kew.

Modern records are subject to at least a 30-year restriction on access. Some records may be closed for 100 years. A recent proposal called for the halving from 30 to 15 years of current rules of access. A phased reduction to 20 years is now being implemented.

National Curriculum. The Education Reform Act (1988) originally provided for a national curriculum in state schools in England and Wales with three *core subjects* – maths, English and science – and also seven *foundation subjects* – history, geography, technology, music, art, physical education, and a modern language.

In 1995 the compulsory curriculum was reduced (history and geography were no longer compulsory after 14) and attempts to reduce teachers' workloads were made.

Under reforms proposed in 2013, a new curriculum has been taught in schools since September 2014. Its emphasis is on a more traditional academic curriculum (the old 12-times table is now back in fashion). Primary school children will learn more British history and more science will be taught at secondary level. Computing and foreign language skills will be encouraged.

National Cycle Network, an ambitious project to build traffic-free cycle routes. When completed it will put 20 million people within a 10-minute cycle ride of their nearest route.

National Forest, a new forest given approval by the government in 1991. It covers 194 sq. miles in Derbyshire, Leicestershire and Staffordshire and 8·5 million trees have been planted.

National Gallery, established in 1824 at Pall Mall, London, with the Angerstein Collection of 38 pictures, purchased for £60,000, as a nucleus. The existing building which was opened in 1838 has been enlarged several times. It attracts over 6 million visitors each year. The National Gallery at Millbank, the Tate Gallery, was given to the nation by Sir Henry Tate in 1897. *See* **Tate Britain**.

Nationalisation is the taking over by the State of the ownership and operation of an industry or service—*e.g.*, coal-mining, railways, transport, gas *etc*. The banking crisis of 2008 resulted in widespread part-nationalisation of some banks.

National Living Wage. The former National Minimum Wage became law on 1 April 1999. Workers aged 22 or more had to be paid a minimum £3·60 per hour (18–21 year olds at least £3·00).This rate has gradually been increased. From April 2017 the rate was £7·50 an hour and this is planned to reach £9 an hour by 2020 for those over 25. There are calls for the National Living Wage to be raised significantly, nearer to the real 'living wage'.

National Lottery, proposed in 1992 Budget. The first National Lottery draw was on 19 November 1994. The last previous national lottery in Britain was in 1826. Oflot is the Office of the National Lottery. The mid-week lottery draw began in February 1997. In 2002 the National Lottery was revamped with a new name, Lotto. The new Health Lottery was started in 2011.

National Nature Reserves (**NNRs**), reserves to safeguard flora, fauna and physical features, managed by English Nature, the Countryside Council for Wales and Scottish Natural Heritage.

National Parks. Under the National Parks Act 1949 a National Parks Commission was set up to create National Parks in England and Wales. Thirteen have now been established: Peak District, Lake District, Snowdonia, Yorkshire Dales, Exmoor, Brecon Beacons, Dartmoor, Pembrokeshire Coast (the only coastal national park), North York Moors, Northumberland, New Forest, South Downs and The Broads.

National Physical Laboratory, situated at Teddington, is one of the world's largest and best-equipped laboratories. It also maintains British primary standards and physical units. First established in 1900 and managed by the Royal Society. Under privatisation it became an Executive Agency in 1990.

National Portrait Gallery, established in 1856, and now located in a building adjoining the National Gallery. Contains portraits of eminent people in British history as well as a valuable collection of medals and autographs.

National Trust, founded in 1895. "A non-profit-making organisation incorporated by Act of Parliament for the purposes of promoting the permanent preservation of lands and buildings of historic interest or natural beauty for the benefit and access of the people." As a consequence of gifts and public-spirited individuals the Trust, now Britain's largest conservation charity, protects 247,000 hectares of countryside, 1,141 kilometres of coastline and 630 properties (including 200 country houses). The Trust also embraces 28 castles and 6 World Heritage Sites. It is now widening its work to include public parks, *etc*.

Since 1946 lands and houses may be given to the National Trust in lieu of inheritance tax.

NATO, the North Atlantic Treaty Organisation, established 4 April 1949. A defence grouping of Western European states, America and Canada.

Britain is a member. The Russian equivalent was the Warsaw Pact (signed 1955, disbanded, 1991). In March 1999 NATO was extended to include Hungary, Poland and the Czech Republic. Seven additional nations were invited to join NATO at the 2002 Prague Summit. These were Latvia, Estonia, Lithuania, Bulgaria, Romania, Slovakia and Slovenia. After the 2001 terrorist attack, NATO invoked Article 5 of its treaty (commiting signatories to come to the aid of another member) for the first time in its history. In early 2003 NATO was faced with an internal crisis over war in Iraq.

The biggest expansion in NATO's history was in 2004 as 7 former communist countries joined. In 2008 Albania and Croatia were admitted. Montenegro will become the 29th member. Other countries hoping to join, such as Georgia and Ukraine, are unlikely to become members within the next few years. In 2009 France returned as a core member after 43 years of semi-detachment.

The Secretary General of NATO (since 2014) has been Jens Stoltenberg (Norway).

Natterjack, a curious warty, prominent-eyed, brown toad (*Bufo calamita*), having a bright yellow line down the middle of its back. It utters a muttering sort of croak, hence its name.

Natural Gas. *See* **Gas**.

Natural Numbers, the counting numbers 1, 2, 3, 4, 5, ...

"Nautical Almanac", published under the authority of the Admiralty, contains information specially prepared for the use of navigators and astronomers. It first appeared in 1767.

Nautilus, a term now applied only to the pearly-shelled nautilus, the sole surviving example of the four-gilled section of the *Cephalopoda*. Its fossil relatives are called Ammonites. The spiral shell is divided into a number of compartments, the animal living in the last and largest chamber. There are three or four species, all living in tropical seas. The Paper Nautilus is not related to the Pearly Nautilus, belonging to the same order as the octopus.

Nave is the body or main open portion of a church.

Nazca, an ancient civilisation in what is now southern Peru.

Neanderthal, a valley lying between Düsseldorf and Wuppertal, where in a limestone cave a skull of a very early species of prehistoric man was discovered in 1856. *See* **T55.**

Nebra Disc. Bronze Age German artefact, 3,600 years old, used for calculating time

Nebula, a cloud of gas and dust in space. There are three basic types; emission nebulae create their own light, shining through the effects of very hot stars embedded within them; dust particles within reflection nebulae simply reflect the light from accompanying stars; dark nebulae contain no stars and appear as dark patches against a brighter background. They are the cosmic dust clouds where stars are born and die.

Negus, title of the kings of Abyssinia or Ethiopia. The last emperor of Ethiopia, Haile Selassie, was deposed by a military *coup d'état* in 1974.

Nekton, term used to differentiate actively swimming aquatic organisms (*e.g.*, fishes) from the "drifters" or plankton.

Nelson Column, in Trafalgar Square, London, designed by William Railton, was chosen from among a number of designs—temples, obelisks and various sculptural groups—sent in as a result of a competition held in 1839. The erection of the column was begun in 1840. Twenty-six years later the lions designed by Landseer were set up at the foot of the completed column. The statue of Nelson himself was made by E. H. Bailey and the bronze reliefs at the base executed by Carew, Woodington, Ternouth and Watson, representing the Battles of the Nile, St. Vincent, Copenhagen and Trafalgar. Height 52 m, executed in Dartmoor granite from Foggin Tor quarries.

Néné *or* **Hawaiian Goose.** This rare bird was famously saved from extinction at the Severn Wildfowl Trust at Slimbridge by Sir Peter Scott (1909–89).

Neodymium, element no. 60, symbol Nd, belonging to the rare earth metals. Discovered 1885. Named after the Greek word for "new twin', from twin lines in its spectrum.

Neon, inert gas present in air to the extent of about 1 part in 65,000. The crimson glow produced when an electric discharge passes through the gas is familiar in advertising signs. Element no. 10, symbol Ne.

Neptune. This is now classed as the most distant of the *classical* planets, estimated to be about $4{,}497 \times 10^6$ km from the sun, and taking 164·79 years to revolve around it. Discovered by the German astronomers Galle and D'Arrest in Sept. 1846, after its existence had been predicted by Leverrier and Adams. The planet was visited by Voyager 2 in 1989, its last planetary stop. This revealed Neptune had eight moons (not just Triton and Nereid as previously thought) and a ring system. By 2017 the number of Neptune's known moons had risen to 14 with Triton the largest. Its diameter is 49,528 km. A huge Earth-sized storm has been observed, which has been named the "Great Dark Spot'. Winds blow at nearly 900 mph around Neptune's equator, making it the windiest corner of the solar system.

The planet is now known to be surrounded by six rings. It has an average temperature of –218°C and 900 times less sunlight than reaches Earth. Its winter lasts 41 years. Beyond Neptune are the *dwarf planets* (*see* **T9**).

Neptunium, element no. 93, symbol Np, one of the four new elements discovered during the progress of the atomic bomb project in the second world war, Neptunium is formed when a neutron enters nucleus of Uranium 238, and it decays radioactively to yield plutonium.

Neutrino, a neutral particle which carries energy and spin and although possessing little or no mass plays an important part in the interaction of other fundamental particles. The discovery that there are in fact two distinct neutrinos, each with its counterpart, was discovered in 1962. Neutrinos barely interact with normal matter, passing through the Earth as if it did not exist.

The neutrino was 'weighed' for the first time in 2002. *See* **Section T.**

Neutron, a neutral particle present in all atomic nuclei except the hydrogen nucleus which is a single proton. In the development of nuclear science and technology the neutron has played a most important role and neutrons produce the radioisotopes now widely used in medicine, agriculture and industry. Neutrons and protons are termed nucleons. *See* **Section T.**

Neutron Bomb, a thermonuclear fusion weapon which produces increased lethal radiation while the destructive blast and fallout are significantly less than for a fission weapon of equivalent yield; it kills organic life while sparing property, except within a small radius.

Neutron Star. An extremely dense compact star that has undergone huge gravitational collapse so that most of its material has been compressed into neutrons. They are the remaining core after a star has undergone a supernova explosion. A typical neutron star may be only about 15km across and has an intense magnetic field.

New Commonwealth, term used to describe the former British colonies which became members of the Commonwealth following their post-World War II independence. The New Commonwealth, mainly black and Asian, was contrasted with the 'old' white Commonwealth dominions.

Newgate Prison was situated at the western end of Newgate Street, opposite the Old Bailey at the site of one of the old London city gates. There is a record of a prison upon this spot in the 13th cent. Later a new one was built by the executors of Richard Whittington, but this was destroyed by the Great Fire in 1666. Still another new prison on this site was erected between 1778 and 1780. In the Gordon Riots it was destroyed by fire and re-erected. Not used as a prison after 1880.

Newspapers. The first news-books to be published at regular intervals in Britain appeared in 1662 with news of what was going on abroad translated from German and Italian news-sheets. Licence to print was obtained from the Star Chamber, which until its aboli-tion in 1641 allowed only the printing of foreign news. With the lifting of the ban on domestic news the Press became free.

In the reign of Queen Anne newspapers employed writers of great intellectual power and versatility. Despite the newspaper tax introduced in 1712, the number of newspapers published in London in 1776 had increased to 53, though the standard of writing declined.

The development of the Press was greatly assisted in the 19th cent. by the abolition of the "taxes on knowledge", by the introduction of the cheap postal system and by improvements in printing, distribution, advertising *etc*.

The *London Gazette*, founded in 1665 (and still appearing twice weekly as the official organ of the Government), is the oldest newspaper living. *The Times* began as the *Daily Universal Register* in 1785, and adopted its present title on 1 January 1788.

The *Manchester Guardian* (renamed *Guardian* in 1959), began life as a weekly in 1821, and became a daily in 1855. The *Scotsman*, founded as a weekly in 1817 and established as a daily in 1855, and the *Glasgow Herald*, which began as the *Glasgow Advertiser* in 1783, are the leading Scottish newspapers. The first evening newspaper, the *Star and Evening Advertiser* was published in London in 1788. During 1989, the last national newspapers left Fleet St. The very last journalists left in 2016. In 1993 *The Guardian* acquired *The Observer*. In November 2003 a "compact" version of *The Times* was published. The "Berliner" *Guardian* was launched on 12 September 2005. *The Observer* followed on 8 January 2006.

The *Independent*, founded in 1986, ceased print publication in 2016 (becoming the first digital-only national newspaper). A new paper, *New Day*, began on 29 February 2016 (the first new daily paper for 30 years). It closed after only nine weeks.

Newt, amphibian of lizard shape and mottled markings. There are three British species, the largest being the Great-Crested Newt (*Triturus cristatus*), which attains a length of 15 cm.

Newton, the unit of force in the SI system of units. Under its influence a body with a mass of 1 kilogram will accelerate at a rate of 1 metre per second each second.

Newton's Rings. Concentric circular rings, due to the phenomenon of interference, which are seen around the point of contact of a slightly convex lens with a flat plate of glass.

New Towns. Under the New Town Act 1946 and subsequent Acts some 33 new towns were designated in Britain; 23 are in England and Wales, five in Scotland and four in Northern Ireland. They were: Basildon, Bracknell, Crawley, Harlow, Hatfield, Hemel Hempstead, Milton Keynes, Northampton, Peterborough, Stevenage and Welwyn (to relieve housing problems in Greater London); Newton Aycliffe, Corby, Cwmbran, Peterlee and Washington (to serve the special needs of their areas); Newtown (to help stem rural depopulation in mid-Wales); Runcorn and Skelmersdale (to meet the overspill needs of Liverpool and north Merseyside); Telford and Redditch (to take population from Birmingham); Warrington (expanded to take people from Liverpool and Manchester); Central Lancashire New Town (based on existing towns of Preston, Leyland and Chorley).

The five Scottish new towns comprise Cumbernauld, East Kilbride, Glenrothes, Irvine and Livingston. In Northern Ireland Craigavon was developed as a new city; Antrim and Ballymena were to become centres of economic growth; Londonderry and the surrounding district were designated as an area of special development.

Plans were announced in 2008 for 15 new *eco-towns*, to be built by 2020. They will be carbon-free and pathfinders in terms of areas of sustainability. These plans were subsequently scaled down. Sites approved in 2009 were Rackheath (Norfolk), Whitehill Bordon (East Hampshire), North West Bicester (Oxfordshire) and the China Clay Community (near St. Austell, Cornwall).

New Year's Day, 1 January. The first New Year's festival of which we know is that constituted by Numa 713 B.C., and dedicated to Janus.

Nibelungenlied, the German epic of the early 13th century, comprising numerous mythical poems or sagas. Wagner's *The Ring of the Nibelungs* was based on Norse legends and the Nibelungenlied.

Nicene Creed, a summary of the principles of Christian faith, first issued in 325 by the Council of Nicaea (summoned by the emperor Constantine the Great) for the purpose of thwarting the Arian heresy and asserting the godhead of Christ. Date of Easter fixed at Council of Nicaea.

Nickel, silver-coloured metallic element, no. 28, symbol Ni, fairly soft though harder than iron. Chief source of the metal is the nickel sulphide in iron-copper pyrites deposits in Ontario. Chief uses are: in electroplating, in coins, as an element in alloy steels. A novel method of making pure nickel (by treating the metal with carbon monoxide and heating the resulting liquid, nickel carbonyl) was developed in 1890 by Mond. This discovery led to many technical advances in industrial chemistry, one of which is the production of catalysts. Discovered by Crondstedt in 1751 as an impurity in copper ore. Substituted for silver in French coinage in about 1882.

Night Heron, a stocky, short-legged heron of black and white plumage, red eyes and yellowish legs, crepuscular except in breeding season, and an occasional visitor to Britain.

Nightingale, a once familiar singing bird which visits the southern counties of England every summer, and is sometimes found as far north as Yorkshire. It is a shy, brown bird, not often seen, but the song of the male, usually heard in the late evening or early morning, is of remarkable sweetness and variety. After its wooing period is over its song ceases. There are now less than 6,000 singing male nightingales left in Britain.

Nightjar, nocturnal, insectivorous bird, owl-like in appearance, with mottled brown plumage of "dead leaf " pattern, and a churring song. It is a common breeding visitor from Africa to the British Isles, April to September, laying its eggs on bare ground. It lies motionless on the ground, giving it a near-perfect camouflage.

Niobium is a metal element, no. 41, symbol Nb, related to vanadium. Technical development has been slow because of its rare occurrence, although niobium is now used in ferrous alloys to increase resistance to corrosion and produce steel which can be used at high temperatures.

Niqab, the face veil worn by some Muslim women. It was banned in France in 2012.

Nitre *or* **Saltpetre,** is now mostly manufactured by the double decomposition of sodium nitrate and potassium chloride. Its chief use is the manufacture of gunpowder and fireworks. It has been manufactured in England since 1625.

Nitrogen, a non-combustible gaseous element, no. 7, symbol N, devoid of taste or smell, and constituting nearly four-fifths of the atmospheric air. Nitrogen compounds are essential to plants and animals, and are used in fertilisers. Nitrogen pollution in the soil is now a major threat.

Nitro-Glycerine, an explosive yellow fluid produced by mixing small quantities of glycerine with a combination of one part of nitric acid and two parts of sulphuric acid. By itself it is a dangerously explosive substance to handle. In 1867, Nobel produced dynamite, a safe explosive made by absorbing nitro-glycerine in kieselguhr.

Nitrous Oxide, a compound of nitrogen and oxygen possessing mild anaesthetic power. Termed "laughing gas" on account of its exhilarating effect. It is still used in dentistry, and for minor operations and has proved useful in a new technique for finding leaks in water mains.

Nobel Prizes. The Nobel Foundation was established to give effect to the wishes expressed by Alfred Nobel (*see* **Section B**) in his Will. *See* **G17–20**.

Nones, dates of the Roman calendar which fell on the 5th of each month, excepting March, May, July and October, when they fell on the 7th.

North-East Passage, from the North Atlantic to Bering Strait was rapidly developed by the former USSR as a northern sea route to render accessible vast areas of northern Siberia. Attempts to find a North-East passage were made by Englishmen and Dutchmen in the 16th cent. but they were always defeated by the ice, for the sea is completely frozen for some 4,800 km for 9 months of the year. A Swede succeeded in sailing from Europe to Japan via the Arctic between 1878 and 1880. In 2009 two German container ships successfully navigated the Russian North-East Passage across Arctic waters from the Pacific for the first time. Other vessels (including Chinese merchant ships) have followed. *See also* **Arctic Exploration.**

North-West Passage, from the Atlantic to the Pacific through the Arctic Seas, has been the dream of navigators for centuries. Attempts to find it were made in the 16th and early 17th cent. by John and Sebastian Cabot, Frobisher, Gilbert, Davis, Hudson and Baffin. Two centuries later Ross, Parry, Franklin and others made the attempt; but it was not until 1903–5 that Amundsen, discoverer of the South Pole, made the complete voyage in the *Gjoa*. The Canadian icebreaker *Labrador* was the first deep-draft vessel to traverse the North-West Passage

(1954) and the US tanker *Manhattan* was the first commercial vessel to do so (1969). Continued global warming has now opened up the prospect of commercial shipping for longer periods each summer, a development that could change the face of world trade. Indeed, before too long, ships could even be sailing over the North Pole.

Canada claims authority over the North-West Passage shipping route whilst the USA insists it is an international waterway.

Notornis. *See* **Takahe.**

Notre Dame, the famous Paris cathedral, was founded in 1163. Famous Gothic architecture.

Notting Hill Carnival. A Caribbean festival, first held in St. Pancras Town Hall in January 1959. Now one of the largest street festivals in Western Europe.

November, the 9th month of the year originally, but from *c.* 700 B.C., when Numa added January and February, it became the 11th month.

Nuclear Energy. Atomic nuclei consist of protons and neutrons joined in various proportions (**T11**). The heaviest naturally occurring nucleus contains 238 particles (92 protons, 146 neutrons) and is uranium 238 (U^{238}); the lightest is hydrogen, which consists of 1 proton. Neutrons and protons attract one another by very strong forces which are not at all well understood; they are called *nuclear forces.* Consequently it requires energy to be supplied if a nucleus is to be pulled apart into its constituent particles. The energy is required to overcome the attractions of the nuclear forces. Conversely, when the particles rush together to form a nucleus energy is released as heat or radiation.

The energy released when protons and neutrons coalesce to form a nucleus is called *Binding Energy.* The binding energy of a nucleus divided by the number of particles involved is called the binding energy per particle, which we will call B. It is very difficult to overestimate the importance of B to the human race. B varies from nucleus to nucleus, and the exact form of its variation is only roughly understood at the present time. But the most significant thing is that B is greatest for elements of medium atomic weight and lowest at the heavy (uranium) and light (hydrogen) ends of the periodic table. This means that if middleweight nuclei can be formed either from heavy ones or from light ones, B increases and energy is released in either case.

Nuclear Fission. *See under* **Fission.**

Nuclear Fusion. If light nuclei are hurled at high speeds into intimate contact they sometimes coalesce and release binding energy (*see* **Nuclear Energy**). This has been studied in laboratories where powerful and energy-consuming machines accelerate small numbers of particles for purely experimental purposes. If useful amounts of energy are to be gained these fusion reactions will have to occur on a bigger scale in an apparatus from which the resulting heat can be extracted in a controlled way.

The one "useful" fusion device so far made is the thermonuclear bomb ("H-bomb"). Thermonuclear is the important word. If a suitable gas can be raised to a very high temperature the nuclei are stripped of their electrons and all particles move with very high speeds. The gas is then called a plasma. High enough temperatures will make speeds great enough for fusion reactions to occur and nuclear energy to be released. This is a thermonuclear reaction. For example, in deuterium gas, at temperatures over a million degrees Centigrade, the deuterium nuclei (*i.e.*, heavy hydrogen nuclei consisting of 1 proton joined to 1 neutron) interact to produce helium nuclei. To obtain a net gain in energy from this process, the temperature must be raised to about 100 million degrees C and maintained long enough; otherwise the energy released is less than that required to heat the fuel and to make up for heat losses.

New attempts to study the staggering technical problems are being made, and fusion research is very active in Britain, the USA, Japan and the Russian Federation. The joint European Torus (JET) fusion research project sited at Culham near Oxford aims to develop a new source of energy for the generation of electricity for the 21st cent. In 1991, the JET project achieved a two minute successful nuclear fusion, bringing nearer the prospect of new energy sources. A new way to use lasers to make atoms fuse together to release vast amounts of fusion energy was reported in 2001. The new technique is known as "fast ignition".

Nuclear Power Stations. In 2017 Britain generated around 21% of her electricity in nuclear power stations. (compared to 75% in France) The numerous older nuclear power stations all developed from the classic Calder Hall type, burning natural uranium inserted in a graphite moderator and cooled by carbon dioxide gas.

They were called Magnox stations because the fuel elements of natural uranium rods are encased in magnesium alloy cans (the last Magnox station, Wylfa I, has now closed). A second nuclear power programme based on the advanced gas cooled reactor (AGR) at Windscale included the reactors at Dungeness "B", (1983) and those at Hinkley Point "B", Hunterston "B", Hartlepool (Cleveland) and Heysham (Lancashire). In 1987, after the Layfield Report, the Government gave approval for the Sizewell B project to become Britain's first pressurised water reactor.

In 1994 the Government gave the go-ahead for the controversial Thorp nuclear reprocessing plant at Sellafield. The Sizewell B PWR became the latest nuclear power station in February 1995. After the Government's 1995 Nuclear Review, the industry was substantially restructured in preparation for privatisation in July 1996.

In January 2008 uncertainty over the future of nuclear power seemed to end when the government gave the go-ahead for a new generation of nuclear power stations. No limits were put on their numbers. In 2013 the go-ahead was given to build Hinkley Point C in Somerset but the project remains beset by controversy.

Nuclear Reactors are pieces of apparatus designed to permit nuclear chain reactions to occur under controlled conditions. (Uncontrolled chain reactions are dangerous, *e.g.* atomic bombs.) The success of a reactor depends on the neutrons reaching the U^{235} nuclei to produce more fissions and not being wasted in irrelevant processes or simply escaping through the wall of the apparatus (neutrons are quite difficult to contain). The neutrons leaving the scene of fission are rapidly moving, and they stand more chance of causing another fission if they are slowed down. Consequently a material other than the uranium has to be present to facilitate this, and it is called a moderator. A useful moderator is pure graphite.

Thus a reactor may consist of alternate blocks of uranium and graphite. If the reactor is too small so many neutrons escape that there are not enough to keep the chain reaction going. The reactor must therefore be greater than a certain *critical size.* In order to intensify or damp down the chain reaction it is arranged for pieces of neutron-absorbing material, such as cadmium, to be inserted or withdrawn as required. While the chain reaction is proceeding countless numbers of fissions are occurring, each one liberating energy which turns into heat. The temperature therefore increases, and to prevent a catastrophic rise, cooling has to be provided.

Hence the reactor has cooling pipes through which a fluid coolant is pumped. The coolant carries the heat away and, in a reactor designed to produce electrical power, the heat is taken to steam-raising boilers and the high-pressure steam is led to turbines which drive the electric generators.

What has been described above is the type of reactor first used for power production at Calder Hall (1956). This was a graphitemoderated, gas-cooled reactor using as fuel natural uranium (*i.e.*, fissile U^{235} greatly diluted with U^{238}). Other thermal types of nuclear reactor are the advanced gas-cooled reactor (AGR), the high temperature reactor (HTR), the steam-generating heavy-water (SGHWR) and the light-water reactor (LWR). It is also possible to make reactors work without slowing the neutrons with a moderator; these are called *fast reactors.* The design of the prototype fast reactor (PFR) at Dounreay was based on experience gained with the Dounreay experimental fast breeder reactor (closed 1977 after 17 years' safe operation) which was the first to produce electricity on a commercial scale (1962) and achieved the highest power output of any of its type in the world. These fast reactors can produce new nuclear fuel in the course of their operation and therefore offer great economies; but they are more difficult to develop than thermal reactors.

The fuel is made from the mixed oxides of plutonium and uranium and the coolant is liquid sodium metal.

Environmental considerations have become of increasing concern. Most of the products of the fission process are of necessity radioactive isotopes: they could be gaseous, like krypton, xenon and tritium or solid like strontium, caesium, zirconium and ruthenium. There are also present the new radioactive elements plutonium, curium, actinium, *etc.*

Furthermore, in both the nuclear reactor and in the plant which is used to chemically treat and reprocess the nuclear fuel, radioactivity will be induced in associated structural materials, to varying degrees. In this latter case, unlike the former, the radioactive waste with which one is left can to a great extent be selected and is largely overshadowed in importance by the waste arising from the fission and breeding processes. Even if the whole of the UK electrical power was produced by nuclear means, the volumes of such wastes would be relatively small and need in principle tens of acres of storage area. Much of the activity would decay in a decade, a great deal more in a century, but that associated with the elements bred from uranium, would be present for thousands of years: Pu^{239} has a half-life of 25,000 years.

Segregation of the various types of activity is feasible; their incorporation into physically and chemically stable form has received a great deal of study so that storage, readily monitored even for many generations, seems entirely possible.

The radioactive properties of these wastes can only be changed by nuclear reactions. Bombardment with neutrons or other highly energetic particles can bring about such reactions so that forms of "nuclear incineration" are feasible but are not yet fully explored.

Nucleic Acids. Living matter is built up of cells each of which has a nucleus surrounded by cytoplasm. Cell nuclei are composed chiefly of substances called nucleoproteins, which consist of a protein attached to a nucleic acid (this original name is still used, although nucleic acids are found in the cytoplasm as well as the nucleus). Nucleic acids are complex organic structures made up of chains of compounds called nucleotides.

Nucleotide molecules have a sugar group attached to a nitrogenous base and a phosphate group. Only two sugar groups are found in the nucleotides, ribose, giving rise to ribonucleic acids (RNAs, found mainly in the cytoplasm) and deoxyribose, which forms deoxyribonucleic acids (DNAs, found mainly in cell nuclei). Seven different nitrogenous bases have been isolated, so that a number of different nucleotides are possible. A repeating, regular pattern of nucleotides is linked by the phosphate groups, forming nucleic acids.

The functions of nucleic acids are of fundamental importance. They are concerned in the process of transmission of inherited qualities in reproduction and in building up body proteins.

Nucleosynthesis, the creation of the elements in the universe. This occurred approximately 100 seconds after the big bang, ceasing *c.* 900 seconds later.

Nuthatch, name of a number of tree-creeping birds, plump, with a short tail, bluish-grey plumage and black stripe under eye. Nest in holes and wedge nuts in bark of trees, hammering them to get a kernel. There are three European species, one, *Sitta europaea*, thriving in England.

Nutria Rat. *See* **Coypu**.

Nylon, a generic term for any long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain, and which is capable of being formed into a filament in which the structural elements are orientated in the direction of the axis. The first nylon of commercial interest was made in 1935, and the world's first nylon factory—in the United States—began production in 1940.

O

Oak, a tree of the genus *Quercus*, including some 300 species distributed over the northern hemisphere and into the tropics. Two species are native to Britain, *Q. petraea*, more common in the west and north on shallower, lighter soils, and *Q. robur*, more common in the south on deeper, heavier soils. Oak timber is much prized for its strength and durability, and from the time of the Spanish Armada to Nelson's day was in great demand for naval construction. It has always been used for building, flooring, furniture and cabinet work. Oaks support more life than any other British tree. The oak is attacked by many insects, the round nut-like oak galls, or oak-apples, being produced by the sting of certain minute gall wasps.

Recently a new threat (acute oak decline) has been confirmed in England. Caterpillars of the Oak Processionary Moth are a growing threat.

"Oaks", a famous race for three-year-old fillies run at Epsom one day after the "Derby".

Oarfish. *See* **Ribbon Fish**.

Obelisk, a tapering monolithic column, square at the base and pyramidal at the top, regarded by the ancient Egyptians as a sacred stone and usually found at the entrance to the sun temples. Many were transported from Egypt and set up at various times: there is one in the Place de la Concorde in Paris, and one on the Embankment in London—Cleopatra's Needle—first erected at Heliopolis, centre of the sun-cult, by Tuthmosis III *c.* 1500 B.C.

Observatories. *See* **Astronomy** *and* **Telescope.**

Obsidian, a black volcanic glass-like rock. It played a key role in some early Meso-American civilisations.

Occitane, language still spoken in southern France.

Occultation, the passage of one celestial object in front of another, where the closer object has a larger apparent diameter than the more distant one and which, therefore, temporarily hides it from view. An example is the passage of the Moon across the Sun during a total solar eclipse.

Ocean, comprises the great body of water which covers seven-tenths of the surface of the earth, and has an average depth of 3·2 km. The principal oceans are the Pacific, Atlantic, Indian and Arctic. The greatest ocean depth is in the Pacific, in the Mindanao Deep, 37,782 ft (11,524 m). More than 70 % of our planet's surface is covered by water. The oceans are now warming at their fastest rate for 3,000 years and sea levels are rising. Scientists are noting that warming temperatures are bringing subtropical fish species to the seas around Britain.

The current Neptune Project is creating a massive submarine laboratory to examine the almost unknown world on the ocean floor. Many thousands of previously unknown living creatures have been identified in the World Register of Marine Species. The Register now contains the names of more than 227,000 creatures—still only a fraction of marine life. Scientists are now planning to map the ocean floors by 2030. Commercial deep-sea mining of the natural mineral resources of the oceans is also beginning.

Ocean Currents are well-defined streams running over certain portions of the ocean and caused mainly by wind-friction, slope of the sea surface and differences in density of the water, all movements being influenced by the deflective forces due to the earth's rotation. The climatic importance of the great ocean currents is that they constitute one means whereby heat is transferred from lower to higher latitudes.

Oceanography is the scientific study of the world ocean, *i.e.*, the single connected body of water that covers 70·8 per cent of the earth's surface.

Modern oceanography dates from the voyage of HMS *Challenger* (1872–6) during which wide-ranging observations of the ocean were made.

Ocelot, the wild cat of S. America. It is about 1·2 m in length, including tail, and of a grey or tawny colour and spotted. Closely related to the Leopard. Now almost extinct in the Amazon rain forest.

Octane Number, the index of the knock-rating of petrol. It is based on the arbitrary scale in which iso-octane (which does not cause "knocking") has a value of 100, and normal heptane (which is prone to "knocking") has a value of 0. A good fuel for modern cars must have an octane number greater than 80.

October, the 10th month, but the 8th in the old Roman calendar. It was held sacred to Mars.

Octopus, a genus of marine molluscs with eight tentacles that bear suckers. They have three hearts, blue blood, an excellent sense of touch and very good eyesight. Its genome has been decoded. A previously unknown species was found in 2016 in the Pacific.

Odyssey, Homer's epic setting forth the incidents of the wanderings of Odysseus on his way back to Ithaca after the siege of Troy.

Oersted, a unit of magnetic-field intensity in the cgs system.

Ohm's Law, propounded by G. S. Ohm in 1826, is expressed in the equation: electromotive force (in volts) = current (in amperes) × resistance (in ohms). The ohm is the unit of electrical resistance in the metre-kilogram-second system.

Oil. The great expansion in energy demand over recent years has been met to a large extent by petroleum oil. This contains a wide range of hydrocarbon molecules of varying complexity. The various components are separated from each other by making use of their different boiling points. Crude oil is heated in the base of a fractionating tower; the various components condense at different temperatures in trays at different levels of the tower.

The fraction of a given composition can be increased by "cracking" or breaking down the heavier hydrocarbons into lighter ones.

The cutback and the rise in the price of Middle Eastern oil following the 1973 Arab- Israeli war was succeeded for 25 years by a glut of oil and falling prices. Fears over world oil supplies caused the price to rise sharply (it touched $140 in 2008) but the price rapidly fell to below $50 as global recession deepened. It rose again in 2012 but collapsed late in 2014 and was down to below $30 by Spring 2016 before a recovery began.

Development began in 1996 of oil production in the Atlantic (there are huge reserves in the Foinaven field west of the Shetland Islands). This area is known as the "new North Sea". The first British North Sea field (the Argyll) dried up in 1992 having produced 97m barrels. Britain's largest on-shore oilfield is at Wytch Farm (Dorset).

In 2000, output of crude oil and natural gas liquids in the UK averaged 2·7 million barrels a day (making the UK the world's tenth largest producer). UK oil production peaked in 2002.

Major new oilfields continue to be found (*e.g.* offshore Brazil, West Africa, Gulf of Mexico). Some leading oil producers are Russia, Saudi Arabia, the USA, Iran and China. By 2020, the USA is set to be the largest crude oil producer. In 2012 China overtook the USA to become the top oil importer.

Venezuela has the largest proven reserves of crude oil, surpassing even Saudi Arabia.

Okapi, nocturnal secretive ruminant mammal, smaller than the giraffe, chestnut brown in colour with zebrastriped legs, native to the Congo, where civil war has devastated its numbers.

Olbers' Comet was discovered in 1815 by Olbers the German astronomer. Olbers also discovered the asteroids Pallas and Vesta (1802–07).

Old Red Sandstone, the continental rocks formed during the Devonian period. *See also* **Geology.**

Olefines, a series of hydrocarbons, in which the hydrogen atoms are double the number of carbon. The first member of the series is ethylene.

Olinguito, a newly-discovered carnivorous mammal. It is a tree-dwelling relative of the raccoon. Found in Colombia and Ecuador.

Olive. This small tree, whose fruit yields olive oil, is a native of the eastern Mediterranean, but has been introduced into cultivation elsewhere. The green unripe fruit is pickled in brine for table olives. Olive oil production can be traced back at least to 2,400 B.C. in Syria.The Ancient Greeks called olive oil liquid gold. Spain is the biggest producer of olive oil. "Olive tree leprosy" is a serious threat in Italy. New sources of olive oil are Morocco, China and Latin America.

Olmec, ancient civilisation of Mesoamerica (Central America), now seen as the "mother culture" of the Maya and Aztec. They developed urban ritual and political centres and may have been the first to formalise structured writing. They worshipped the mythical were-jaguar. They used rubber and built pyramids.

Olympiads were periods of four years which elapsed between each celebration of the Olympic games, held at Olympia in honour of Zeus. These festivals included competitions in literature, art, drama, rhetoric, music and gymnastics, and they were continued, with intervals, from 776 B.C. to A.D. 394. Modern Olympics have taken place at Athens 1896, Paris 1900, St. Louis 1904, London 1908, Stockholm 1912, Antwerp 1920, Paris 1924, Amsterdam 1928, Los Angeles 1932, Berlin 1936, London 1948, Helsinki 1952, Melbourne 1956, Rome 1960, Tokyo 1964, Mexico City 1968, Munich 1972, Montreal 1976, Moscow 1980, Los Angeles 1984, Seoul 1988, Barcelona in 1992, Atlanta, Georgia, 1996 (the Centennial Olympics), Sydney, 2000, Athens, 2004, Beijing in 2008, London 2012 and Rio de Janeiro (2016). Tokyo will host the 2020 Olympics.

The first Winter Olympics were held at Chamonix in 1924. The last were in Sochi in Russia in 2014. The next will be in 2018 in Pyeonchang (S. Korea). Beijing will host the 2022 Winter Olympics (the first city to host both the Summer and Winter games).

Onomasticians are scientists who study the fascinating subject of names—names of places and names of people—to find out their origins. They tell us, for example, that Cambridge is an Anglo-Norman corruption of *Grantabrycg* =bridge over the Granta; that Harrow-on-the-Hill was an early Anglo-Saxon settlement—"heathen temple on the hill"; that we owe the ridings of Yorkshire to the Vikings (Old Norse *thrithungr* = third part); that in Scotland *-ton* and *-toun* indicate not a town but a hamlet or village.

Onyx *or* **Sardonyx,** a variety of chalcedony built up of different-coloured layers, which are parallel and straight (not curved as in agate).

Oolite, a geological term for the Jurassic oolitic limestones existing through a long stretch of country extending from Yorkshire to Dorset. It abounds in fossils of molluscs and reptiles.

The term "oolite" derives from the fact that these rocks are made of egg-shaped particles of calcium carbonate.

Oort Cloud, the hypothetical swarm of billions of comets that surrounds our solar system, *c.* 50,000 times further from the Sun than our Earth. The Oort Cloud represents the outermost limits of the Sun's gravitational influence.

Opal, a mineral consisting of hydrous silica, occurring in numerous varieties and colours. Opals have been prized as gems since at least 400 B.C.

Their unique internal "fire" or opalescence is a result of the diffraction of light by a regular array of tiny silica spheres, about 100 nm in diameter, of which gem opals are now known to be composed. Opal miners are called gougers. Chief source—the Andanooka and Coober Pedy fields of South Australia.

Open University. *See* **Universities.**

Opossum, marsupial mammals found in the more southerly of the United States, South America and Australasia. They are arboreal except for the water-opossum, which eats fish.

Optics, the branch of physics which investigates the nature and properties of light and the phenomena of colour. Burning lenses were known to the ancient Greeks and Ptolemy wrote a treatise on optics A.D. 150. Lenses as visual aids were known in ancient China but eyeglasses were not in use until the 13th cent. Spectacles were in more general use after the invention of printing in the 15th cent. The camera obscura was invented in the 16th cent. and the telescope and microscope early in the 17th cent.

Oracles were in ancient times supposed to be words spoken by the gods, and it was the custom on important occasions to consult them about the future. The Greeks had the Oracles of Zeus at Dodona, and Apollo at Delphi, while the Romans consulted the Oracles of Mars, Fortune *etc.*

Orange, a fruit growing in most sub-tropical climates. It is grown on an evergreen tree that attains a height of about 6 m at maturity.

Orangutan, one of the largest of the anthropoid apes, found only in the swampy forests of Borneo and Sumatra. When full-grown it stands over 1·2 m in height and weighs *c.* 67 kg. Fruit is the mainstay of their diet. The male may live up to 45 years. All of the great apes face a threatened future from deforestation and demands for food ("bushmeat"). Attempts to protect them are underway. They can swim across rivers and are one of the smartest species on the planet. They spend more time walking on the ground than previously thought. Young orangutans have the longest childhood of any non-human primate.

Orbit, is the path of one celestial object around another. For example, the path of the Earth around the Sun.

Orca. *See* **Whales.**

Orchestra. The composition of a typical symphony orchestra is as follows: Strings: 1st Violin (16), 2nd Violin (16), Viola (12), Violoncello (12), Double Bass (8). WoodWind: Flute (3–4), Piccolo (1), Oboe (3), Cor Anglais (1), Bass Oboe (1), Clarinet (3), Bass Clarinet (1), Bassoon (3), Contra-bassoon (1). Brass: Horn (6), Trumpet (5), Trombone (3–4), Tuba (2). Percussion: Timpani (3–6), Side Drum (1), Bass Drum (1), Cymbals (1), Harp (2).

Order of Merit. *See* **Merit, Order of.**

Ordination, the ceremony of installing ministers or clergymen in clerical offices. In the Anglican and Catholic Churches the rites of Ordination are performed by bishops; among Nonconformists it is done by the governing bodies. The first women were ordained Anglican priests in 1994.

Ordnance Survey. Founded initially in 1791 as the Trigonometrical Survey, the Ordnance Survey was established by the 1841 Ordnance Survey Act. The famous maps were first produced on a scale of 1 inch to the mile (but are now available on various scales and constantly revised). In 2016 it released a map of Mars, its first non-Earth map.

Organic Farming, means the production of food or other farm produce without artificial fertilisers or chemical pesticides.

Organic Light Emitting Diode (OLED), a light source based on natural bioluminescence (*q.v*).

Orimulsion, an emulsified bitumen fuel which comes from Venezuela.

Orioles, brilliantly coloured birds, members of the passerine family *Oriolidae*, found in the tropical regions of Asia, Africa and Australia. The golden oriole, perhaps the most beautiful of them all, with brilliant yellow plumage, black wings and tail, winters in Africa, visits England and is known to have nested here.

Orion, a famous constellation of the heavens, comprising nearly a hundred stars, all visible to the naked eye. It contains three stars of the second magnitude in a line, called "Orion's Belt".

Ormer, a shellfish (*Haliotis tuberculata*) which occurs in the Channel Islands and on parts of the French coast. It is a great delicacy.

Ornithology, the scientific study of birds.

Ornithorhynchus. *See* **Duckbill.**

Orogeny, large-scale earth movements, including faulting and folding and sometimes igneous activity, which produce a linear belt of mountains, *e.g.*, the Alpine orogeny in Europe.

Orphrey, the name of an ornamental strip richly embroidered on ecclesiastical vestments.

Orrery, an instrument used in the 18th and early 19th cent. which showed the motions of the planets round the sun and the satellites round their primaries. The first orrery made was named after Charles Boyle, Earl of Orrery.

Ortolan, small songbird, now a protected species. Almost hunted out of existence as a delicacy for gourmets in France. Illegal hunting still continues.

Oryx, the inspiration behind the myth of the unicorn. An oryx can travel longer without water than a camel.

Osborne House, near Cowes, in the Isle of Wight. Queen Victoria's favourite winter-residence, and where she died.

Osier, a species of willow growing in damp soils and yielding branches utilised in basket-making.

Osmium, a very hard, bluish-white metallic element, no. 76, symbol Os, of the platinum group and one of the heaviest of known metals. It is obtained from certain sands of S. America, California, Australia and Russia. The alloy of osmium and iridium (osmiridium) provides tips for gold fountain-pen nibs. Discovered by Tennant in 1803.

Osmosis, the process by which absorption of liquids through semi-permeable membranes takes place. A solution exerts osmotic pressure (O.P.) or suction in proportion to concentration but also depending on kind of dissolved substance. The roots of the higher plants are covered with fine root-hairs, within the cell-walls of which the sap is normally of a higher concentration than the dissolved matter in the surrounding soil. The root-hairs, therefore, draw into themselves these weaker salt-solutions. (The explanation of water and salt exchanges is complicated by the selective ability of some cells (*e.g.*, roots) to accept or reject particular dissolved substances along with the water. The absorption of salts by a plant is selective, each plant selecting through the semi-permeable membranes of its root-hairs those substances which are most suited to it.)

Osprey (*Pandion haliaëtus*), a large and magnificent bird of prey, dark brown above and nearly white below. The head is whitish with a dark band from eye to nape. To the British Isles it is a rare passage migrant. Back in 1955, thanks to the energy of the Royal Society for the Protection of Birds, a pair nested in a Scots pine in Inverness-shire and reared three young. Since then many more ospreys have fledged. Food consists almost entirely of fish, which the bird seizes with its talons. The so-called osprey plumes in fact come from the egret. Ospreys are found on all continents except Antarctica.

Ostrich, the largest living bird, related to the rhea, emu and extinct moa, now found only on the sandy plains of Africa and parts of S.W. Asia. The male has beautiful white plumes on wings and tail. The wings are useless in flight, but the birds have a speed exceeding that of the swiftest horse. An ostrich's egg weighs 1·3 kg. The idea that ostriches bury their heads in the sand comes from an optical illusion.

Otary, any seal which has external ears (as opposed to the *true seals* which lack them). The eared seals make up the family *Otariidae*, which includes the Sea-lion and the Fur-seal.

Otter, an aquatic carnivorous mammal widely distributed over Europe, and until the 1950s very common in England and Wales. The otter averages about 60 cm in length, exclusive of tail, has web-feet and is a very expert swimmer. Otters are harmless and their hunting is a cruel and senseless blood sport. Having almost disappeared by 1980, the otter is now protected by the 1981 Wildlife and Countryside Act. By 2011 the otter had returned to every English county. Indeed, it is now more numerous than at any time since the Second World War (much to the dismay of some anglers). The Otter Trust is based at Earsham near Bungay, Suffolk. Otters have the densest fur in the animal world and also have unique throat markings.

There are 13 species of otter, but only the Eurasian *Lutra lutra* is native to Britain. An otter's den is called a holt or pouch.

Ounce or **Snow Leopard,** a very beautiful pale spotted cat from the Himalayas the size of a labrador retriever but with a long furry tail. They are hunted for their pelts. Only c. 3,500 are now left across all of central Asia, with only 300 in Nepal.

Outcrop. Where a bed of rock appears at the surface of the ground, there is an outcrop of the particular rock. The mining of outcrop coal is called open-cast mining.

Oviparous, a term referring to animals which lay eggs to be hatched outside the body of the parent.

Ovipositor, the organ by means of which female insects lay their eggs.

Owls, nocturnal birds of prey, will 240 species found everywhere except Antarctica. Their forward-looking eyes, embedded in rings of feathers, give them a characteristic "owl-like" appearance, and their plumage, usually a mottled blend of browns and greys, is so soft that their flight is almost noiseless. Their unique downy wings allow them to fly silently. Owls live on small mammals, reptiles, birds, insects and fish, and are very valuable birds to the farmer. British owls include the barn owl (screech owl), short-eared owl, long- eared owl, tawny owl and little owl (introduced to Britain in the 19th century by landowners).

Ox, the popular name of the mammals included in the genus *Bos*. They are hollow-horned ruminants and hoofed quadrupeds, there are *c.* 240 species globally, to be found on every continent except Antarctica and include the various classes of domestic cattle as well as the different wild species. The adult male is called a bull, the female a cow and the young a calf. The best-known breeds of domesticated cattle are the Durham or Shorthorn, the Angus, the Jersey, Ayrshire, Suffolk and Hereford.

Oxalic Acid, an organic acid obtained from numerous plants, such as sorrel and rhubarb, and produced artificially for commercial purposes from sawdust, treated with caustic potash or caustic soda. It combines with metals to form oxalates; used in the manufacture of ink.

Oxford Clay, a geological formation consisting of a bed of blue clay *c.* 200 m thick, and forming the lower portion of the Upper Jurassic. It makes good bricks.

Oxford University. There was a school at Oxford as early as 1115 and it is known that Robert Pullen, a theologian from Paris, lectured there in 1133. Allusions to Oxford as the most celebrated centre of learning in England occurred in a work of Gerald of Wales in 1184–5. Early foundations were University College (1249), Balliol (about 1263), Merton (1264). In 1571 the university was reorganised and granted a Charter of Incorporation.

Other colleges and halls with their dates of foundation incude: All Souls (1438), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1314), Hertford (1874), Jesus (1571), Keble (1868), Linacre (1962), Lincoln (1427), Magdalen (1458), New College (1379), Nuffield (1937), Oriel (1326), Pembroke (1624), Queen's (1340), St. Anthony's (1950), St. Catherine's (1962), St. Cross (1965), St. Edmund Hall (1270), St. John's (1555), St. Peter's (1929), St. Stephen's House (1876), Trinity (1554), Wadham (1612), Wolfson (1965), Worcester (1714), Campion Hall (1962), St. Benet's Hall (1964), Mansfield (1886), Regent's Park (1958), Templeton (1984), Harris Manchester College (1990), Kellogg College (1990, formerly Rewley House) and Wycliffe Hall (1996). The most recent foundation is the merged Green Templeton College (2008).

The original women's colleges were:— Lady Margaret Hall (1878), Somerville (1879), St. Hugh's (1886), St. Hilda's (1893) and St. Anne's (1952). Women were not admitted to degrees (though allowed to sit for examination) till 1920.

The last women-only college was St Hilda's (which finally agreed to admit men in 2006). St Benet's had no women undergraduates until 2016.

Oxygen is the most abundant of all terrestrial elements, no. 8, symbol O. In combination, this gaseous element forms about 46% of the earth's crust; one-fifth of the atmosphere; eight-ninths by weight of all water. Discovered independently by Scheele (*c.* 1773) and Priestley (1774). It is colourless, tasteless and odourless, and forms the chief life-supporting element of our world.

Oxyrhynchus Papyri, the famous hoard of 500,000 documentary fragments unearthed over 100 years ago in central Egypt. Many contain writings from famous authors such as Sophocles, Euripides, Hesiod *etc.*, lost for millennia. The fragments are now housed in the Sackler Library in Oxford.

Oyster, a bivalve mollusc, of the genus *Ostrea*, having very numerous species and abounding in nearly all seas. The shell is rough and irregular. They filter up to 50 gallons of sea water daily. Oysters are exceedingly prolific, spawning in May and June. The Whitstable oyster beds have existed since pre-Roman times.

The famous Delaware Bay oysters have been around for at least 450 million years.

Oystercatcher, a wading bird with black and white plumage and long, orange bill, inhabiting estuaries and sea-shores. Feeds on mussels, shell fish, *etc.*, but not oysters. They can be found on the banks of the Thames.

Ozone, a modified form of oxygen, containing three atoms of oxygen per molecule instead of two. It is prepared by passing oxygen through a silent electric discharge. When present in air to the extent of 1 part in 4 million parts of air it kills bacteria, and has been used for this purpose in ventilating systems, *e.g.*, that of underground railways. It is present in extremely small quantities in the lower atmosphere (*q.v.*) but is comparatively plentiful at heights between 12 and 50 km.

As ozone absorbs ultraviolet light of certain wavelengths, spectroscopic methods, involving the analysis of sunlight, are chiefly used in ozone determination.

P

Paca, a genus of large rodents found in Central and South America, and resembling the guinea-pig. It is of nocturnal habits, has streaked and spotted fur and lives on fruits and plants.

Pacific Ocean. The first European to recognise the Pacific as distinct from the Atlantic was the Spanish explorer, Vasco Nuñez de Balboa, who discovered its eastern shore from a peak in Panama in 1513. The first European to sail upon it was Magellan, who entered it by the strait that bears his name in 1520 Drake was the first Englishman to sail upon it in 1577.

The world's greatest known ocean depth is in the Mindanao Trench, off the Philippines, 37,782 ft (11,524 m). A thriving community of microbes was found there in 2013 the deepest living organisms yet discovered.

Pagan, *See* **Paganism, Section J.**

Pagoda, the name given in China, India *etc.* to a high pyramidal tower, usually, but not necessarily, connected with a temple.

Palaeontology, the science which is devoted to the investigation of fossils: animal (palaeozoology) and plants (palaeobotany). By studying the markings and fossils of living things in the stratified rocks, palaeontologists have been able to establish with astonishing accuracy a record of the evolution of life through geological time. The geologist at the same time with the evidence of the fossils has been able to work out the order and the age of the rocks. *See also* **Section T.**

Palimpsests are ancient MSS. or parchments which have been partly effaced and used for fresh writings. Many valuable MSS. were thus lost, but sometimes the second writing has been washed out, enabling the original writings to be deciphered. Among such restorations are a dialogue of Cicero's, a part of a book of Livy.

Palladium, a scarce metallic element, no. 46, symbol Pd, similar to platinum, with which it is usually found. It is an expensive metal, with desirable properties as a catalyst in reactions involving hydrogen, since it has a remarkable capacity for absorbing this gas; for example, coal gas and air will inflame in the presence of palladium at room temperature. It forms a silver-white alloy with gold, and this is used in some kinds of jewellery. It is used in expensive watches to make non-magnetic springs but its main use is in catalytic converters. Russia is the world's largest producer.

Pallium, a vestmental ornamentation of white wool presented by the Pope to new archbishops.

Palm, a large straight-trunked plant or tree common to tropical countries, and usually fruit yielding, such as dates, coconuts, *etc.* Many commodities useful to man are obtained from plants of the Palm family (*Palmaceae*). New palm oil plantations are clearing huge swathes of rain forest to make way for this profitable cash crop.

Palm Sunday, the Sunday before Easter, upon which occasion it is customary to carry palms to the churches in some countries, in commemoration of Christ's entry into Jerusalem for the Feast of the Passover, when the people went to greet Him with palm branches.

Panama Canal. In 1903 the United States signed a treaty with Panama (which had previously seceded from Columbia) which gave the United States rights in perpetuity over a 16 km-wide strip of land extending across the isthmus for the purposes of building and running the canal.

The canal connects the Atlantic and Pacific Oceans, is just over 80 kilometres long (with sea approaches) and the depth varies from 12 to 26 m. It is constructed above sea-level, with locks, and has been available for commercial shipping since 3 August 1914. Under the agreement reached in 1978 the USA formally returned the canal to Panama in December 1999. The biggest expansion of the canal since its opening was completed in 2016.

Panda, *or* **Cat-Bear,** is related to the Raccoon. There are two kinds, the Red or True Panda, resembling a large domestic cat, which lives in the eastern Himalayas and S.W. China, and the Giant Panda, which is more like a bear in appearance and inhabits the mountains of western China. Both frequent the dense bamboo forests of those regions. Today around 2,000 giant pandas survive in the wild in China, but numbers are rising. The famous Wolong Panda Reserve is in Sichuan Province in China.

The secretive courtship and mating of pandas has now been filmed—male pandas make loud yelping and barking noises to scare off potential competitors! Female pandas are receptive to mating for only 36 hours a year. Pandas can survive on shoots and leaves by expending very small amounts of energy.

Pangaea. The original vast continent on Earth.

Pangolin, the scientific name of the "scaly anteater", a toothless mammal, found in W. Africa and S.E. Asia. It has a long extensible tongue which it uses in catching ants and termites, its chief food. When attacked the pangolin rolls itself into a ball, and its scales assume the form of sharp spikes.

Pangolins have an Order of their own the *Pholidota*, the scale-bearers. The animal is now threatened with extinction by hunting not just for meat but for their scales and body parts in Asia.

Pantagruel, the leading character in one of the satires of Rabelais.

Pantheon, the famous temple in Rome, originally consecrated to the gods, built by Agrippa in 27 B.C. and rebuilt in the 2nd cent. by Hadrian. Its splendid dome and portico make it one of the most interesting architectural monuments of ancient days. Since the 7th cent. it has been used as a Christian church. One theory suggests the Pantheon was originally a colossal sun dial.

Panther, another name for the leopard, *Panthera pardus*, related to the lion, carnivorous, active climber, found in India, and other parts of Asia, also in Africa.

Paper has been known in one form or another from very early times. As early as 3,500 B.C., the papyrus reeds of the Nile swamps served the ancient Egyptians for sheets upon which to inscribe their records. Almost all surviving Greek and Roman literature is written on this. The Chinese and Japanese, centuries later, were using something more akin to modern paper in substance, an Asiatic paper-mulberry, yielding a smooth fibrous material, being utilised.

With the spread of learning in Western Europe the necessity of a readier medium made itself felt and paper began to be manufactured from pulped rags and other substances. The first known English paper-mill was Sele mill near Stevenage, built about 1490, which produced the paper for an edition of Chaucer in 1498. Other mills were set up under Elizabeth, using linen and cotton as raw material. Other papermaking staples were later introduced, such as surat, wood-pulp *etc*. Bleaching of paper with chlorine was invented in 1774.

The chief raw material in the paper industry is wood-pulp, the main exporters being Canada, Sweden and Finland. Canada is the world's chief producer of newsprint.

Papyrus, the earliest known paper made in Egypt at a very remote period from a tall species of reed, *Cyperus papyrus*. This plant is to be found all over tropical Africa, especially in the "sudd" region of the White Nile. *See also* **Codex**.

Parachute, the umbrella-shaped safety device used in emergency by the crew and passengers of aircraft. The first parachute descent from a great height was made in 1797 by André Garnerin who dropped 915 m from a balloon. Rate of descent for a parachute jump is *c*. 5 m/s.

Paraffin, a mixture of hydrocarbons of higher boiling point than petrol. Paraffin was first obtained by distillation of coal, the process being discovered about 1830. About 1848, James Young procured it from mineral oil, and Irish peat also yielded it. The main source of paraffin supply today is crude petroleum. Used in the manufacture of candles, for waterproofing and numerous other purposes.

Parakeets, various small parrots of vivid plumage native to Australia, Polynesia, Asia and Africa. One of the loveliest of the parakeets is the budgerigar of Australia. They tend to travel in large flocks in the wild. Their diet consists of fruit, nuts and berries. They were introduced to England in 1840. Their population is now booming, especially in South-East England. The bright green ring-necked parakeet is now Britain's only wild parrot. They are having a significant impact on our native birds.

Parallax, the change in direction of a body caused by a change in position of the observer. If the parallax is measured (in degrees of angle) and the distance between the two observation points is known the distance of the observed body can be calculated. The distance of heavenly bodies has been found this way. The first stellar distances were so obtained in 1838 by Henderson, Struve and Bessel. Stellar distances are so great that even when the two observations are made at opposite points of the earth's orbit round the sun, the parallax is always less than 1·0″ of arc. *See* **Aberration.**

Parameter, a number which is fixed for the application of a theory to one particular situation but may be different for other situations. For example, in a theory of motion near the surface of a planet the acceleration due to gravity may be regarded as a parameter constant for a particular planet but differing from planet to planet.

Parchment, made chiefly from the skins of animals, usually of goats and sheep, was employed in olden times before printing was invented and superseded papyrus as writing material. Vegetable parchment, invented by W. E. Gaine in 1853, though not equal in strength and durability to skin parchment, is about five times stronger than ordinary paper. Vellum is parchment made from the skins of young calves or lambs.

Parquetry, the name of a style of flooring consisting of small rectangular wooden blocks laid down according to geometrical pattern.

Parrot, the popular name of a widely distributed family of tropical birds, including the African grey parrot, the green parrot of South America —both familiar cage pets in this country—and also the various parakeets, cockatoos, macaws, *etc*.

Many of these birds possess a remarkable gift of imitating sound, especially human voices. Of the 330 remaining parrot species in the world, conservationists have warned that 89 could disappear, through habitat destruction, hunting for food and the demands of the pet trade.

Parsec, modern unit of astronomical distance, particularly for distances beyond the solar system. One parsec equals 206,265 Astronomical Units (AU), and 3·26 light-years. *See* **Astronomical Unit, Light-year**.

Parthenogenesis. The development of animals from unfertilised eggs. The drones of the honey bee are parthenogenetic, and the phenomenon is also common among aphids.

Parthenon, the famous Temple of Athena on the Acropolis at Athens, was built under the rule of Pericles between 447 B.C. and 432 B.C. It was made wholly of marble without mortar. The famous sculptured friezes, known as the Elgin Marbles, are now in the British Museum. It is now believed the Parthenon was once painted with splashes of colour.

Particulates, microscopic specks of acids and chemicals in the atmosphere. When inhaled into the lungs (*e.g.* from vehicle emissions) they can cause serious health problems.

Partisans. Term originating with the Russians who raided French supply lines on Napoleon's 1812 Moscow campaign; now used generally to refer to armed bands offering resistance behind enemy lines. In World War II it took on a specifically left-wing connotation when Stalin urged partisan activities in German-occupied Russian territory in 1941 42. At the same time communist-led partisan bands were formed in Albania, Slovakia and Greece. In Yugoslavia the communists led by Tito styled themselves 'partisans' in July 1941.

Partridge, a well-known British game-bird. Two species are found in Britain, but numbers are falling rapidly, partly due to pesticides.

Passport is an official document issued to a person by his own government, certifying to his citizenship and permitting him to travel abroad. Passports to British subjects issued by the United Kingdom Passport Agency (under the control of the Home Office) authorise the bearer to leave the country and guarantee him or her the state's protection.

Renewal passports at present cost £72·50—and are issued for a period of 10 years. Children under 16 now require separate passports (costing £46·00). For those making more frequent visits abroad a 94-page passport, first issued in 1973, can be obtained. Fast-track passports (processed in just one week) are more expensive (£103).

Free standard 32-page passports for those born on or before 2 September 1929 began in 2004.

From 1988, British citizens began using a common wine-coloured EU passport. Existing blue passports remained valid until 1999. The old one-year British visitor's passport and the British Excursion Document (used by short-stay visitors to France) were abolished from early 1996. To facilitate obtaining a 10-year passport, an application can now be handed in at any post office (for a small extra charge).

The main passport office is at 2 Marsham Street, London, SWIP 4DF. The Passport Advice Line number is 0300 222 0000.

Over 49 million British citizens hold a passport and 6 million are issued annually. Passports in future will have biometric (*q.v.*) details added.

Since 2006 adults applying for a passport for the first time have had to do so in person.

***pC* Value,** introduced by Dr. C. L. Whittles in 1935 as a measure of salinity of aqueous solutions (soil extract, irrigation water, *etc.*); defined as the negative logarithm of specific electrical conductivity in reciprocal ohms. Alone or joined with *pH* (*q.v.*) is useful as an index of osmotic pressure (*see* **Osmosis**) and related hindrance to plant growth resulting from excess of fertiliser or soil salts. If manuring is balanced, growth is best about *pC* 3·3.

Peacock, a bird of large size and beautiful plumage, its characteristic feature being a tail of brilliant "eyed" feathers, which it can erect and spread out, the males possessing resplendent feathering to a much greater extent than the females. It is related to the pheasant; one species is found wild in the forests of India, and another inhabits Burma and the Malaysian regions. In Africa there is the Congo Peacock.

Peanut, Groundnut *or* **Monkey Nut.** A member of the pea family native to S. America, but now cultivated in many parts of the world. After pollination, the flower stalk bends down and buries the pod containing the peas ("nuts") in the ground. The oil from these "nuts" can be used for margarine manufacture.

Pearl is produced by certain shelled molluscs, chiefly the oyster. The inner surface of the shells of the pearl oyster yield "mother-ofpearl", and distinct pearls are believed to be morbid secretions, caused by some external irritation. Many fine pearls are found in the actual body of the oyster. The Persian Gulf, Sri Lanka, the northwest coast of Western Australia, many Pacific islands and the Gulf of Mexico are among the most productive pearlfishing grounds. In ancient times Britain was renowned for its pearl fisheries, the pearls being obtained from a species of freshwater mussel. Western Australia has produced a 40-grain pearl, the finest the world has seen.

The largest pearl ever found was the "Beresford-Hope Pearl", which weighed 1,800 grains.

Peat, decayed vegetable matter found mostly in marshy positions, and common in Ireland and Scotland. Peat is coal in its first stage of development; burnt for fuel in many cottages.

Peccary, a pig-like animal native to the Americas. There are two species: the collared peccary and the white-lipped peccary, the latter being in danger of extinction.

Peewit. Another name for the green plover or northern lapwing.

Pelican, a genus of bird with long depressed bill pouched underneath, thus able to hold fish in reserve. It has immense wings and webbed feet. There are eight species.

Pemmican, venison or other meat, sliced, dried, pounded and made into cakes, used by explorers and others when out of reach of fresh meat.

Penguin, a genus of flightless, fish-eating sea-birds of the southern hemisphere. They are stoutbodied, short-necked and of small, moderate or large size. The Emperor and King Penguins make no nest but protect and incubate the single egg by carrying it in the down feathers between the feet and the body. Other species brood in the usual way and may lay up to three eggs. Penguins use their flippers for swimming under water. All 18 species are bluish-grey or blackish above and white below. They are very sociable and breed in colonies. They have more feathers than any other bird. The emperor penguins use a unique vocal 'identity code' to pick out their families.

All penguins live in the southern hemisphere, except for the Galapagos penguin which lives near the equator (the only penguin found in the tropics). Eleven penguin species (including Emperor penguins) are under threat (partly because melting ice is destroying their nest sites). Climate change also means longer foraging trips to feed themselves and their chicks.

It is now known that each penguin has a unique pattern of spots on its chest—as individual as human fingerprints.

The oldest penguin fossils (*c.* 12 million years old) have been found in South Africa, where penguins can still be found.

Penny Black, the most famous British postage stamp ever. It was the world's first adhesive postage stamp. In use, 6 May 1840 until Jan. 1841. Followed by the 'Twopenny Blue'. The first perforated stamp followed in 1854.

Pentagon, government office in Washington, housing the US Defence Department.

Pentaquark. *See* **Quark**.

Penumbra, the half shadow of the Earth or Moon during an eclipse. The term is also used to describe the lighter, outer part of a sunspot.

Pepys Diary, by Samuel Pepys, was first published in 1825. It gives a picture of the social life of the period 1 January 1660 to 31 May 1669. He bequeathed the manuscript, together with his library, to Magdalene College, Cambridge.

Perch, a well-known family of fresh-water fish, with dark striped sides. The common perch of British rivers and lakes falls an easy prey to the angler because of its voracity.

Peregrine. *See under* **Falcon.**

Perfumes are essences or odours obtained from floral and other substances. The chief flower perfumes are those obtained from rose, jasmine, orange flower, violet and acacia. Heliotrope perfume is largely obtained from vanilla and almonds. Among the aromatic herbs which yield attractive perfumes are the rosemary, thyme, geranium, lavender, *etc.*, while orange peel, citron peel, musk, sandalwood, patchouli and other vegetable products are largely drawn upon. Many of the popular perfumes of today are chemically prepared *See* **Musk Deer.**

Perigee, the closest point of the orbit of an object such as a satellite to the earth. The opposite of apogee (*q.v.*).

Perihelion. That point in a planet's orbit when it is nearest to the sun; opposite of aphelion. The earth is at perihelion ($1{\cdot}47 \times 10^8$ km) in midwinter, about 3 January.

Peripatus, an animal which stands as a link between the annelid worms and the arthropods. Wormlike with short unjointed legs it breathes by a system of air tubes like those in insects. Certain other points of internal structure point to a relationship with annelid worms.

There are some fifty species, the best known being the S. African *Peripatus capensis.*

Perjury, the offence of giving false evidence. The ancient Romans threw the perjurer from the Tarpeian Rock, and after the Empire was Christianised, those who swore falsely upon the Gospel had their tongues cut out. The usual punishment in England from the 16th to 19th cent. was the pillory, fine and prison.

Permian Formation, a group of rocks lying between the Trias and the Carboniferous strata. It has three subdivisions, Upper, Middle and Lower.

Per Procurationem signature means that the subject of the correspondence has been put into the writer's care by his principal for him to use his personal judgment in the matter, and that he is authorised to sign on behalf of his principal. Normally contracted to *per pro* or *p.p.*

Perseids, a major meteorite shower, maximizing on 12 Aug. The shower has been regularly observed since the 19th century. First recorded in A.D. 36.

Peruke, the name given to the wigs worn by men in the latter half of the 18th cent. Wigs are still worn by the Speaker of the House of Commons, judges and barristers (though now only in criminal courts, not family or civil cases). Wigs are not worn in the Supreme Court.

Petrel, the name given to a member of a large, widely-distributed family of sea-birds of great diversity of size and colouring and distinguished by tube-like external nostrils. They usually skim low over the waves, and some, for this reason, are known as shearwaters. The storm petrel or Mother Carey's chicken occasionally patters along the surface, and is often called Little Peter—a reference to St. Peter walking on the water. Except when breeding, petrels are always at sea. They mostly nest in holes and crevices on islands and lay one egg, which is invariably white. The storm petrel, Leach's petrel, Manx shearwater and the fulmar petrel are resident in the UK. *See also* **Mutton Bird.**

Petroleum. *See* **Oil.**

Pewter, alloy of tin and lead formerly used for making household utensils and ornaments.

***pH* Value.** Introduced in 1909 by the Danish chemist Sørensen to indicate hydrogen-ion concentration on the basis of electrical conductivity and a view of ionisation since discarded; is now taken as a logarithmic scale of acidity or alkalinity of aqueous solutions: acidity 0–7, neutrality at 7·0, alkalinity 7–14. The *pH* of blood is 7·35°–7·45° (faintly alkaline).

Phage. *See* **Bacteriophage.**

Phalanger, pouched marsupial mammals. They are arboreal and superficially resemble squirrels. There are two genera of flying phalangers or flying squirrels, which have a remarkable membrane along each side of the body enabling the animals to glide through the air. The members of the phalanger family are confined to the Australasian and Asian regions.

Phalangid, a member of the arachnid family Phalangida: popularly known as "harvesters".

Phalanx, a name applied by the ancient Greeks to a body of pike-men drawn up in close array, with overlapping shields, and eight, ten or more rows deep. The Macedonians stood 16 rows deep. As many as 500 men could be in the front row.

Pharos, the name of the first lighthouse, built by Ptolemy II *c.* 280 B.C., on the Isle of Pharos, at the entrance to the harbour of Alexandria. It was said to be 180 m high. One of the "seven wonders" of the ancient world.

Pheasant. They are birds related to the partridges, quails, peacocks, chickens and turkeys, males distinguished by their brilliant plumage and long tapering tail. First found by the Greeks in Georgia where the River Phasis flows through to the Black Sea. It has remarkably powerful muscles for take-off, but its flight is cumbersome.

Phillippics, the oration delivered by Demosthenes, 352–341 B.C., against Philip of Macedon—remarkable for their bitter invective. The word was also used for Cicero's speeches against Antony.

Phoebe, the outermost moon of Saturn, thought to have begun life as an icy comet.

Phosphorus is a non-metal element, no. 15, symbol P. Most familiar as a waxy, yellow solid which is spontaneously inflammable in air. It has chemical similarities to arsenic, like which it is very poisonous. It was discovered by Brandt in urine in 1669. It is found in most animal and vegetable tissues. It is an essential element of all plants and of the bones of animals. In combination with various metals it forms different phosphates, which are largely utilised as manures. The chief commercial use of phosphorus is in the preparation of matches.

Photoelectric Cell, a device which gives a useful electrical response to light falling on it. There are several kinds depending on the different effects which light may have on a suitably chosen solid (usually a semiconductor), *viz.*, the emission of electrons from the surface ("photoemissive cell"); change in electrical resistance ("photoconducting cell"); generation of electric current from a specially designed sensitive structure ("barrier layer" or "photovoltaic cell", "solar battery").

Different cells respond differently to lights of various wavelength and must be chosen for each application. *See also* **Solar Battery.**

Photogrammetry, the science of measurement from photographs taken from an aircraft.

Photon. When light behaves like a stream of discrete particles and not like waves, the particles are called photons. *See* **Section T.**

Photosynthesis. *See* **Section T.**

Phylloxera, a genus of plant-lice related to the aphids, which attacks the grape vine. Many vineyards of France, in common with the rest of Europe, were replanted with native vines grafted on immune stocks from California in 1879 after being ravaged by the insect (which came from America). Curiously enough, the remedy also came from America, the vine stocks there being immune to phylloxera.

Phytoplankton, tiny marine plants that live in the upper layers of the sea.

Pi is the unique number denoted by the Greek letter π and obtained by dividing the length of the circumference of any circle by its diameter. Its value is approximately 3·14159. It remains one of the most fascinating figures in mathematics.

Picts, inhabitants of Scotland in pre-Roman times, are held by some historians to be a branch of the old Celtic race, by others to have been of Scythian origin. They occupied the north-eastern portion of Scotland, and were subdued by the Scots in Argyll in the 9th cent., Kenneth MacAlpin becoming king of a united kingdom of the Picts and Scots—the kingdom of Alban.

Pike, a familiar fresh-water fish abundant in the temperate regions of both hemispheres. It forms good sport for the angler in rivers and lakes, and sometimes attains a weight of from 9–13 kg. It is extremely voracious, is covered with small scales and has a ferocious-looking head.

Pilchard, a fish of the herring family, but with smaller scales and more rounded body. It used to appear off the Cornish coasts in vast shoals, but over-fishing has led to a decline. They are now usually known as Cornish sardines. Climate warming may bring pilchards to the North Sea.

Pilgrimage. The undertaking of a journey to a religious place or shrine. An early recorded pilgrimage is that of the Empress Helena to Jerusalem in 326. In the Middle Ages pilgrimages became common, and were undertaken by monarchs and people of rank in all Christian countries. Muslims have been making pilgrimages to Mecca (the *Hajj*) since the death of the Prophet, as required by the Koran.

Pillar Boxes (Post Boxes). The first post box in Britain was in Jersey. The first standard red box appeared in London in July 1874 (earlier standard boxes had been green). There are *c.* 115,000 UK pillar boxes.

Pillory, a wooden instrument of punishment in use in England until 1837. It consisted of a pair of movable boards with holes through which the culprit's head and hands were put, and was usually erected on a scaffold. While a person was undergoing this punishment the mob generally pelted him with stones and rubbish, sometimes to his serious injury. People convicted of forgery, perjury or libel were often condemned to the pillory, but from 1816–1837 the only offence for which it could be inflicted was perjury.

Piltdown Man, a fossilised skull and jawbone, apparently found in a Sussex gravel pit in 1912 by Charles Dawson. It was declared a fake in 1953 and is now known to have been the work of Dawson himself.

Pine, a conifer of the genus *Pinus*, which flourishes all over the northern hemisphere and includes 80 90 species, which afford valuable timber and yield turpentine and tar. The Scots Pine, *Pinus silvestris*, with its blue-green, short needles, set in pairs, and its rosy-orange branches, is native to Britain, as it is to the whole of Europe. It provides the red and yellow deal in everyday use.

Pine Marten. *See under* **Marten.**

Pipit. The most southerly songbird in the world.

Piracy, was at its height in the "Golden Age of Piracy" from 1650 to 1720. Among famous pirates is Blackbeard (his real name was Edward Teach) who terrorised the Caribbean from 1716 to 1718. Today piracy is rife off the coasts of West Africa and in the Straits of Malacca.

Pirarucu, the largest fish to be found in the Amazon.

Pitcairn Islanders were originally the mutineers of the *Bounty*. They took possession of the island in 1790, and it was not until 1814 that their whereabouts was ascertained, accidentally, by a passing ship. The mutineers, under their leader, Adams, had settled down to a communal existence, married Tahitian women and increased so in numbers that they were too many for the island to support, and in 1856 they were removed to Norfolk Island. A small number returned to Pitcairn.

Pitchblende *or* **Uraninite,** a relatively scarce mineral. It is nearly all uranium oxide, but lead, thorium, *etc.*, are also present. Pitchblende was the material in which radium was discovered by the Curies. Sources include the Great Lakes region of Canada.

Pitohui, a song-bird found in Papua New Guinea which produces a powerful nerve toxin.

Planemos, term for mini-stars, perhaps 100 times smaller than our own sun.

Planetarium, a complex optical system which projects into the interior of a dome a replica of all the phenomena of the sky that can be seen by the naked eye, *e.g.*, sun, moon, planets, *etc.*

Planets, the name given to such celestial bodies as revolve round the sun in elliptical orbits. The name was first used by the Greeks to indicate their difference from the fixed stars. There are eight *classical* planets, Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune. The term *inferior planets* refers to those whose orbits are nearer the sun than Earth's orbit.

Saturn, Uranus and Jupiter are ringed. Many important questions can be answered by means of probes sent to the neighbourhood of the planets. These include the measurement of the magnetic field, if any, of the planets, the study of their atmospheres *etc.* With instruments landed gently on the surface it is possible to investigate surface conditions and composition.

The US Mars probe *Mariner IV* pictures of the Martian surface in 1965, the Russian *Venus IV* in 1967 made a soft-landing on Venus, and the US *Pioneer 11* came within 43,000 km of Jupiter in December 1974. Two US *Voyager* spacecraft were launched in 1977 flying by Jupiter (1979), Saturn (1980, 1981) Uranus (1986) and Neptune (1989), sending back important new data. Exciting pictures were received in 1998 from the Hubble telescope of a planet outside our own solar system. By summer 2013 *c.*800 extra-solar planets had been detected by astronomers (some very similar to Earth). In the whole Milky Way there could be 10 billion planets capable of supporting life.

Recent decades have seen numerous exciting space missions, mainly to Mars (NASA's Mars Surveyor missions) and also Saturn (Cassini) and Pluto (New Horizons). The Cassini spacecraft is the biggest interplanetary spacecraft ever launched by NASA. In 2004 it arrived at Saturn and began conducting the most extensive survey to date of any planetary system. Cassini has released the Huygens probe into the atmosphere of Saturn's largest moon, Titan.

A gas-giant planet 3 times older than Earth and 800 times larger (near 37 Gem) was discovered in 2003. The first photograph of a planet (2M1207b) beyond our solar system was made in 2004. The largest known planet which orbits another star (TrES-4 in the constellation of Hercules) was discovered in 2008.

In 2011 a planet which orbits two suns (and has two sunsets) was found and in 2012 a planet-like object was found in the Oort Cloud at the edge of the Solar System.

For the new classification of *dwarf planets* and *plutoids*, *see* **T8–9**.

Plankton, a word which first came into biological use in 1886 to describe the usually microscopic plants and animals floating, swimming and drifting in the surface waters of the sea. To be distinguished from *nekton* (swimming animals like fishes and squids) and *benthos* (plants and animals living on the sea bottom, like fixed algae, sponges, *etc.*). Of great economic importance, providing food for fish and whales. They number billions of trillions, but are threatened by pesticides and pollution.

Plankton played a major role in the formation of Earth's first breathable air. And without Plankton there would be no fish in the sea.

Plants. *See* **Section T**.

Plasma Physics is the physics of wholly ionised gases, *i.e.*, gases in which the atoms initially present have lost practically the whole of the electrons that usually surround their nuclei, so that the gas consists of a mixture of two components, positively charged ions and negatively charged electrons. The physical properties of a *plasma* are very different from those of an unionised gas. In particular, a plasma has a high electrical conductivity and can carry large currents. *See also* **Nuclear Fusion.**

Plastics, a broad term covering those substances which become plastic when subjected to increased temperatures or pressures. The Plastics Industry is based on synthetic organic examples of this group. There are two classes of plastics: the *thermoplastic*, which become plastic every time they are heated (*e.g.* cellulosic plastics) and *thermosetting*, which undergo chemical change when heated, so that once set they cannot be rendered plastic again (*e.g.*, Bakelite). Plastics are composed of long-chained molecules, *e.g.*, polyethylene. Plastic is nearly indestructible.

Platinum, a metallic element, no. 78, symbol Pt. It is a scarce white metal generally allied with iridium, osmium, ruthenium and palladium. It can only be melted in an oxyhydrogen or electric furnace, but can be rolled out into a film-like sheet, or drawn out to the finest wire; being resistant to acids it is termed a noble metal. Named after the Spanish for "silver-coloured' –*platina*. First found in the sands of the River Pinto in S. America. Used in jewellery and catalytic converters. The world's largest producer is South Africa.

Platonic Solids, five regular solid figures known to the ancient world. They are: the tetrahedron (4 triangular faces), cube (6 square faces), octahedron (8 triangular faces), dodecahedron (12 five-sided faces), icosahedron (20 triangular faces). All the faces and angles of each solid are identical.

Platypus. *See under* **Duckbill**.

Pleiades, famous cluster of stars in the constellation of Taurus. Of the seven principal stars in the group, one is rather faint, and many myths have sprung up about this "lost Pleiad".

Pleistocene, the geological period that succeeded the Pliocene. During the Pleistocene, also known as the *Great Ice Age*, there were four cold periods, when the ice sheets covered northern Europe and N. America, separated by warm periods when the glaciers drew back into the mountains. The transition to Pleistocene took place *c.* 1,850,000 years ago.

Pliocene, the geological period preceding the Pleistocene, and the last major division of the Tertiary strata. It began fifteen million years ago.

Plover, wading birds, widely distributed over marshy places of Europe. Several species occur in Britain, including the Golden-plover, the Ringed plover, Kentish plover and Dotterel. There is now genetic evidence that the Kentish plover is not related to other plovers. Ringed plovers first nested in Britain in 1938.

Pluto, the last "planet" to be discovered was searched for following the 1914 predictions of P. Lowell and duly discovered by C. W. Tombaugh at the Flagstaff Observatory in Arizona in January 1930. Generally the most distant of the planets its orbit is much more elliptical than the other planetary orbits and so it sometimes approaches the sun closer than Neptune. It was thought to be different from the other outer Jovian planets which are gaseous and to consist of rock covered in frozen methane gas. The diameter of Pluto is 2370 km.

Pluto's largest moon, Charon, was detected in 1978 by earth-based telescopes using special photometric measurements. It is composed almost entirely of ice. Four further moons (Nix, Hydra, Kerberos and Styx) have been found. Images of the surface of Pluto reveal ragged icy polar caps and clusters of bright and dark features. Its atmosphere freezes in winters lasting 100 years.

Pluto was long considered the outermost planet of the solar system, but a new object, Sedna, was discovered in 2004, three times further from the earth. It was named Sedna after the Eskimo goddess of the seas. In 2006, Pluto, Sedna and other distant objects were renamed *dwarf planets* (*see* **T8–9**). There are many hundreds of Pluto-sized objects in the outer solar system. An even more distant planet-like object was discovered in the Oort Cloud in 2012.

For recent discoveries, *see* **T9**.

Plutonium, a chemical element, no. 94, symbol Pu, capable of nuclear fission in the same way as Uranium 235. Not until after it had been synthesised in atomic piles during the second world war was it shown to occur in infinitesimally small traces in nature. Its synthesis in the atomic pile depends on the capture by Uranium 238 nuclei of neutrons; immediate product of this reaction is the element neptunium, but this undergoes rapid radioactive disintegration to plutonium.

Pochard. One of Britain's most popular duck species, but now in decline.

Poet Laureate is the poet attached to the royal household, an office officially established in 1668, though its origins go back to the early Middle Ages, when minstrels were employed at the courts of English kings. Chaucer, Skelton and Spenser, though not court poets, were all unofficial poets laureate. Ben Jonson has been called the first "official laureate" (1616), but the office was not officially recognised until 1668, when Dryden was formally granted the office. It is customary for the poet laureate to write verse in celebration of events of national importance. The current Poet Laureate is Dame Carol Ann Duffy, the first woman (and the first Scot) to hold the post. The post (once for life, but now for 10 years) carries an annual stipend of £5,000 and 630 bottles of sherry.

Some famous holders have been John Dryden 1668–1689, Robert Southey 1813–1843, William Wordsworth 1843–1850, Alfred Tennyson 1850-1892, Alfred Austin 1896–1913, John Masefield 1930 1967, Cecil Day-Lewis 1968-1972. Sir John Betjeman 1972–1984, Ted Hughes 1984–1998 and Sir Andrew Motion 1999 2009.

Polar Bear. *See* **Bear.**

Polecat, an animal of a dark-brown colour, about 46 cm in length, exclusive of tail; the ears and face-markings are white or light brown. It is carnivorous and belongs to the weasel family.

Pole-Star is of the second magnitude, and the last in the tail of the Little Bear constellation. Being near the North pole of the heavens—never more than about one degree from due north–it always remains visible in the Northern hemisphere; hence its use as a guide to seamen.

Police, a regular force established for the preservation of law and order and the prevention and detection of crime. The powers they have vary from country to country and with the type of government; the more civilised and democratic the state, the less police intervention. England, compared with countries abroad, was slow to develop a police force, and it was not until 1829 that Sir Robert Peel's Metropolitan Police Act established a regular force for the metropolis, later legislation establishing county and borough forces maintained by local police authorities throughout England and Wales. Up to that time police duties were discharged by individual constables and watchmen appointed by local areas in England and Wales. In Scotland the City of Glasgow Police was formed in 1800.

The current structure in England and Wales is as follows:

1. County forces (currently 43).

2. Combined forces, covering more than one county.

3. The Metropolitan Police Authority (MPA), covering an area within a 15-mile (24-km) radius of Charing Cross, but excluding the City of London (since 2000 under the GLA).

4. The City of London Force under the Court of Common Council.

In Scotland, the 8 former police forces became the single Police Scotland on 1 April 2013.

In Northern Ireland, the Royal Ulster Constabulary (RUC) became the Police Service of Northern Ireland in 2001.

The 2,700 strong Ministry of Defence Police (MDP) guard military sites and the nuclear weapons bases.

Police ranks are: chief constable, assistant chief constable, chief superintendent, superintendent, chief inspector, inspector, sergeant and constable. In the Metropolitan Police area the chief officer is the Commissioner of Police of the Metropolis.

The 1994 Police and Magistrates Court Act changed the relationship between central government, police authorities and chief constables. The National Crime Squad (NCS) to tackle organised crime was launched in April 1998. In 1997 Britain ratified the treaty creating Europol (the first EU country to do so). In 2004 the Independent Police Complaints Commission (IPCC) replaced the Police Complaints Authority. This in turn was renamed in 2016 as the Office for Police Conduct and its powers enhanced.

The problem of racism in the police force is currently of particular concern. Recruitment for the police among ethnic minorities is also now a priority to achieve a balanced force. The police have also been brought within the provisions of the Race Relations Act and civilians will head police complaint inquiries. Britain's first black chief constable was appointed in 2003 (to head the Kent force). In 2016, however all 43 heads of the police forces in England and Wales were white.

The first 41 elections in England and Wales for Police and Crime Commissioners (outside London) were held in 2012. They were marked by considerable apathy, The second elections were in 2016, when turnout rose to 25%. The National Crime Agency replaced the discredited Serious Organised Crime Agency in October 2013.

Poll Tax, common name for the Community Charge. It was replaced by the Council Tax from 1993.

Pollock, a white fish plentiful in seas off north Alaska. It has a similar texture to cod.

Polonium, a radioactive element, no. 84, symbol Po, discovered by Madame Curie in 1898, and named after her native land of Poland.

Polymerisation is the linking together of small molecules to make a large long-chain molecule. The general name for polymers of ethylene is Polythene, a wax-like plastic solid.

Pomegranate. A fleshy fruit whose juice has medicinal properties including management of blood sugar levels. There is evidence it delays the ageing process.

Pomology, the science of fruit-growing.

Pope, The, the head of the Roman Catholic Church, recognised by that Church as the lawful successor of St. Peter. He is elected by the body of Cardinals. After 1870, when the King of Italy deposed the holder from temporal power, no Pope left the Vatican between appointment and death until 1929, when peace was made between the Church and State in Italy. *See also* **G11**.

Population. *See under* **World Population, L117**.

Porphyry, a form of crystalline rock of many varieties that in ancient Egypt was quarried and used for the decorative portions of buildings and vessels. The term is applied generally to the eruptive rocks in which large well-formed crystals of one mineral are set in a matrix of other minerals.

Porpoise, a highly intelligent marine mammal of the dolphin and whale family, and a common inhabitant of northern seas. Porpoises travel in shoals, their progression being marked by constant leapings and plungings. Their average length is from 1·2–1·5 m. There are several species, nearly all confined to northern oceans. Porpoises are threatened by climate change and the illegal trade in their bladders.

Portreeve was an official appointed to superintend a port or harbour, and before the name of mayor was used for the chief magistrate of London.

Positron, the "positive electron", an atomic particle having the same mass but an electric charge equal but opposite to that of an electron. It was discovered in 1932. *See also* **Section T.**

Possum, an Australian mammal. The rare white possum is now threatened by global warming.

Post Office, The. This is now a State-owned Limited Company. Its corporate name was briefly changed to Consignia before becoming Royal Mail. In 2002 it announced over 15,000 job cuts amid a growing financial crisis. Meanwhile, the Post Office lost its monopoly of mail delivery on 1 January 2006. Closure of post offices is an area of public concern (their numbers declined from 25,000 in 1964 to only around 11,500 in 2017). The Coalition Government sold off most of the Royal Mail. The Royal Mail dates back to 1516.

Potassium, off a metal most of the, no. 19, symbol K (German *Kalium*). It is similar to sodium, reacting violently with water. It was discovered by Sir Humphry Davy in 1807, and is now generally obtained by the electrolysis of fused potassium hydroxide or chloride/fluoride mixture. Its principal minerals are caranallite and kainite, and it is relatively common in rocks, accounting for about 2½% of the earth's crust. An essential element for healthy plant growth; the ashes of plants are relatively rich in potassium. Potash is the common name for potassium compounds.

Potatoes. First cultivated in Peru *c.* 2,000 B.C. Brought to Europe following the Spanish conquest of the Incas (traditionally Sir Walter Raleigh is credited with introducing them to England). The sequencing of the DNA of the potato was completed in 2011, opening up the prospect of new and improved types.

Prado Gallery, the great public picture collection of Madrid, containing a superb collection of paintings by Velasquez, Murillo, Raphael, Titian, Dürer, Van Dyck, Rubens and Goya.

Prefect, chief magistrates in ancient Rome. The title is now applied to the chiefs of administration of the departments of France.

Premium Bonds. *See* **Ernie, L37**.

Printing by movable types was first used in Europe in 1454 by Johann Gutenberg, a citizen of Mainz (typeset books had been produced in China and Korea very much earlier). The invention is also claimed for Laurens Koster of Haarlem. It was introduced into England by Caxton, who set up a printing press in Westminster in 1476. Gothic characters were first used, being superseded by Roman letters in 1518. In 1798 Earl Stanhope replaced the wood printing press by one of iron.

In 1814 Friedrich Koenig applied the principle of steam power to the press. Mr. John Walter, of *The Times* newspaper, was the first to use the steam press. Improvements were introduced by Applegarth and Cowper in 1828 and great strides were made in 1858 when the Hoe machine was put on the market. Then came the Walter press in 1866 which printed on continuous rolls of paper from curved stereotyped plates. The Monotype machine casts single letters and the Linotype whole lines. The term letterpress is used for all printing methods using plates where the characters stand in *relief*. The other main printing methods are *intaglio* and *planographic*.

The development of computer technology has produced the biggest revolution in since Caxton.

Prion, a tiny micro-organism, one hundred times smaller than a virus.

Privatisation, selling of state-owned industries to private businesses and individuals, encouraged by the government after 1979 as part of its free market policies. Among the industries partly or wholly sold off were British Aerospace and Britoil (1983), British Telecom (1984) and British Gas (1986). Others included British Airways, British Coal and later British Rail. A further aspect of privatisation was the requirement of local authorities to contract out activities to private companies and the introduction of "internal markets" in the NHS.

The privatisation of the Tote was completed during 2011 and Royal Mail during 2015.

Privy Council, The is the Sovereign's own council, consisting of about 300 persons who have reached eminence in some branch of public affairs (Cabinet ministers must be Privy Counsellors), on whose advice and through which the Sovereign exercises his or her statutory and a number of prerogative powers. From it have sprung many organs of the constitution and many of our government departments have grown from committees of the Privy Council.

Thus the Judiciary or courts of justice have grown from the Sovereign's Council sitting as a Court of Justice, and today the Judicial Committee of the Privy Council is a body of distinguished lawyers acting as a Court of Appeal from courts of the Commonwealth.

Probation Officers are attached to particular Courts, sometimes a Magistrates' or a higher court. Sometimes an offender is not sentenced to punishment, but is released "on probation", that is on the condition that he behaves well and follows directions given by the Court or by a probation officer. The probation officer undertakes the "after care" of those released from prison or Young Offenders' Institutions. Parts of the probation service have now been privatised.

Productivity. Physical productivity is the output of products during a time unit, *e.g.*, so many products per man hour, or day, or year. Total productivity is the sum of all the units of product created during the given time.

Labour productivity is the part of the total that is attributed to labour as a factor of production. Productivity of capital is the element attributed to capital as a factor.

Productivity of land is the element attributed to the natural powers of the soil, as distinct from what is contributed by the application to it of capital or labour.

Prokaryotes. The first single-celled primitive life-forms to energe on Earth, *c.* 3·5 billion years ago.

Propane, a colourless inflammable gas made of carbon and hydrogen; formula C_3H_8. It is easily liquefied and transported liquid in cylinders and tanks. In this form it is familiar as a "portable gas supply" for domestic and industrial uses. It is sometimes mixed with butane for this purpose.

Propane occurs in natural gas and is a by-product of oil refining.

Proteins are the main chemical substances of living matter: they are a part of every living cell and are found in all animals and plants. All proteins are basically constructed of carbon hydrogen, oxygen and nitrogen, and some contain sulphur, phosphorus (nucleoproteins) and iron (haemoglobin). Proteins are built up of very long chains of amino-acids connected by amide linkages (the synthetic polymers such as "nylon" and casein plastics (from milk) are built up of the same linkages). The structure of protein molecules allows a variety of function. Enzymes, which bring about chemical reactions in living cells, are proteins having specific properties. *See also* **Section T.**

Proton, a basic constituent of the atomic nucleus, positively charged, having a mass about 1836 times that of the electron. It is a positive hydrogen ion.

Prout's Hypothesis. The English chemist William Prout (1785–1850) advanced the idea that all atoms are made of hydrogen, and their weights are exact multiples of the weight of a hydrogen atom.

With the modification that neutrons as well as protons occur in the nucleus, Prout's belief has been substantially vindicated.

Provost, a Scottish official similar in rank to an English mayor. The Provosts of Edinburgh, Glasgow, Aberdeen, Perth and Dundee are styled Lords Provost.

Ptarmigan, birds of the grouse family, one species of which inhabits the Scottish Highlands. In the winter the bird assumes a white plumage – the only British bird to turn completely white.

Ptomaines, amino acids produced during the putrefaction of proteins of animal origin. Not a cause of food poisoning, as was once generally supposed, which is almost invariably due to certain specific bacteria.

Publicans, under the Roman Empire, were people who farmed the public taxes. It is this class of officials that we find alluded to in the New Testament.

Public Corporations, statutory bodies which operated major industries and services in the public interest, *e.g.*, UK Atomic Energy Authority, Bank of England, BBC, Electricity Authorities, Gas Council, British Coal Corporation, British Steel Corporation, British Railways Board, the Post Office, British National Oil Corporation, British Nuclear Fuels, British Airports Authority. They were accountable to Parliament but their staffs were not civil servants. *See also* **Privatisation.**

Public Lending Right, a scheme established by Act of Parliament in 1979 which gives authors the legal right to receive remuneration from the government for the use by the public of their work through the public library system. Payments (*c.* £6·6 million each year) are now made to *c.* 22,000 authors, illustrators and other contributors. The scheme is now administered by the British Library.

Public Record Office. *See* **National Archives.**

Public Schools. The Public Schools Act of 1864 named nine "public" schools: Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St. Paul's and Merchant Taylors'. Today the term embraces many more, and can be applied to all those schools which belong to the Headmasters' Conference as distinct from the Headmasters' Association.

There are very many such schools in Britain, including such famous examples as Eton College (founded 1440), Harrow (1571), Uppingham (1584), Rugby (1567) and Sevenoaks (1418).

Public schools for girls include: Cheltenham Ladies' College (founded by Miss Beale in 1853), North London Collegiate School (founded by Miss Buss in 1850) and Roedean (1885).

Many public schools have become coeducational. Public Schools are now known as Independent Schools. In July 2000 a national code of boarding standards was set out, outlawing old-fashioned punishments and ceremonies.

Puffin, bird of the auk (*q.v.*) family. It has a large deep bill and is found in the N.E. Atlantic. In Britain, the largest colony is found on the archipelago of St Kilda, off the west coast of Scotland. Its young are called pufflings.

Pulsars. A regular pulsing of radiation which almost certainly comes from a swiftly rotating neutron star. The pulse of radiation ranges from around 1·6 milliseconds to 4 seconds. The radiation sweeps past the Earth in an identical manner to the flashes produced by a lighthouse lamp. Originally discovered at radio wavelengths, a few have been discovered in other wavebands.

Puma, mountain-lion or cougar, a large wild cat found throughout the Americas. It looks like a lean greyish lioness. The "lion of the Andes". It is now returning in the Rocky Mountains.

Putsch. A conspiracy to overthrow a regime by force. The term is often used of the abortive Kapp putsch of March 1920 in Germany.

Pyramids of Egypt, on the west bank of the Nile, are vast stone or brick-built structures with inner chambers and subterranean entrances, built by the Pharaohs as royal tombs and dating from about 2700 B.C. The most celebrated are at Gizeh built during the 4th dynasty. The largest, originally 147 m high, is called the Great Pyramid, one of the seven wonders of the world, built by the Pharaoh Khufu, better known as Cheops, and there he was buried, 100,000 men, according to Herodotus, being employed for 20 years upon it. Chephren, successor of Cheops, erected the second pyramid, and the third was built by Mycerinus, a son of Cheops. There is now increasing evidence that slaves did not build them.

The pyramid at Meidum built by King Snefru, founder of the 4th dynasty, is the most imposing of all. The Step Pyramid of King Djoser is believed to be Egypt's oldest pyramid. There are in fact more pyramids located in Sudan than in Egypt (where so far 118 have been found).

Over a dozen civilisations, notably the Mayans, Incas and Aztecs, also built pyramids (indeed the largest by volume is the Great Pyramid of Cholulu in Mexico). Peru has more pyramids than Egypt, especially in the Andes Valleys of northern Peru. A pyramid pre-dating those of Egypt has been found in Kazakhstan.

New satellite imaging techniques are discovering previously unknown pyramids in Egypt.

Pythons, large snakes, non-poisonous and destroying their prey by crushing it. Some species may reach 9 m in length, and prey upon deer and other small mammals. Found in Asia, Africa and Australia. They lay eggs.

Q

Quadrant, an astronomical instrument for measuring altitudes, superseded for navigational purposes in modern times by the sextant. It consists of a graduated arc of 90° with a movable radius for measuring angles on it.

Quagga, an extinct African animal, resembling a zebra from the front and a horse from the back.

Quai d'Orsay. An embankment in Paris where the French Foreign Office is situated.

Quail, an edible bird of the partridge family, of which only one species, the Common Quail, is found in England. It is not more than 20 cm long. It is found in most of the warmer regions of the world and is protected in England and Wales.

Quantum Theory. The rapid development of quantum theory has been almost entirely due to the experimental and theoretical study of the interactions between electromagnetic radiation and matter. One of the first steps was taken when it was discovered that the electrons emitted from metals due to the action of ultraviolet radiation have an energy which is not related to the intensity of the incident radiation, but is dependent on its wavelength. Einstein showed in 1905 that this could only be explained on the basis that energy is transferred between radiation and matter in finite amounts, or *quanta*, which are inversely proportional to wavelength. *See also* **Section T.**

Quarantine, the strict control of animals *etc.* to prevent rabies and other diseases entering the country. Dogs, cats and rabbits are eligible to enter under the Pet Travel Scheme from rabies-free countries.

Quarks are hypothetical subnuclear particles which were postulated by theoretical physicists concerned with the so-called elementary particles. There are believed to be six kinds of quarks. Quarks carry electrical charges which are fractions of those carried by familiar particles like electrons and protons. This and other special properties of quarks make them suitable for explaining the existence of the large number of other particles referred to in **Section T.**

In 2015 the *pentaquark* was discovered. It amounts to a new form of matter..

Quartering, in heraldry, is the disposition of various escutcheons or coats of arms in their proper "quarters" of the family shield, in such order as indicates the alliances with other families.

Quartermaster, a military officer charged with the provisioning and superintendence of soldiers in camp or barracks, and holding the equivalent rank to a lieutenant. The Quartermaster-General is an officer who presides over the provisioning department of the whole army.

A Quartermaster in the Navy is a petty officer responsible to the Officer of the Watch; at sea for the correct steering of the ship and in harbour for the running of the ship's routine.

Quarto, a sheet of paper folded twice to make four leaves, or eight pages; abbreviated to "4to".

Quartz is a common and usually colourless mineral, occurring both crystallised and massive. In the first form it is in hexagonal prisms, terminating in pyramids. When pure its specific gravity is 2·66. It is one of the constituents of granite, gneiss, *etc.* Among the quartz varieties are *rock crystal* (colourless), *smoky quartz* (yellow or brown), *amethyst* (purple), *rose quartz* (pink) and *milky quartz* (white).

Quartz veins in metamorphic rocks may yield rich deposits of gold. Mining for gold in the rock is termed *quartz-mining*.

Quasars, or in preferred terminology, quasi-stellar radio-sources, form a new class of astronomical objects, first identified in the period 1960 to 1962. They have enormous energy output, and are at vast distances. Many are strong sources of radio waves and fluctuate in intensity.

We now know that quasars propel out from feeding, super-massive, black holes to be found at the centre of most galaxies. Research on black holes is a key area in astronomy at the present time.

Queen Anne's Bounty, established by Queen Anne in 1704 for the augmentation of the maintenance of the poor clergy.

After 1 April 1948 Queen Anne's Bounty and the Ecclesiastical Commissioners ceased to exist and became embodied in the Church Commissioners for England.

Queen's (or **King's**) **Speech** is the speech prepared by the Government in consultation with the Queen and delivered in person or by her deputy, at the opening of a Parliamentary session.

Quetzal, a green bird with iridescent plumage, once revered as a god by the Aztecs.

Quicksilver. *See* **Mercury**.

Quince, a fruit belonging to the apple and pear family.

Quinoa, a grain-like food from the Andes, rich in energy.

Quirinal, one of the seven hills of Rome.

Quoll, a cat-sized animal with a dappled coat and bushy tail. Found in Australia.

Quorum, the number of members of any body or company necessary to be present at any meeting or commission before business can begin.

R

Rabbi, a Jewish term applied to specially ordained officials who pronounce upon questions of legal form and ritual, and also generally accorded to any Jewish scholar of eminence.

Rabbits, herbivorous burrowing mammals. In their wild state they have brownish fur and erect ears. They breed rapidly, having several litters a year. Decimated by the disease myxomatosis, they have been threatened by a deadly new disease RVHD (Rabbit Viral Haemorrhagic Disease), first reported in China in 1984. Rabbits can eat up to one-third of their body weight in a single evening. The 37 million rabbits in Britain are threatened with a return of myxomatosis. Popular breeds of pet rabbits are Flemish giant, dwarf lop and English spot.

Rabies, a virus infection affecting animals (*e.g.* dogs, foxes). Since strict quarantine laws in 1901, Britain has been free of rabies. Proposals for reviewing Britain's anti-rabies laws have recently been put forward.

Raccoon, plantigrade carnivorous mammals common to the American continent. There are several species. The common Raccoon (*Procyon lotor*) is about 60 cm long, with a bush ringed tail and sharp snout.

Race. Traditionally anthropologists have been concerned with the differences between the races of Man. Anthropology dismisses theories of a superior race as unscientific: there is not the slightest evidence that one race differs in any way from another in its psychological potentialities; Jews, Irish, Scots, *etc* do differ: but their differences are due to their situation and not to anything inborn.

Nowadays the term race is generally defined to refer to a group or category of persons connected by a common origin (*i.e.* ethnicity).

Raceme, an inflorescence in which the main stem bears stalked flowers, *e.g.*, lupin, foxglove. The youngest flowers at the tip of this axis.

Radar. The basic principle of radar is very similar to that of sight. We switch on a light in the dark, and we *see* an object because the light waves are reflected from it and return to our eye, which is able to detect them. Similarly, the radar station *sees* an object because the invisible radio waves sent out from the transmitter are reflected from it and return to the receiver, which is able to detect them. Thus radar is the use of radio signals that man broadcasts.

The utilisation of radio waves for the detection of reflecting surfaces began with the classical experiment of the late Sir Edward Appleton in 1925, which he conducted in order to demonstrate the existence of the Heaviside layer in the upper atmosphere. During the course of the last war developments took place which tremendously improved the methods and instruments used. As in the case of so many of the inventions primarily developed for the purpose of waging war, many useful applications have been found for radar in times of peace, and, in particular, it has proved of great service as an aid to aerial and marine navigation, and in meteorology, astronomy and even medicine. Radar astronomy investigates the cosmos with the echoes of signals sent out from the Earth.

Radiation, energy emitted in the form of a beam of rays or waves, *e.g.*, acoustic (sound) radiation from a loudspeaker, radiant heat from a fire, β-radiation from a radioactive substance. The radiation of electromagnetic waves from a body depends on its temperature, the amount of energy radiated per second being proportional to the fourth power of the absolute temperature. The hotter the body, the shorter the wavelengths of the radiation; thus the colour of a glowing body depends on its temperature.

Of paramount importance to us is radiation from the sun. Amongst other radiations, the sun sends ultra-violet, visible and infra-red (heat) waves. The principal gases of the atmosphere are transparent to practically all of the solar and sky radiation and also that which the earth re-transmits to space. Carbon dioxide and water vapour, however, strongly absorb certain types, the latter, as clouds, playing an important rôle in regulating the temperature of the globe. The cooling of the ground on a clear night is a result of the outgoing long-wave radiation exceeding that coming down from the sky; at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat.

Radiation, Cosmic. *See* **Section T, Part I.**

Radio. The theory of electromagnetic waves—of which the radio wave is one—was originated by the British physicist James Clerk Maxwell. He was able to show that both electrical and optical phenomena in space are essentially similar in character, and that the waves if short in wavelength are those of light, and if of longer wavelength those of radio waves.

Heinrich Hertz made many useful discoveries about the waves themselves, and about their behaviour under differing conditions, and about the apparatus for producing them. Marconi developed the practical use of radio waves. Analogue radio sets will be consigned to history by 2018, overtaken by digital.

Radio methods are vital for the transmission of observed data from space vehicles back to earth, a process known as "telemetering". This is done by converting the observations into electrical pulses which actuate a suitable radio transmitter so that it radiates a signal, in coded form, which can be received at a ground station and decoded. The transmission of such a signal can also be remotely controlled by means of signals from the earth. Photographic and television techniques may also be employed for obtaining the desired information and sending it back to earth, as in the case of the Russian picture of the reverse side of the moon and the American pictures of the lunar surface.

Data may be stored within the spacecraft for a time, and then, upon receipt of a particular radio signal from the earth transmitted by the spacecraft at a time convenient for its reception. Soviet scientists, by a special technique, were able in the case of their *Venus IV* probe (October 1967) to parachute an instrumented canister from the spacecraft so that it could descend slowly to the surface of the planet. Another breathtaking achievement was the transformation of the faintest of signals from a billion miles away into superb pictures of the planet Saturn and its rings *See also* **Radio Astronomy, Telemetry.**

Radioactivity is the spontaneous transformation of atomic nuclei, accompanied by the emission of ionising radiations. It was discovered in 1896 by Becquerel, who noticed that salts containing uranium sent off radiations which, like X-rays, can blacken a photographic plate.

Two years later Marie and Pierre Curie discovered several new chemical elements which possessed the same property, but many times more intense than uranium; the most important of these was radium. Shortly afterwards it was established, mainly by Rutherford, that three types of radiations called α-, β- and γ- rays, are emitted from radioactive substances.

It was also Rutherford who, jointly with Soddy, deduced that the emission of the radiations is associated with the spontaneous disin-tegration of atoms which result in the transfor-mation of one radioactive substance into another. A series of such transformations ends when a stable element is produced. All of the heavy radioactive elements can be arranged in three radioactive series, called, the uranium, thorium and actinium series. Initially, radioactivity was thought to be a property confined only to a few elements occurring in nature.

In 1934, however, Irene and Frederick Joliot-Curie discovered that ordinary elements can be transformed into radioactive forms by subjecting them to bombardment with α-particles. Following this, it was found that beams of other fast particles produced in accelerators can also render ordinary substances radioactive. Nowadays it is known that radioactivity is a general property of matter; any chemical element can be produced in one or more radioactive forms, or isotopes. *See* **Section T.**

Radio Astronomy. The science of radio astronomy makes use of radio apparatus and techniques for the observation of events occurring in far distant parts of the universe, and, in so doing, is able to enlarge upon the observational field of optical astronomy in a remarkable way. By means of radio telescopes it is possible to observe parts of the universe so far distant that the radio waves received have taken thousands of millions of years to travel from their source to the earth, and thus to observe happenings which may have occurred near the beginning of the history of the universe. Thus radio astronomy works with signals broadcast by objects in space.

There are two main types of radio telescope. The first, known as the interferometer, uses aerials spaced at large distances to obtain very high angular resolution. Indeed, the so-called very long baseline interferometers (VLBI) use receivers with separations of many thousands of km to obtain higher resolution than any optical telescope. The second, and "steerable", type, is that of the radio telescope at Jodrell Bank, Cheshire, which consists of an enormous concave metal bowl, with the radio aerials at its centre. This, though it has a lower "resolution", can be directed or "steered" on to any part of the sky which is above the horizon. The interferometers, particularly the VLBI, have been used to examine the fine structure of many objects, including the nuclei of large and unusual galaxies. The jet-like structures recently found in several galaxies are of particular interest.

As well as exploring the structure of gas clouds and clusters in our galaxy and in more distant ones, several of the large steerable telescopes have been used as radar antennae, for example to explore the surface of the cloud-covered Venus, and to locate suitable landing sites for the *Viking* spacecraft which explored Mars.

Alma (the Atacama Large Millimetre Submillimetre Array) in Chile opened in 2013. The world's largest radio telescope (known as Fast) was completed in China in 2016.

Radiocarbon Dating is a method of dating the origin of organic materials or objects by observing their radioactivity. It is of great importance to archaeology because it enables prehistoric dates back to about 50,000 B.C. to be established for animal and vegetable remains. It works because cosmic rays (*q.v.*) entering the atmosphere create neutrons which convert nitrogen in the air to radioactive carbon. This forms radioactive carbon dioxide and gets incorporated into animals and vegetables throughout the world along with ordinary carbon dioxide in a definite ratio, approximately 1 radio carbon atom to $0{\cdot}8 \times 10^{13}$ ordinary carbon atoms.

When the tissue dies it stops inter-changing its carbon with the atmosphere, *e.g.*, by breathing, and the radioactive carbon in it gradually turns into nitrogen emitting a β-particle (**Section T**). The radiocarbon content decreases by about 1% in 88 years. By measuring the proportion of radioactive carbon left in, say, dead wood, and comparing it with living wood, the age of the dead sample can be calculated in the laboratory.

It is now believed by scientists that the proportion of radioactive carbon in the atmosphere varied from time to time in the past because changes in the earth's magnetic field affected the cosmic rays. This has to be allowed for in calculating the radiocarbon date. One use of radiocarbon dating has been to trace the spread of agriculture through the world from its origin in the Near East *c.* 7000 B.C. *See* **Tree Rings.**

Radiosonde, a weather station in miniature carried aloft by a free balloon to heights normally in the neighbourhood of 16 km. Signals representative of values of atmospheric pressure, temperature and humidity are transmitted to ground receiving apparatus. The position of the balloon at any instant can be determined by radar, enabling the speed and direction of the upper winds to be deduced.

Radium, a radioactive metallic element, no. 88, symbol Ra, discovered by Marie and Pierre Curie in 1898. Atomic weight 226. Radiotherapy (use of X-rays from radium) is used to treat cancer.

Radon, a radioactive gaseous element, no. 86, symbol Rn, formed by radioactive decay of radium. Its discovery completed the series of elements known as the inert (or rare) gases. Radon has increasingly been linked to lung cancer.

Railways. In 1948 the railways of Britain were unified as British Railways (British Rail). Under the Transport Act 1962 the British Railways Board was set up to manage railway affairs. The most far-reaching change since 1955 has been the replacement of steam by electric and diesel.

Under Beeching the British Railways Board planned a viable railway system by closing uneconomic branch lines.

Under the Transport Act 1968 some railway passenger services became eligible for grants on social grounds, including urban railways and unprofitable rural services. High-speed inter-city passenger services came into operation in 1976 and in 1985 it was announced that the Advanced Passenger Train would go into production.

Following the 1993 Railways Act, the privatisation of British Rail began on 1 April 1994 when a new company, Railtrack, took over the management of the track, signalling and other infrastructure. In 1994, the government announced its intention to privatise Railtrack, which owned 2,500 stations and 11,000 miles of track. This took place in 1996. The first privatised rail services since 1948 began in February 1996.

In 2001, Railtrack collapsed, to be replaced in 2002 by Network Rail. In 2003, following widespread safety concerns, Network Rail took over maintenance work from private contractors. However, the future of Network Rail (now a state - owned corporation) is under consideration. A new 208 mph UK speed record was established by Eurostar in Kent in July 2003. Eurostar trains began using St. Pancras International from November 2007. Britain's first commuter high-speed train service (from Ashford to London) ran in December 2008. In 2009, plans were announced to electrify the London-Cardiff route and in 2012 plans to electrify the line from St. Pancras to Sheffield by 2023 were put forward. The first phase of the controversial HS2 line is due to be completed by 2026. A possible HS3 route has been proposed to link Liverpool, Manchester, Leeds and Hull. The number of rail journeys reached a record high in 2016, doubling in a decade.

Among railway facts are the following:

(1) the **highest** railway in the world runs from Beijing to Lhasa (in Tibet).
(2) the **straightest** is the 297-mile journey across the Nullabar Plain in Australia.
(3) the **longest** is the 6,346 mile route from Moscow to Pyongyang (in North Korea).
(4) the **fastest** speed achieved (currently *c.* 602 km/h) is by the Japanese Maglev train.
(5) the **busiest** railway station in the world is Shinjuku in Tokyo.
(6) the **longest railway tunnel** in the world (57·1 km) opened in 2016 in under Switzerland's Gothard Pass.

In 2013 the world's longest high-speed rail line opened in China. It links Guangzhou in the south with Beijing, the capital–a distance of 1,428 miles.

With 1½ million employees, Indian Railways is the largest employer in the world.

Rain. When moist air rises into lower temperatures and becomes saturated, condensation takes place on the numerous hygroscopic particles present in the atmosphere. If the temperature is above freezing a cloud of small droplets is formed. These droplets may then grow larger by coalescing with each other as they pass through the cloud until their weight is great enough to make them fall to the earth as rain. In clouds which extend above freezing level, snow and rain both form from the prefer-ential growth of ice crystals at the expense of liquid water droplets. If the resultant ice particle melts as it falls to earth, it gives rain: if not it gives snow. *See also* **Acid Rain**.

Rainbow, a beautiful colour effect visible to an observer with back to the sun and facing a rain shower, caused by the refraction and reflection of sunlight in minute water-droplets in the air. From high in the air it would be possible to see a rainbow as a complete circle, but from the ground the most that can be seen is a semi-circle when the sun is just on the horizon; the higher the sun is, the smaller the arc of the rainbow. When conditions are suitable two bows are seen, the secondary with the colours of the spectrum reversed.

The colours of the rainbow are seven; red, orange, yellow, green, blue, indigo and violet—the colours of the spectrum. *See also* **Aurora**.

Raingauge, an instrument consisting of a deep metal funnel whose stem dips into a graduated glass jar from which the depth of the rain water collected can be read. Continuous records of rainfall are provided by self-registering instruments.

Ramblers' Association, an organisation formed with 1,200 members in 1935 and which now numbers *c.* 100,000. It has played a decisive influence on the creation of new long-distance paths. It supports the "Right to Roam" across all uncultivated land and in 1996 launched the 'Free Your Paths' campaign. The Countryside and Rights of Way Act came into force on 19 September 2004, opening up 4,000 sq. miles of mountain, moor and heath.

Rambouillet, a royal French château (14th cent., rebuilt 18th cent.), near Paris, and the official summer residence of the President of the French Republic. Also the name of the literary salon of the Marquise de Rambouillet (1588–1665).

Rampant, in heraldry, is a term applied to the figure of an animal with forelegs elevated, the dexter uppermost. When the animal is shown side-faced it is *rampant displayed*, when full-face, *rampant guardant*; when looking back *rampant reguardant*; and when in sitting position *rampant sejant*.

Rape, a cruciferous plant yielding coleseed or rapeseed, extensively grown in all parts of Europe, India *etc.* Rape oil is made from the seeds and as oilcake is a valuable animal feeding-stuff. Since 1970 UK production has soared.

Rare Gases (also called **Inert Gases**). These are a group of elements which are chemically inert, comprising helium, neon, argon, krypton, xenon and radon. Cavendish in 1785 noticed that there was in air some gas which was not oxygen, nitrogen or carbon dioxide, but it was not until 1894 that the first of the rare gases was found by Rayleigh and Ramsay. This they called argon (inert). After the discovery of helium in 1895 Kayser, Rayleigh and Travers soon isolated the other gases except radon, which was later detected as a radioactive decay product of radium. Some of these inert gases are used to fill electric-light bulbs, and helium is used in balloons, since it is very light and non-imflammable.

Rat, a well-known group of rodent embracing over 60 species. The *brown rat* appeared in Europe early in the 18th cent., coming from the East and entering by way of Russia; now it is widespread. The *black rat*, which was the common rat before the arrival of the brown species, is a smaller animal and now scarce. The largest is the Bosavi woolly rat, found in Papua New Guinea.

Rational Number, a number which can be expressed as a ratio of two whole numbers. Examples are $2, \frac{1}{2}, 0{\cdot}3, -8$. *See* **Irrational Number**.

Rattlesnake, venomous snakes which obtain their name from the possession of a rattle in the end of their tail, consisting of horny pieces so arranged that when vibrated they make a rattling sound. They are only found in N. and S. America.

Raven, a black-plumaged bird of the crow family, with raucous voice and massive bill. Occurs in many parts of Europe, Asia and America. Ravens were once a symbol of death and foreboding. Dickens had one, described in *Barnaby Rudge*.

Ray, fish with a very flat body and broad and fleshy pectoral fins, related to the sharks. There are *c.* 500 species. Also known as *skate*. Manta rays are remarkably beautiful and have the largest brains of all fish. This 'gentle giant' is also a predator of the deep.

Razorbill, a sea-bird of the auk family, having a high, furrowed bill and black-and-white plumage. It inhabits rocky cliffs during the breeding seson, and at other times is mostly out on the open sea.

Rectifier, an electrical device which will allow electric current to flow in one direction only and can therefore be used for turning alternating current into direct current. Since electricity is usually supplied in alternating form and frequently needed in direct form, rectifiers are of very common use in both industry and the home, for example in radio and television and for battery chargers. Rectifying properties are possessed by a number of different devices, one of which is a thermionic diode (*see* **Valve**).

Very large valves filled with mercury vapour are often used for rectifying heavy currents for industrial purposes. Many other rectifiers use semiconductors in close contact with metals or with other semiconductors because such junctions have the property of passing electric current easily only in one direction.

Recusants, people who refused to attend the Anglican Church or to accept the ecclesiastical supremacy of the Crown in the 16th and 17th cent.

Red Rum, the most famouse racehorse of modern times. Winner of three Grand Nationals (1973, 1974, 1977). His trainer was Ginger McCain (1930–2011).

Redbreast. *See* **Robin.**

Redstart, a small bird of the Thrush family of handsome plumage and striking song. Two species visit Great Britain: the Common Redstart, with bright chestnut rump and tail, white forehead and black cheeks, favours wooded country, and the Black Redstart, with black breast and throat, chestnut tail and white wing bars, prefers rocky ground or ruins, and breeds in S. England.

Redwing, a bird of the Thrush family which finds its way to this country for the winter. Resembles the song thrush, but distinguished by smaller size, buffish-white eye-stripe, chestnut flanks and underwings. It has bred in Scotland and on Fair Isle.

Redwood *or* **Sequoia.** This genus of coniferous tree comprises two species of Redwoods occuring in N.W. America. Specimens of one species, the Giant Redwood, reach a height of over 90 m and a thickness of 11 m. The age of the largest, the General Sherman tree, is put at over 3,500 years.

Reeve. *See* **Ruff.**

Referendum and Initiative, two methods by which the wishes of electors may be expressed with regard to proposed legislation. It is developed to the highest extent in Switzerland. In a *Referendum* some specific matter is referred to the electors. The *Initiative* is the means by which electors can compel their representatives to consider a specific issue. The British Labour Government held a referendum in June 1975, on whether to remain in or withdraw from the European Economic Community. The result was for continued membership.

More recently referenda have been held in Scotland and Wales over devolution of power to elected assemblies. In May 1998 Londoners voted in favour of an elected Assembly and Mayor. In 1999 Australia voted against becoming a republic in a referendum. In 2002 Switzerland voted to join the UN. In 2005 both France and the Netherlands rejected the proposed new EU constitution. In June 2008 Ireland rejected the EU Treaty of Lisbon in a referendum but in October 2009 a second referendum reversed this. A referendum in the UK on electoral reform was held in May 2011. The result was a decisive rejection of the AV system by 67·9% to 32·1%. A referendum on Independence for Scotland was held on 18 September 2014. The outcome was a 55% to 45% vote to stay in the UK.

A referendum on the EU was held in the United Kingdom on 23 June 2016. The outcome was a dramatic vote to leave the EU. *See* **D22.**

Refraction. The change of direction which light rays undergo when passing from one medium to another. The phenomenon is due to the fact that in different media light (and other forms of radiation) has different speeds.

Refractory, a substance capable of standing high temperatures and therefore useful for making furnaces and allied apparatus. Some insulating refractories are fire-clay, alumina, porcelain, carborundum, graphite and silica. Some refractory metals are platinum, molybdenum, tungsten and also the alloys nichrome, chromel and alumel.

Refuge, charity supporting women experiencing domestic violence. Its national crisis line (0990 995 443) is available 24 hours a day.

Reindeer, a genus of deer horned in both sexes, occurring only in northerly regions. It has an average height of 1·3 m, is very fleet of foot and the Laplanders utilise it for draught purposes and for food. All reindeer antlers are a unique shape. Climate change (and the Arctic thaw) is causing a fall in Canadian reindeer numbers. The Svalbard reindeer is the most northerly herbivore in the world.

Relativity. The laws of relativity have been substantially proved and have revolutionised our ideas as to the nature of space, time, matter and energy and forced us to think along new lines. In 1949 a new theory by Einstein was announced which sets forth in a series of equations the laws governing both gravitation and electromagnetism, which is said to bridge the gap that separates the universe of the stars and galaxies and the universe of the atom. At present the one is explained by relativity, the other rests on the quantum theory **Section T**.

Remembrance Sunday. *See* **Armistic Day, L9.**

Republican Party of the United States was born by the fusion in 1854 of the group who called themselves National Republicans, having split from the Democrats over tariffs in 1825, and the northern Democrats, both of them being opposed to slavery. It came to power when Abraham Lincoln was elected President in 1860 and won 14 of the 18 presidential elections held between 1860 and 1932. It was defeated in 1932 largely as a result of the economic depression and reached its lowest ebb in the years of Roosevelt's New Deal (*q.v.*) The Party went on being defeated every four years until Eisenhower's victory in 1952. Nixon narrowly failed to defeat Kennedy in 1960 and Goldwater was decisively beaten by Lyndon Johnson in 1964. In 1968 and again in 1972 Nixon was successful in winning the Presidency. His fall from power in the aftermath of Watergate made 1974 a bad year for the Republican Party. In 1980 and in 1984, Reagan won landslide victories. George Bush completed a trio of Republican victories in 1988.

George Bush was himself defeated by Bill Clinton in 1992. The party was again defeated in the 1996 presidential election but narrowly sec-ured the election of George W. Bush in 2000. In November 2004 Bush secured a more decisive victory for the Republicans, but the 2008 elections saw a heavy defeat. Under Mitt Romney the party was again defeated in the 2012 Presidential election. It made a recovery in the 2014 mid-term elections. The 2016 presidential election was won by the right-wing maverick Republican Donald Trump.

The symbol of the Party is an elephant, the invention of Thomas Nast, a cartoonist, in 1874.

Reredos, the ornamental screen at the back of the altar or communion table. It is often of a highly decorative character and is an architectural feature in many churches in Spain. Other examples are to be found in the following cathedrals in England: Southwark, St. Albans, Winchester, Durham and Liverpool.

Resins, natural resins are vegetable compounds largely employed in the industrial arts. They comprise india-rubber, amber, mastic, copal, *etc.* "Synthetic resins" is a term sometimes used as a synonym for "plastics".

Reuter, an international news agency, founded by Baron J. de Reuter in 1849.

Rhea, a large flightless bird, the "ostrich" of S. America, distinguished from the ostrich proper by smaller size, longer beak, larger wings, no tail and 3 toes instead of 2. There are 2 species. It can run at up to 40 mph.

Rhinoceros, a large almost hairless animal related to the horse. Two kinds in Africa and several others in Asia. They have a horn, sometimes two, over the snout composed of modified hair. Most are leaf eaters but the largest species, the white rhino of South Africa, is a grazer. They have been much hunted for their horns. Their numbers, which fell sharply in the last two decades, now total around 20,000. The Western Black Rhino of Africa was declared extinct in 2011. Almost all white rhinos are found in South Africa, Namibia, Kenya and Zimbabwe.

Rhubarb was known to the Chinese by 2,700 B.C. Cultivated originally for its medicinal properties. Imported into the UK since the 18th century.

Rhodium, a metallic element, no. 45, symbol Rh, discovered by Wollaston in 1804. It is found in platinum ores in small amounts, generally less than 2 per cent. With platinum it gives a hard and durable alloy. It is also used, instead of silver, in putting the reflecting layer on a mirror.

Ribbon Fish *or* **Oarfish**, a deep-sea fish, deriving its name from its ribbon-like shape. Though fairly long, it is only a few centimetres thick. The ribbon fish is rarely met with because of its habitat, and most of what is known about it was first learnt from specimens cast ashore.

Rice, a grain-yielding grass, of which thousands of strains are known today, extensively cultivated in China, India, S.E. Asia and certain parts of America, and forming the main food of the peoples of China, Japan, India and S.E. Asia. Some 95 per cent. of the world's rice is produced and consumed in the Orient. The grain with the husk is known as "paddy". Arrack, an alcoholic liquor, is made from fermented rice seeds. There are over 120,000 varieties of rice with a range of exotic names, *e.g.* Basmati, Jasmine, Texmati. It is hoped new GM strains of rice with a greater yield will help to feed the world.

Richter Scale, a series of numbers used to record the relative magnitude of earthquakes. Devised by F. Richter of the California Institute of Technology. An earthquake is given a number on the scale by measuring the amplitude of earth movements, *i.e.*, the size of the to and fro motion in an earthquake wave, with a special instrument called a seismometer. The reading is corrected by calculation to allow for the distance of the instrument from the earthquake and the corrected results by observers at different places agree quite well. The scale is logarithmic, *i.e.*, earthquakes differing by one unit on the Richter scale are a factor 10 different in amplitude. An earthquake allotted zero on the scale would give a reading of 10^{-6} m on a standard seismometer 100 km from the centre of the earthquake. Smaller disturbances would have negative values on the scale. The largest earthquakes had Richter values between +8 and +9, *i.e.*, they had 10^{+8} to 10^{+9} bigger amplitudes than earthquakes of magnitude zero.

There are no upper or lower limits to the scale.

Rickshaw. Name derived from Japanese for "human-powered vehicle". Rickshaws reached India in the 1880s but are now banned in Kolkata.

Rime, a crystalline deposit of ice formed on objects exposed to wet fog at the same time as frost.

Rinderpest *or* **Cattle Plague,** is a highly contagious disease affecting cattle, sheep and other ruminants. In Europe the disease has been eradicated, but it was formerly very widespread and caused great loss of life among cattle. The disease is caused by a filtrable virus, and is attended by fever and congestion of the mucous membranes.

Ring Dove *or* **Wood Pigeon,** a blue-grey bird, distinguished from other pigeons by larger size (41 cm), white wing-bar, glossy green-and-purple neck and white half-collar. It is very common in Britain.

RNA (**Ribonucleic Acid**). *See* **Nucleic Acids, L80.**

Roaring Forties, name applied to the prevailing westerly winds over the oceans in the temperate latitudes of the Southern Hemisphere. Because they are unimpeded by large land areas the winds are more regular and stronger than the westerlies in the Northern Hemisphere.

Robin (**or Redbreast**). A small bird with olive-brown upper parts and orange-red forehead, throat and breast; both sexes look alike. The young are speckled, lacking the red breast. Its wide European distribution includes the British Isles, where it is the national bird. It also occurs in N. Africa and W. Asia. The nest is placed in a great variety of situations including holes in banks, trees and walls; in sheds, amongst ivy and sometimes in old tins. Nesting-boxes are readily adopted, but care should be taken to ensure that the entrance-hole is small enough to exclude starlings. Robins are pugnacious and defend their territories with vigour (around 10% die defending their territory). Urban robins sing at night to avoid the daytime noise of human society!

Their very attractive appearance, trustful disposition, engaging ways and sweet song make them extremely popular. Robin numbers which were declining because of cold and rain, habitat loss and pollution revived in the late 1990s.

The name robin is also applied to a number of very different birds, one of which, the American Robin, occasionally wanders to Europe.

Robots. Derived from the Czech word *robota*, meaning forced labour or drudgery. The word was first used by the Czech writer Karel Capek in 1920. The development of humanoid robots is currently well advanced. Many fear robots may cause mass unemployment.

Rock Dove, the grey pigeon *Columbia livia* of Europe and Asia. It is the ancestor of the domestic pigeons as Darwin was the first to show.

Rockets were invented by the Chinese as long ago as the 11th cent. The Germans devised the huge V2 rocket, carrying a ton of explosive, which was used near the end of the war to bombard London. Rockets are propelled by the burning of fuel (*e.g.*, hydrogen), the exhaust, ejected at high velocity, thrusts the rocket forward.

The provision of enough launching velocity involves the use of rocket motors with adequate thrust. To launch a satellite into an orbit circulating within a few hundred kilometres of the surface a velocity of 29,000 km/h must be imparted. This may be done by using a multi-stage launching system. When the first-stage motor has burned out it drops off, so that, when the second-stage motor ignites, it does not have to support the weight of the first-stage, and so on. If the launching velocity is increased to 40,000 km/h the vehicle will not return to the neighbourhood of the earth but pass out of the range of the earth's gravitational pull completely.

Unless the launching velocity reaches 161,000 km/h it will not escape from the sun and will become an artificial planet.

Rock Magnetism. The study of naturally occurring magnetism in rocks is a subject which has gained considerable importance in recent years. There are two principal reasons for this. One is that this so-called "fossillised magnetism" may be able to tell us more about the past history of the earth's magnetic field. The other is that after many years of heated dispute between geologists rock magnetism promises to settle once and for all the controversy as to whether or not the continents have changed their relative positions in past times (continental drift theory (*q.v.*)). This branch of geophysical research, in addition to its academic interest, may well have important economic consequences.

Thus, it might, for instance, become possible to locate mineral deposits once accumulated under special conditions at certain latitudes but now drifted to other places. Salt and similar deposits formed by the continuous evaporation of solutions in hot countries are one example; oil may well be another. There has been a *steady* change in rock magnetisation direction with geological time. It is known with some accuracy that the most recent reversal took place 700,000 years ago. It has been found that the older the rock, the farther removed is its fossil magnetisation from the present field.

Roe, popular name given to organs in fish which produce eggs and sperms. "Hard roe" is that of the female and consists of eggs; that of the male is the soft roe or milt.

Roe Deer (*Capreolus capreolus*) deer native to Europe. Found in England and Scotland but not Ireland. "Roebuck" is the name of the male adult.

Roller, a tropical Old World bird of the *Coraciidae* family, related to the hoopoe, kingfisher and bee-eater, of strikingly brilliant blue, chestnut, greenish-blue plumage. There are fifteen species, one of which breeds in the far north and visits the British Isles on its migrations to and from its winter quarters in Africa.

Roman Numerals. See **G9**.

Roman Roads, long-lasting highways constructed by the Romans. The best known British roads were *Ermine Street* (London, Lincoln, York), *Fosse Way* (Lincoln through Leicester, Cirencester, Bath, Exeter) and *Watling Street* (Channel Ports, London to Shropshire). New lidar techniques are revealing more lost Roman roads.

Roman Towns. *See* **G12**.

Roman Walls were built as frontier barriers under the Emperors Hadrian (76–138) and Antoninus Pius (86–161). Hadrian's works, linking Wallsend-on-Tyne with Bowness-on-Solway, comprised a twenty-foot stone wall, ditches, turrets, "milecastles", fortresses and a double earthen mound, or "Vallum". Impressive ruins are still visible at Chesters and Housesteads.

Antoninus Pius, Hadrian's successor, made a further advance, but the turf wall which he built between Forth and Clyde was soon abandoned. Septimius Severus (146–211) restored Hadrian's wall after the assassination of Commodus and the subsequent civil wars. It was finally abandoned between 380 and 390. It is now a UNESCO World Heritage Site.

Romany. *See* **Gypsies.**

Rood Screen, an ornamental partition, separating the choir from the nave in a church, and supporting a crucifix or rood.

Rook, a member of the crow family, abounding in most parts of the British Isles and found in Europe, Asia and N. Africa. It has been introduced into New Zealand. Rooks usually nest in colonies in tall trees. They are highly intelligent birds, adept at making and using tools.

Rosary, a circular chain of beads, used by Catholics when reciting a particular form of prayer. Each bead represents an entire prayer, and the combined prayers constitute the Rosary.

Rosetta Space Mission. *See under* **Comets.**

Rosetta Stone, discovered in 1799 by the French at Rosetta in Egypt, and deposited in the British Museum. It is a piece of black basalt about 91 cm long, and contains a decree of the Egyptian priests of Ptolemy V Epiphanes (205–181 B.C.) in (1) hieroglyphics, (2) demotic and (3) Greek characters.

It was the three different inscriptions on the same stone that enabled hieroglyphic writing to be deciphered.

Rotary Engine. *See* **Wankel Engine.**

Rotten Row, a corruption of *route de roi* (king's drive), the riding resort in Hyde Park.

Roulette, a gambling game played on a table carrying a revolving wheel divided into 37 compartments. Each compartment bears a number, 0 (zero) and 1 to 36. The numbers are mixed and do not follow any particular order. Of these 37 numbers 18 are black and 18 are red, whereas zero is green. The players stake their money on any compartment, colour or combination of numbers. The wheel is whirled round and a ball is set rolling in the opposite direction, dropping finally into one of the compartments, deciding the winning number and colour.

Royal Academy of Arts was founded in London in 1768, under the patronage of George III. The early exhibitions of the Academy were held first in Pall Mall, and later in Somerset House where the exhibitions continued to be held until 1836, when the National Gallery being built, the Academy moved its quarters to that building. In 1869 the present Royal Academy at Burlington House was opened. List of presidents: Sir Joshua Reynolds (1768), Benjamin West (1792), James Wyatt (1805), B. West (1806), Sir Thomas Lawrence (1820), Sir M. A. Shee (1830), Sir C. Eastlake (1850), Sir F. Grant (1866), Lord Leighton, (1878), Sir J. E. Millais (1896), Sir E. J. Poynter (1896), Sir Aston Webb (1919), Sir F. Dicksee (1924), Sir William Llewellyn (1928), Sir E. Lutyens (1938), Sir A. J. Munnings (1944), Sir Gerald F. Kelly (1949), Sir A. E. Richardson (1954), Sir Charles Wheeler (1956), Sir Thomas Monnington (1966), Sir Hugh Casson (1976), Sir Roger de Grey (1984), Sir Philip Dowson (1993), Professor Sir Phillip King (1999), Sir Nicholas Grimshaw, 2004–11 and the engraver Christopher La Brun, 2011 -.

Royal Botanic Gardens. *See* **Kew Gardens.**

Royal British Legion, the ex-servicemen's welfare organization founded by Earl Haig in 1921. A non-political organization, it organizes the sale of poppies on Remembrance Day. It has around 350,000 active members.

Royal Hospital, Chelsea, built by Wren, opened in 1694 as an institution for invalid soldiers.

Royal Institution, established 1799, and incorporated by Royal Charter in 1800 for "the promotion, extension and diffusion of Science and of Useful Knowledge". It was in the building of the Institution that Faraday conducted his experiments. It is now also famous for its Christmas lectures begun by Faraday in 1825.

Royal Mail. *See* **Post Office.**

Royal Society was founded in 1660 and incorporated by Royal Charter in 1662. A leading early figure was Sir Robert Moray. Viscount Brouncker was named the first president. Its *Philosophical Transactions* date from 1665.

Among those who served as president of the Royal Society are Sir Christopher Wren, Pepys, Sir Isaac Newton, Sir Joseph Banks, Sir Humphry Davy, Prof. T. H. Huxley, Lord Rayleigh, Sir Archibald Geikie, Sir J. J. Thomson, Lord Rutherford, Sir William Henry Bragg, Sir Henry Dale, Lord Adrian, Lord Florey, Lord Blackett, Sir Alan Hodgkin, Lord Todd, Sir Andrew Huxley, Lord Porter, Lord May and Lord Rees. The current (since December 2015) President is Professor Sir Venki Ramakrishnan.

Royal Society for the Protection of Birds (RSPB), one of the foremost conservation societies. With over 1 million members it is the largest wildlife organisation in Western Europe. It formed its 200th nature reserve in 2007 (in Sutton Fen).

Rubber, substance obtained from the milky juice (latex) exuded by certain tropical trees and shrubs after tapping. Demand spread so rapidly in the 19th cent. that plantations were established wherever the tree would grow. Seeds of the Para rubber tree (*Hevea brasiliensis*) native to the Amazon basin were obtained by Kew, the young plants shipped to Ceylon and it was from these cultivated trees that the vast plantations of Malaysia and Indonesia developed (by the 1930s Asia dominated the rubber market). Recent years have seen great advances in the production of synthetic rubber.

Prehispanic peoples (*e.g.* the Olmec) used rubber 3,500 years ago.

Rubicon, a small river falling into the Adriatic, and forming one of the Italian boundaries, the crossing of which anciently involved decisive action and constituted a declaration of war. Thus the phrase "crossing the Rubicon", denoting an act from which there is no withdrawal.

Rubidium, a metallic element, no. 37, symbol Rb, most closely resembling potassium. It is silver-white and very soft, and was discovered in 1861 by Bunsen and Kirchhoff, using the spectroscope. It is rare, occurring in small amounts in the mica called lepidolite and in potash salts of the Stassfurt deposits in Germany.

Rubik's Cube was invented in 1974 by the Hungarian, Ernö Rubik, a professor of architecture and design.

Rubrics are instructions in regard to the ceremonies of the Church, appearing in red in the Prayer Book.

Ruby is a deep red variety of Corundum (aluminium oxide); one of the most valued of precious stones. Burma yields some of the finest, and rubies of inferior colour are found in Thailand, Sri Lanka, South Africa and Brazil.

Rudd, a fresh-water fish of wide distribution, plentiful in the rivers of Britain. It is of a reddish-gold colour, with a greenish-blue beard.

Ruff, a bird related to the common sandpiper, once common in the Fen districts. The males have a ruff of feathers round the neck in the breeding season. The female is the Reeve.

Ruffe *or* **Pope,** a small fresh-water fish common in most parts of central Europe, and similar to the ordinary perch. It is found in British rivers.

"Rule, Britannia!" the national sea-song of England, was written by James Thomson (1700–48), the author of the "Seasons", and set to music by Dr. Arne about 1740. The poet's words were "Britannia, rule the waves!" but it is usually rendered "Britannia rules the waves."

Rum, a ardent spirit distilled from molasses, and containing from 40 to 50 per cent. of alcohol. It is chiefly manufactured in the Caribbean, and derives its special flavour from a volatile oil.

Ruminants, animals that chew the cud, having a compartmented stomach, enabling them to swallow food, and later to bring it back to the mouth for mastication; *e.g.*, sheep, goats.

While in the rumen some digestion of food, especially cellulose, takes place by bacterial action.

Runcible Spoon, a kind of fork used for pickles having three broad prongs. The word was used by Edward Lear about 1870 as a nonsense word and may be derived from *Rounceval* meaning large or huge from the bones said to have been dug up at *Roncesvalles* where Roland fell. Rounceval peas are the large peas called "marrowfats".

Runes, certain characters of an alphabet found in inscriptions in the Germanic languages, found cut into buildings and implements of stone or wood in many parts of northern Europe, including Britain. The runic alphabet originally had 24 letters. Scholars agree that some runes derive from Greek, others from Latin.

Ruskin College, the first residential college for working people, founded at Oxford in 1899 by the American Walter Vrooman.

Russification. To make Russian in culture, language, customs, *etc*. Both under the Tsar and communist rule, attempts were made at Russifying the national minorities of the empire and the USSR to prevent regionalism and a break-up of the state.

Rusts, parasitic fungi, some common species of which have reddish spores which in a mass have a rusty appearance. A well-known species is the Wheat Rust (*Puccinia graminis*), which has an alternative host in the barberry.

Ruthenium, a greyish-white metallic element, no. 44, symbol Ru, discovered by Claus in 1845. It is harder and more brittle than platinum, in whose ores it occurs.

Rutile, mineral titanium dioxide. It is found in many igneous rocks, and in gneisses and schists, Its commonest colour is reddish-brown.

S

Sabbath and Sunday. Sunday, or the Lord's Day, is the first day of the week in the Christian year. It was substituted for the Jewish Sabbath in the 1st century. A.D. as the Christian day of worship in commemoration of the Resurrection. *See also* **Sabbatarianism, Section J**.

Sabbatical Year was instituted by the Jews in ancient times for the purpose of giving the soil a rest from cultivation. This was every seventh year. In universities a sabbatical year is a year of absence for study and travel.

Sable, a furred mammal of the weasel family mainly inhabiting Siberia. It is bright brown in colour, and has a long, bushy tail. American sable is a marten.

Saccharin, a white crystalline solid manufactured from toluene, 550 times as sweet as cane sugar. It is used as a sweetening agent; as a substitute for sugar when sugar is forbidden, as in certain diseases, or when there is a shortage.

Safety Lamp, as used in coal-mines, was invented by Sir Humphry Davy in 1816. The flame is enclosed in a cage of fine-meshed wire which allows air to enter and promote burning, but conducts away the heat generated in combustion so that no product of combustion escapes at a temperature high enough to ignite explosive gases in the mine.

Saffron, a plant similar to a purple crocus. It is used for orange flavouring and colouring. Nearly all saffron comes from Iran. In Spain saffron gives paella its distinctive flavour and much saffron is grown in La Mancha. It is the world's most expensive spice. It was once an important crop in East Anglia.

Sainfoin, a widely cultivated forage plant, especially adapted for sheep. It is of strong, leafy growth and bears bright red flowers. It belongs to the same family of plants as peas and beans.

St. Elmo's Fire, a glowing brush-like discharge of electricity which takes place from sharp-pointed objects on mountains or the masts of ships exposed to the intense electric fields of thunder-clouds.

St. John's Wort, a shrublike wild plant with bright yellow flowers. It yields hypericum and is used as an effective remedy for depression, but prolonged use can cause diarrhoea.

St. Martin's Summer. In traditional folklore, a time of relatively warm weather in Novemeber.

St. Paul's Cathedral is the third cathedral church to be built on the site. It was preceded by a Norman building which was practically destroyed by the Great Fire in 1666. This followed a Saxon church which was burnt in 1086. The present building was designed by Sir Christopher Wren. The foundation stone was laid in 1675 and the structure was completed in 1710. It cost a little under £748,000. Its central feature is the dome, crowned by its cupola and lantern with the golden ball and cross. It escaped serious damage during the blitz.

Saints' Days. In the liturgy of the Roman Catholic church a saint is commemorated and his intercession sought on a special day (saint's day), usually the anniversary of his death. Pope Paul decreed that from 1 January 1970 many saints were to be dropped from the calendar and others demoted. There are now only 153 saints' days plus those in honour of the Apostles, Saint Joseph and the Virgin Mary. The festival of All Saints is on 1 November.

Saladin Tithe. A tax levied in 1188 in England and France to raise money to wage a crusade against Saladin, the Muslim leader. The tithe, which was levied at a tenth of income and the value of capital, represented the first attempt to tax personal property and was levied on both laity and clergy.

Salamanders are amphibia superficially resembling lizards, from which they differ in having a moist skin and no scales. The axolotl is a salamander famous for its ability to regenerate. The ancestors of giant salamanders once walked on land. They are the world's largest amphibian, but critically endangered.

Salmon, a fish notable for its habit of returning from the sea to spawn in the river where it was itself hatched (guided, it is now known), by the use of magnetic fields). Their origin can be inferred from the chemical composition of certain blood proteins. Salmon from the two sides of the Atlantic migrate to communal feeding grounds off Greenland. The decline of wild salmon in Scottish rivers is now alarming conservationists. Scotland currently has the world's third largest salmon farming industry. Salmon is Scotland's largest food export. Young salmon are known as smolt. The greatest runs of wild salmon are in Alaska.

Saltire. The national flag of Scotland.

Saltpetre. *See* **Nitre.**

Salvarsan, the organic arsenical compound asphenamine, which Ehrlich discovered was able to kill inside the human body the spirochaete germ that causes syphilis. Also known as "606". It was superseded first by neosalvarsan and now by penicillin.

Salvation Army. *See* **Section J.**

Samarium, metallic element, no. 62, symbol Sm, one of the lanthanides (*q.v.*). Discovered in 1879 by Boisbaudran.

Sami (Laplanders). The bedouin of the far north, the last nomadic tribes of Europe. Their way of life is intimately bound up with the reindeer. The reindeer herds feed, clothe and shelter the Sami of Finland, Norway and Sweden.

San Andreas Fault, is the dividing line between the North American plate and the North Pacific Ocean plate where "plate" means one of the rigid sections of the earth's crust as conceived in the theory of plate tectonics (*q.v.*).

The fault runs roughly north-west–south-east in California passing near San Francisco. The Pacific Ocean bed and the North American continent are sliding past each other along this fault at about 5 cm per year. As at all plate-to-plate boundaries—another is the Western Pacific coast—the San Andreas fault is the scene of great earthquake activity. Between 1934 and 1970 there were over 7,000 earthquakes severer than magnitude 4 on the Richter scale (*q.v.*) in and near southern California.

Because of large population centres, the activity of San Andreas region is studied with great care and some apprehension about a repeat of the San Francisco earthquake of 1906 which caused displacements of up to 6·4 m along the San Andreas Fault.

Sand Eel. *See* **Launce.**

Sanderling, small wading bird of sandpiper family; breeds in tundra regions of far north, and is seen on sandy beaches of Britain as a winter visitor, Conspicuous white wing stripe and, like Curlew, Sandpiper, Knot, Dunlin and other members of sandpiper family, has marked change of plumage between winter and summer.

Sandpiper, small- to medium-sized wading birds of several species whose migratory powers are so great that they are found in most parts of the world. They include the Common Sandpiper, a bird about 18 cm long, greenish-brown head and back, white under-parts, beak long and slender; Purple, Wood and Curlew-Sandpipers.

Sanskrit, the language of ancient India, spoken by the Brahmins, and existing in early Oriental literature. It was the language of literature and government until *c*. A.D. 1100. It is now confined to temples and places of learning. It is an Indo-European language, related to Latin and Greek.

Saponin. The term is a generic one applied to a range of organic compounds which produce frothy, soapy solutions. Saponins are extracted from the soapwort root, horse chestnut seeds, *etc*. Saponin is the basis of the "foam" used for fire fighting; it can be used like soap to make insecticides and fungicides adhere to the leaves of plants. Also used as detergents.

Sapphic Verse, a form of verse said to have been invented by Sappho, the lyric poetess of Lesbos.

Sapphire, a valuable deep blue variety of Corundum (aluminium oxide) found mostly in India, Sri Lanka and Northern Italy. Synthetic sapphire is often used for gramophone styli.

Saracen, the name given in classic times to the Arab tribes of Syria and adjacent territories. In the Middle Ages the common designation among Christians for their Muslim enemies.

Sarcophagus, the name given to a stone coffin, such as was used by the ancient Egyptians, Greeks, and Romans, for receiving the remains of their famous dead. These sarcophagi were often decorated with carvings and sculptures.

Sardines. *See* **Pilchards**.

Sardonyx. *See* **Onyx**.

Sargassum. Floating brown seaweed, kept buoyant by air sacs. Found in the Caribbean.

Satellite Communication, the system for transmitting telephone and television signals over long distances. The global satellite system Intelsat (International Telecommunications Satellite Organisation) was founded in 1964 to establish a worldwide system on a commercial basis. The first generation of Intelsat satellites to be launched was *Early Bird* in June 1965.

Today, satellites have a vast range of functions. Some astronomical earth satellites study the radiations from space that cannot penetrate the atmosphere: X-ray, gamma-ray, ultraviolet and infra-red astronomy have been revolutionised by satellites. Satellites are crucial for communications, weather forecasting, *etc*.

Satrap, the name given to the governor of a province (satrapy) in the ancient Persian monarchy.

Saturday, the seventh day of the week (the Jewish Sabbath), derived name from planet Saturn.

Saturn, the sixth planet in order from the sun, from which it is distant 1427 × 10^6 km and around which it makes a revolution in 29.46 years. It is 120,200 km in diameter or 9.42 times as large as the Earth and rotates on its axis in 10h 14 min. Saturn is so light it could float on water.

Saturn is noted for its magnificent ring system which is composed of myriads of ice-covered particles. These rings are denser and lumpier than once thought. Among the planet's 62 moons are Mimas, Enceladus, Tethys, Dione, Titan, Rhea, Hyperion, Iapetus and Phoebe. Saturn itself is named after the Roman god of agriculture.

Titan is the largest (radius 2,575 km), being the second largest satellite in the solar system, about the size of the planet Mercury. Galileo was the first to observe that Saturn was ringed; Christiaan Huygens the first to study the nature of the rings; and Jacques Cassini the first to suggest that they were composed of myriads of particles.

Our knowledge of the planet and its moons and rings was greatly increased by the spacecrafts Pioneer 11 (flyby Sept 1979), Voyager 1 (flyby autumn 1980) and Voyager 2 (flyby Aug 1981).

The Cassini-Huygens space probe, launched in 1997, captured spectacular images of Saturn and its 30 rings in 2004. It has sent back images of Saturn's moon Enceladus which acts like a pressure cooker, shooting jets of ice and water vapour from its south pole. It has also explained why Iapetus gets lighter and darker. Saturn is home to the solar system's longest continuously observed thunderstorm (breaking its own 225-day record in 2009). In 2009 a colossal new outer ring (located 3·7 million miles from the planet) was discovered.

The Great White Spot on the surface of Saturn is caused by lightning 10,000 times stronger than that experienced on Earth. *See* **Voyager 1 and 2.**

Sawfly. These insects are considered to be the most primitive members of the order (*Hymenopetra*) to which the bees and wasps belong. In appearance they resemble somewhat the latter, but there is no waist separating thorax and abdomen. The ovipositor is never used as a sting; usually it is saw-like so that the female can use it to make incisions into tissues of plants where the eggs are laid. The larvae look like caterpillars of butterflies and moths.

Saxons, a Teutonic race originally inhabiting what is now Holstein. By the 7th cent. they had, with the Angles and Jutes, conquered and colonised most of England. The three main Anglo-Saxon kingdoms were Northumbria, Mercia and Wessex. The Saxons first arrived *c*. 449 A.D.

Scallop, marine bivalve molluscs of the genus *Pecten*, which is widely distributed. The scalloped edge to the shell results from a pattern of radiating groves. Related to the oyster.

Scandium, a metallic element, no. 21, symbol Sc. It was discovered in 1879 by Nilson, and occurs in small quantities in certain rarer minerals.

Scarabaeidae, a family of beetles (Scarabs) widely distributed through Africa, Asia and Europe. It is to this genus that the "Sacred Beetle" of the Egyptians belongs, and numerous representations of it are found on ancient monuments.

Sceptre, the staff or rod used since ancient times to symbolise supreme authority. The sceptre used for the coronation of Queen Elizabeth II is the one made for Charles II. It is about 90 cm long and tipped with a jewelled cross.

Schism, an ecclesiastical term for division in a church. The East–West Schism was the separation of the Greek Church from the Latin, finally established in 1054. The Great Schism was the division in the Roman Catholic Church from 1378 to 1415, when there were two lines of popes, one at Rome and one at Avignon.

Schist, the geological name of certain metamorphic rocks composed for the most part of mineral with thin plate-like crystals (*e.g.*, mica) so that the layers of a schist are closely parallel. Quartz occurs in schists, and where it preponderates the term "quartz schist" is applied.

Scientific Units. The International Bureau of Weights and Measures at Sèvres near Paris, is the custodian of accurate scientific measurement in terms of internationally agreed units.

Methods of measurement are continually being improved and measurements of new kinds coming into use. In defining units certain principles are essential:

(i) units should be so defined that measurements made in one laboratory should be reproducible in another with as much consistency as possible;

(ii) units of all kinds should, so far as practical, form an interrelated system based on as few fundamental units as possible;

(iii) the fundamental units adopted should have a natural basis, independent of particular man-made objects.

An invariable universal natural standard was achieved for the metre in 1958 when it was defined in terms of the wavelength of a line in the spectrum of krypton-86. This was changed in 1983. *See* **Metre** and **SI Units.**

Scone, Stone of, the ancient symbol of Scottish sovereignty. Known as the 'Stone of Destiny' it was placed in Edinburgh Castle in November 1996 (having been removed from Scotland in 1296 by Edward I, the 'Hammer of the Scots'). On Christmas Day 1950 the stone was stolen by four Scottish students.

Scorpion. The scorpions constitute an order of the arthropods. Distinctive features are the pair of powerful claws at the head and a "sting" at the tail, which curves over the back in attack or defence so that it points forwards. The poison injected by the sting is potent, causing instant death in spiders, centipedes, *etc*., and acute discomfort to humans. A cornered scorpion cannot sting itself to death; scorpions are immune to their own poison.

Scorpion Fly. The scorpion fly, of which there are less than 500 species, constitute a separate order of insects, the *Mecoptera*. They have 2 pairs of membranous wings, and gain their popular name because in some species the end of the abdomen is turned up, though it does not function as a sting.

Scrabble. Game invented in 1931 by the American architect Alfred Butts.

Scree *or* **Talus**, the mass of loose, angular rock fragments which accumulate towards the bottom of hill-sides and mountain-sides. These fragments have been detached by weathering processes, in particular frost action.

Scythians, nomadic conquerors and skilled horsemen (9th—3rd cent. B.C.) who inhabited much of Southern Europe and Asiatic Russia.

Sea Anemones *or* **Actinaria**, an order of marine animals of the coelenterate class *Antozia*. They form a large and varied group of over 1,100 species and they occur in many beautiful colours, flower-like in form.

Seaborgium, 106th element in the periodic table, named in 1994 after Glenn T. Seaborg (1912–99).

Sea Butterfly, marine molluscs which propel themselves by two "wings", or side expansions of the foot. They constitute the order *Pteropoda*.

Sea Cow. *See* **Manatee** and **Dugong.**

Sea Cucumbers *or* **Holothurians.** These animals constitute the class of echinoderms called *Holothuroidea*. They are elongated and wormlike, with a ring of about twenty tentacles round the mouth. There are *c.* 500 species. Criminals are poaching them for the lucrative Chinese market.

Sea Eagle, a genus of flesh-eating birds related to the true eagles, kites and other birds of prey. Examples are the Bald Eagle, emblem of the USA, White-tailed Eagle (Grey Sea Eagle), and Steller's Sea Eagle of the Pacific coast of Asia. Last known in Britain in 1911, but successfully reintroduced from Norway to the coast of Scotland in 1975 and now breeding well.

Sea Elephant *or* **Elephant Seal,** a curious genus of seal, the males of which possess a proboscis of *c.* 30 cm in length that suggests an elephant's trunk. They are found on the coast of California and in parts of the Southern Ocean. Antarctic elephant seals can dive to 6,000 ft. and stay submerged for up to two hours.

Sea Gravimeter, an instrument to determine the density of the earth's crust beneath the oceans. Designed by Dr. A. Graf of Munich and Dr. J. Lamar Worzel of Columbia University, it can detect changes of one-millionth of the value of gravity at the earth's surface.

Sea Hare, a genus of molluscs (*Aplysia*), so-called because of resemblance to a crouching hare. The shell is thin curved plate largely sunk in the animal's body. They have four tentacles, occur in Britain in the laminaria or ribbon wrack zone, and discharge a purple fluid when molested.

Sea Horse, sea-fish (*Hippocampus*), very numerous in the tropics and comprising some twenty species. Their bodies are ringed and they have prehensile tails. Their heads are horse-shaped, and they swim in a vertical position. The seahorse is unique in that males become pregnant. The females transfer eggs to a pouch in the male where he fertilises them. Seahorses do not mate for life and most are bisexual. The spiny seahorse and short-snouted seahorse live in British coastal waters. The seahorse is now a protected creature. They click to attract a mate.

Seal, a marine mammal of the *Phocidae* family. They are found in the cold seas of the world, including the waters around Britain. There is a ban on the sale of seal products in Europe.

Sea Lily. A class of echinoderms, the sea lilies may be roughly described as "stalked starfishes". There are about 400 living species and several thousand extinct species are known. Otherwise called Crinoids.

Sea Lizard. *See* **Glaucus.**

Sea Mouse, a genus of marine worms called *Aphrodite*, oval in shape, 20–23 cm long, iridescent, covered with fine bristles.

Seasons comprise the four natural divisions of the year, and are due to the inclinations of the earth's axis to the plane of the ecliptic (*q.v.*).

Sea Squirts *or* **Tunicates.** These animals are placed in the sub-phylum called *Urochorda*; found growing in rounded, jelly-like masses on rocks near low-water level. They get their name through the water jets they discharge.

Sea Urchin. Around 700 species forming the class *Echinoidae*. The body is globular and covered with spines which may be used for both defence and locomotion. The main organs of locomotion are the tube feet, as in starfishes.

Secondary Sexual Characters, characters of animals which are distinctive of sex, but have no direct connection with the reproductive process. Examples are: the mane of the lion and the antlers of some deer.

Secretary Bird, so called because of the quill-like plumes about its ears, is a bird of prey related to the eagles and vultures; common in Africa, and of considerable service as an exterminator of snakes. It is a large bird about 1·2 m in height.

Sedimentary Rocks. *See* **T63.**

Sedna. *See* **Pluto.**

Seismology, the branch of geophysics devoted to the study of earthquakes and other earth movements. The instruments registering earth tremors are termed seismographs.

In order to record the displacements completely, at one station, three seismographs are necessary to show the two horizontal and the vertical components of the motion. *See* **Richter Scale** and **Earthquakes**.

Selenium, a non-metallic element, no. 34, symbol Se; related to sulphur it is a dark red colour, and solid, found associated with sulphur, iron, pyrites, *etc.*, though only in small quantities.

It is a semiconductor (*q.v.*) and its special electrical properties have led to its use in photoelectric cells and rectifiers. Selenium is widely used in the chemical industry as a catalyst (*q.v.*) in producing aromatic hydrocarbons from less useful hydrocarbons. Also used in making some types of glass.

Recently, selenium has been seen to be helpful in reducing the risk of prostate cancer.

Selfish Genes. Genes are understood to be relatively small sequences of DNA, which are likely to last for many generations. Selfish Gene Theory proposes that the primary function of genes is self replication. The purpose of the organism in which the genes are carried is to ensure that the genes survive and reproduce whether they are advantageous to the organism or not. *See* Richard Dawkins, *The Selfish Gene* (1976).

Semiconductors, substances with numerous special and useful electrical properties. These include:

(**i**) they conduct electricity much better than do insulators, but much less well than metals (hence their name);

(**ii**) their power to conduct depends strongly on their temperatures—making them useful for temperature sensitive devices;

(**iii**) they are sensitive to light—hence their use in photoelectric cells and solar batteries;

(**iv**) when in contact with metals, or with other suitable semiconductors, they form a boundary layer which conducts electricity much better one way than the other—this is the basis of many rectifiers some of which, called crystal diodes, are an important component in electronic devices;

(**v**) their electrical properties can be greatly influenced by putting in minute amounts of impurity, this enables semiconductor devices, especially transistors, to be made with carefully selected properties.

Semiconductors were known to Faraday, but the semiconductor age really arrived with the invention of the transistor (*q.v.*) in 1947. The ubiquitous transistor is only one of very many semiconductor devices which perform a variety of functions in technical apparatus of all kinds.

Semiconductors used in technology are usually small crystals, frequently of germanium or silicon, and their robustness and small power consumption often make them superior to other devices, such as thermionic valves, which they often replace. Other semiconducting materials are cadmium sulphide, selenium lead telluride, indium antimonide.

Senate, the higher governing Assembly of a Legislature. The word, applied primarily to the Roman council, is also used to denote the upper chamber in France, the United States, *etc.*

Sensitive Plant. A species of Mimosa (*Mimosa pudica*), whose leaves are extremely sensitive to touch, shaking and burning.

Sepia, the "ink" of the cuttlefish. *See* **Ink Sac.**

September, the ninth month of the year, and the seventh of the old Roman calendar; hence the name, from Septimus. The designation was several times changed by the Emperors, but none of the new names survived for long.

Septuagesima Sunday, the 3rd Sunday before Lent.

Sequoia. *See under* **Redwood.**

Serpentine, a mineral: chemically a hydrous silicate of magnesium. Green serpentine is used as an ornament stone. Fibrous serpentine is called asbestos.

Serval, a collie-dog-sized cat, long-limbed and spotted, from Africa. Preys on a variety of animals, from lizards to small antelope. Black servals occur mainly in mountainous regions.

Set, both in everyday speech (as in tea set, chess set) and in mathematics, a set is a collection of things. The members of the set can be specified by listing them or by describing the properties necessary for membership of the set, *e.g.*, the set of ginger-haired boxers. Set theory is a very important branch of mathematics founded by a great mathematician, Georg Cantor (1845–1918).

Its development has influenced many other branches of mathematics.

Seven Deadly Sins. *See* **Sins.**

Seven Wonders of the World were: 1. The Pyramids of Egypt; 2. the Tomb of Mausolus, King of Caria (hence the word mausoleum); 3. the Temple of Diana at Ephesus; 4. the Walls and Hanging Gardens of Babylon; 5. the Colossus at Rhodes; 6. the Ivory and Gold Statue of Jupiter Olympus; and 7. the Pharos, or lighthouse, built at Alexandria by Ptolemy Philadelphus, King of Egypt (the foundations of this were discovered in 2005 by French archaeologists). There are now plans to reconstruct this. One modern theory suggests the Hanging Gardens of Babylon were built near Nineveh by the Assyrian monarch Sennacherib. Some people class the Terracotta Army (*q.v.*), found in China, as an eighth wonder of the world.

Sexagesima Sunday, the 2nd Sunday before Lent.

Sextant, a reflecting instrument for measuring the angular distances of objects. It is of special importance in navigation and surveying, and contains 60 degrees described on a graduated arc. A small telescope is attached and there are also a couple of mirrors which reflect the distant objects so as to enable them to be accurately observed.

The invention is attributed to John Hadley, and to Thomas Godfrey independently, about 1780. The principle had been foreseen, and its application described, at earlier dates by Newton, Halley and Hooke.

Shad, a marine fish belonging to the same genus as the herring. It is found along the Atlantic Coast of the USA, and ascends rivers to spawn.

Shagreen, shark's skin: also untanned leather of peculiar grain made from skins of wild asses, camels and horses.

Shalloon, a kind of cloth manufactured from wool and worsted, and used chiefly for women's dresses and coat linings. It was first made at Châlons-sur-Marne. It was called "chalouns" by Chaucer and "shalloons" by Swift.

Shamrock, the three-leaved clover-like plant native to Ireland and its national emblem.

Shard. *See under* **Skyscrapers.**

Shark, a large and powerful ocean fish, comprising *c.* 510 species, very widely distributed, but most numerous in tropical seas. They have formidable teeth and are the most carnivorous of all fishes. They usually attain a large size, the whale-shark being often of a length of 15 m. Commercially the shark yields shagreen from its skin, the fins are made into gelatine, and an oil is obtained from the liver. Many shark species are now threatened with extinction as a result of over-fishing by man (*e.g.* in the Indian Ocean and the NW Atlantic). Female hammerhead sharks can reproduce without having sex. Sharks can only swim forwards. The whale shark is the biggest fish in the sea. It is now known that sharks are colour blind. Despite human fear of shark attacks, more people die from coconuts falling on their heads than from shark attacks!. Asian demand for shark fins causes a cruel slaughter each year, estimated at 90 million sharks. Around half the shark species live in the deep seas.

The Greenland shark can live for over 270 years, making it the longest-living vertebrate.

Sheep, a well-known family of ruminants of great utility as wool-producers, and for food. From the earliest times sheep have been a source of wealth to England. So much were they valued in the 15th and 16th cent., that their exportation was frequently prohibited.

Sheep are classified as (1) longwools; (2) shortwools; and (3) mountain breeds. Most of the longwools carry Leicester blood in their ancestry and the shortwooled Down breeds carry the blood of the Southdown. The Southdown produced the present Suffolk, one of the most popular breeds. Cheviot is an important mountain breed. Of the foreign breeds the most valued are the Merino sheep (*q.v*) of Spain, which yield a fine long wool. The first successful cloning of an adult sheep (Dolly) was achieved in 1997. *See also* **Wool.**

Shelduck, a handsome genus of surface-feeding ducks, one of which, the common shelduck, is an inhabitant of Great Britain. It is a beautiful white-and-chestnut plumaged bird with dark-green head and neck and red bill. The ruddy shelduck appears in Britain occasionally.

Shell Shock. Term used in the First World War for the mental disorientation suffered by troops resulting from the constant noise of artillery barrages in the trenches. Troops suffered terrible flashbacks and nightmares.

Shellac. This resin is the secretion of the lac insect (*Coccus lacca*), which occurs in the forests of Assam and Thailand. It is used for making varnish *See also* **Lac.**

Shelter, the charity for the homeless, founded 1966.

Sherardizing. Process for coating steel or iron parts with zinc to prevent corrosion.

Shilling has been an English coin from Saxon times, but it was not of the value of 12 pence until after the Conquest. It was interchangeable with the 5 new pence decimal piece which came into circulation in 1968. A new, smaller 5p coin was introduced after 1991.

Ships have existed from prehistoric times. There is mention of one that sailed from Egypt to Greece in 1485 B.C., and in 786 B.C. the Tyrians built a double-decked vessel. No double-decked ship was known in England, however, before the *Royal Harry* was built by Henry VII, and it was not until the 17th cent. that shipbuilding was carried on in Great Britain as a prominent industry. For some famous ships in history, *see* **G23–4.**

Shoddy, the name given to a kind of cloth mainly composed of woollen or worsted rags, torn up and re-fabricated by powerful machinery. It was first made at Batley in Yorkshire *c.* 1813.

Shooting Star, the popular name for a meteor.

Shot, the name given to solid projectiles fired from guns. In the time of Henry V stone shot was used, later leaden shot, then iron, and finally steel, introduced by Sir Joseph Whitworth.

Shrike, a large and varied family of birds of hawk-like behaviour found in all continents except S. America. The Red-backed Shrike, which winters in Africa, is a breeding visitor to England and Wales. It is commonly called the "Butcher Bird" from the way it impales its prey (small birds and insects) on thorn-twigs.

The other species on the British list are the Great Grey Shrike, the Lesser Grey Shrike, the Woodchat Shrike, and the Masked Shrike.

Shrove Tuesday, the day before the first day of Lent, receiving its name from the old custom of shriving, or making confession, on that day. In England the day has always been associated with the making of pancakes.

Silence, Tower of, or *dakhma*, a tower about 8 m high, built by the Parsees for their dead.

Silicon, an important non-metallic element, no. 14, symbol Si, it is related to carbon. Next to oxygen, it is the most abundant constituent of the earth's crust (27% by weight). It occurs in many rocks, and its oxide occurs in many forms (*e.g.* quartz, sand, flint, agate, chalcedony, opal, *etc.*). Principally used as a semi-conducting material for making transistors and similar devices. The circuitry of the computer is etched on a chip of silicon.

Silicones are synthetic organic derivatives of silicon which because of their high resistance to heat and moisture have special uses, *e.g.*, lubricants, heat-resistant resins and lacquers, and water-repellent finishes. Silicones are compounds in which the molecules consist of chains of atoms of silicon and oxygen alternately. Silicones were developed in the United States from discoveries first made by Prof. F. S. Kipping at Nottingham University. Manufacture began in Britain in 1950, and in the form of fluids, resins, rubbers and greases they find wide use in industry.

Silk, the name given to a soft glossy fabric manufactured from the fine thread produced by the silkworm. It was known to, and highly prized in antiquity, being at one time paid for, weight for weight, with gold. The manufacture of silk was carried on in Sicily in the 12th cent., later spreading to Italy, Spain and France, where Lyons has been the great centre of production from 1450 to this day. It was not manufactured in England before 1604; but when certain French refugees established themselves at Spitalfields in 1688, the industry was developed and became of importance. In the 18th cent. the Lombes of Derby achieved great success in this industry.

Japan, China, Italy, and Korea are the chief silk-producing countries. Silk was first produced in ancient China *c.* 2,640 B.C.

Silk Road. A network of great trading routes which linked China to the Mediterranean. A constant flow of goods, wealth and culture (as well as diseases) spread along the route.

Silkworm, the larva of a species of moth, *Bombux mori*. It is native to China, and has been cultivated with success in India, Iran, Turkey and Italy. The silkworm of commerce feeds on mulberry leaves and produces a cocoon of silk varying in colour from white to orange. The cocoon is the silken habitation constructed by the worm for its entrance upon the pupal condition, and to obtain the silk the pupa is killed by immersing in hot water.

Sill, a sheet-like mass of igneous rock which has been intruded parallel with the stratification of the country rock, *cf.* a dyke.

Silurian. This geological period is one of the major subdivisions of the Palaeozoic era. Its beginning is estimated at 440 million years ago, and the period lasted about 40 million years. Maximum thickness of the Silurian strata in Britain measures 4,575 m.

Silver, a white precious metallic element, no. 47, symbol Ag (Latin *argentum*) found in a free state, also in certain combinations, and in a variety of ores. The chief silver-producing regions are the Andes and Cordilleras. Peru, Bolivia and Mexico have yielded vast supplies of the metal since the 16th century, and Colorado and Nevada in the United States have also been very prolific. Today, Mexico is the world's largest silver producer.

In England standard silver (that used for coinage) formerly contained 92½ per cent. fine silver and 7½ per cent. alloy, but when the price rose to 89½*d*. per oz and the coins became worth more than the face value, the Coinage Act of 1920 was passed, reducing the fineness to half.

To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America, it was decided in 1946 to replace the United Kingdom silver coinage by one made of cupro-nickel (75 per cent. copper, 25 per cent. nickel). Maundy money, however, is of the original silver standard. Silver chloride and bromide are used in photography.

Simony, the offence of trading in church offices, has been contrary to English law since the time of Edward VI. Elizabeth also promulgated laws against simony. Strict laws still exist.

Sinn Fein (*Irish* = ourselves alone), Irish nationalistic movement founded in 1905 which developed into a mass republican party and triumphed in the establishment of the Irish Free State.

A continuing group survived which represents politically the outlawed IRA. In Northern Ireland Sinn Fein was legalized in 1974 and is now a mainstream political party.

Sins, The Seven Deadly or Capital Sins are pride, avarice, lust, anger, gluttony, envy and sloth.

Sirius, the dog-star, so called because of its situation in the mouth of the Dog (Canis Major): it is the brightest star in the sky, and is also one of the nearest to us.

Sirocco, a warm, southerly, often dust-laden, wind blowing across Mediterranean lands from the Sahara, in advance of an eastward-moving depression over the Mediterranean.

Siskin, a small bird of the finch family, common in Northern regions, nesting in Britain. The common Siskin has a yellow-green colour and is a lively, swift-flying bird with a stout bill.

Sistine Chapel, the chapel of the Pope in the Vatican, renowned for its frescoes by Michelangelo.

SI Units (*Système International d'Unités*) form an internationally recognised system of metric units for scientific and technical quantities. The basic units of length, time, mass, electric current, temperature, amount of substance, and luminous intensity are, respectively the metre, second, kilogram, ampere, kelvin (*see* **Absolute Temperature**), mole (*see* **T24**) and candela.

The SI was agreed for general adoption by a number of international organisations such as the General Conference on Weights and Measures (1960). Most countries have made or are making the SI the only legally recognised set of Units. *See also* **T58–61.**

Skate. *See* **Ray.**

Skink. The skinks constitute a large family of lizards with large smooth scales, under each of which is a bony plate. The largest species, found in Australia, is about 61 cm long. Some skinks have adopted a burrowing habit and degeneration of the limbs is associated with this. The Common Skink is a small species *c.* 12 cm long, living in deserts of N. Africa.

Skua, falcon-like marine birds related to the gulls found throughout the world. Known as "Robber Birds" because they steal not only the young and eggs of other birds but also their food. The Arctic Skua breeds as far south as Scotland. The Great Skua breeds in both Antarctica and Arctica. Other species are the Pomarine, the Long-tailed, and McCormick's Skua.

Skunk, a North American mammal of the weasel family, with short legs and long bushy tail. All fifteen species are black and white, some being striped and the rest spotted. It secretes and ejects at will a potent foul-smelling fluid.

Sky. The blue colour of the sky on a summer's day is the result of the scattering of light waves by particles of dust and vapour in the earth's atmosphere. Blue light having almost the smallest wavelength in the visible spectrum (0·00004 cm) is scattered laterally about 10 times as much as the red (0·00007 cm).

Skylark. *See* **Lark.**

Skyscraper. Owing to lack of ground space, and increasing cost of land, buildings are being made higher than broader; hence the name. The structures are constructed of steel framework usually clothed in concrete or reinforced concrete.

The first modern skyscraper was the Home Insurance Building in Chicago, designed (1883) by William Le Baron. The New York skyscrapers include the Empire State building (102 stories), Chrysler (77 stories), Rockefeller Center (70 stories), and 60 Wall Tower (67 stories). The World Trade Center building (110 stories) was destroyed in the September 2001 terrorist attack. It will be replaced by the Freedom Tower.

Even taller than any New York skyscraper is the Sears Tower, Chicago (447m). The Petronas Towers in Kuala Lumpur (opened in 1996) reach 450 m (1477ft). Even taller is the Shanghai World Finance Centre, China. Opened in 2008, at 492 m high it is the highest skyscraper in China. The tallest of all is the Burj Khalifa (Dubai) (828m), opened in 2010. All of these will be topped by the planned Kingdom Tower in Jeddah, Saudi Arabia (1 km, 3,280ft high, due to be finished in 2020).

The tallest completed building in the UK used to be the 50-storey Canary Wharf tower (243·7m), visible from 20 miles away in Kent. It overtook Tower 42 (formerly the NatWest Bank tower) (183m) and the BT radio tower (177m). It has now been overtaken by the London Bridge Tower (the 'Shard of Glass'), which on completion in 2012 was the tallest (1,017 ft) in the European Union. Hong Kong boasts over 1220 skyscrapers. The tallest *structure* in Britain is the IBA mast at Belmont, Lincs.

The tallest *residential* building in the world is the Trump World Tower in New York, but Dubai plans a 2,332ft apartment block (Dubai One).

The tallest public viewing tower in the UK is the Spinnaker Tower (360ft) in Portsmouth.

Slate, fine-grained clayey rocks which have undergone metamorphism. They cleave easily, and it is this property of cleavage which makes them a valuable source of roofing material. Important quarries producing mainly green slate are in the Coniston–Ambleside area of the Lake District.

Slavery. In its earlier forms, as in the times of ancient Greece and Rome, in the feudal ages, when vassalage and villeinage existed, and in the serfdom of Russia and other northern nations, slavery was attended by many inhumanities and evils; but perhaps in the slavery system which prevailed in the British colonies for upwards of 200 years and in certain parts of the USA up to 1865, it attained its highest point of inhumanity.

In 1833 the Act of Emancipation was passed, emancipating all slaves in British territories, though slavery continued to be practised in parts of Africa (*e.g.* Mauritania) long after that date.

Concern about widespread forms of slavery has led in Britain to the passing of a landmark Modern Slavery Act and the appointment of the first Independent Anti Slavery Commissioner (currently Kevin Hyland). There are still even today an estimated 36 million people living in servitude in the world (around half of these are in India).

Slide Rule, an instrument which consists of two logarithmic scales sliding alongside each other. By its use multiplication, division, extraction of roots, *etc.*, are speedily carried out.

Sloes are blackthorn berries, a wild autumn fruit. The sloe shrub has savage thorns. Sloe gin remains a popular Christmas beverage.

Sloth, a curious family of nocturnal mammals, only found in Central and South America. They dwell almost entirely in the trees, proceeding from branch to branch with their bodies hanging downwards, their weight being supported by their large hook-like claws. They eat foliage. Their reputation for slothfulness is wildly exaggerated but their body is totally adapted to save energy.

Slow-Worm, a species of lizard found in Britain which lacks legs. Silver with longitudinal brown stripes, it lives almost entirely on slugs.

Smelting. The process of heating an ore with a reducing agent to convert ore into metal, and with a flux to convert rocky impurities into a slag that will float on top of the molten metal. Slag and metal can then be tapped separately. An example is iron smelting; the reducing agent is coke, and limestone is added as the flux; the smelting is carried out in a blast furnace.

Smoking. *See* **Tobacco**.

Snake. The snakes constitute the important reptilian order *Ophidia*. Snakes have a scaly, cylindrical, limbless body, lidless eyes, forked tongue, and the upper and lower jaws joined at the chin by an elastic ligament. Most (but not all) snakes have teeth used for seizing prey, and the poisonous varieties are furnished with poison fangs in the upper jaw. Snakes use their forked tongue not only to taste but to smell their prey. It is now known that giant snakes' homing instinct is due to the earth's magnetic field.

Over 2,500 species of snakes are known, divided into 13 families. Some, such as the Black Mamba and Egyptian Cobra, are deadly to humans. There are 3 British species—the grass-snake, smooth-snake and adder. The adder is the only venomous snake in the UK. Global stocks of snakebite anti-venom are running low.

Snipe, a wading bird, long-legged, with a long, slender, straight bill, brown plumage, and zig-zag flight. The Common Snipe breeds locally throughout Britain; the Great Snipe and small Jack Snipe are occasional visitors. The close season is 1 February to 11 August.

Snow. When water vapour condenses at high levels at a temperature below freezing (sublimation), a cloud of ice particles is formed. If these frozen droplets are small, they fall slowly and gradually assume a feathery crystalline structure, reaching the earth as snowflakes if the temperature remains below freezing. There are 121 different types of snowflake, but no two snowflakes are identical. Every snowflake that has ever fallen is unique.

Snowdrops, One of our most loved flowers, but not native to Britain (they came from Italy).

Snow Leopard. *See* **Ounce**.

Snuff, the generic term for fine-ground smokeless tobacco. The habit is now more popular again.

Soda, carbonate of sodium, is now mainly obtained by certain processes of manufacture from common salt. It was formerly obtained from the ashes of plants. Bicarbonate of sodium is the primary product in the Solvay or Ammoniasoda method for commercial manufacture of soda; it is also formed when carbon dioxide is passed into strong soda solution. The bicarbonate is used in medicine and in the preparation of baking powder.

Sodium, a metallic element, no. 11, symbol Na (Latin *Natrium*), first obtained by Sir Humphry Davy in 1807 from caustic soda by means of the electric battery. Its chloride is *common salt*; the deposits of salt (*e.g.*, in Cheshire and at Stassfurt) have come into existence through the drying up of inland seas. Salt occurs in sea-water to the extent of about 3 per cent.; the Dead Sea contains about 22 per cent. The blood of animals is maintained at a level of about 0·6% sodium chloride. Sodium in the sun's atmosphere was confirmed in 1859 by Kirchhoff from his spectroscopic observations.

Liquid sodium metal has properties which make it suitable as a coolant in some nuclear reactors; a technique of handling this very reactive liquid has had to be developed.

Soil Erosion occurs when the soil is removed from an area at a faster rate than soil formation. This situation usually occurs as a result of man's interference with the natural balance of the environment by the removal of natural vegetation, overgrazing or by poor farming techniques. Soil thus exposed is then removed by the wind (as in the Dust Bowl in the 1930s) or by rain in the form of gully or sheet erosion (as in the Tennessee Valley, USA). Methods introduced to stop soil erosion include contour ploughing, afforestation and dry farming techniques.

Solar Battery, one of the innumerable devices made possible by the development of semiconducting materials, notably germanium and silicon. This device creates an electric current from light falling on it. The current can be put to use or stored in storage batteries. The energy of the current is derived from the sunlight. The solar battery is thus an *energy converting* apparatus. Solar batteries have provided power for the instruments in satellites.

Solar Corona. *See* **Corona**.

Solar Eclipse, *See* **Eclipse**.

Solar System, the system dominated by the Sun, containing the major planets and their satellites, the plutoids (dwarf planets), the asteroids, comets, meteoroids, interplanetary gas *etc. See* **T3**.

Solar Wind, a continuous stream of electrically charged particles blowing outwards from the sun, supplemented from time to time by intense outbursts from regions of the sun's surface. These streams of protons and electrons on encountering the earth's magnetic field distort it and cause magnetic storms (*q.v.*) and aurorae.

Soldering is a means of joining together two pieces of material, usually metals, by melting a third metal (the solder) into the joint. The solder solidifies in the pores of the other metals and holds them together. The materials to be joined are not themselves melted so the technique requires less heat than welding. Solders are alloys; there are many kinds depending on the materials to be joined and the strength of joint desired. *See* **Welding**.

Solstice, the point at which the sun is most distant from the equator.

Solvents. The abuse of solvents such as glue, paints, *etc.* has grown among teenagers. Solvent abuse can lead to brain damage and dependence.

Soundings at sea, to determine depth at any point, have been taken in all seas, and with considerable accuracy. A deep reading was that of the *Challenger* expedition in 1873, near St. Thomas's in the North Atlantic, when 3,875 fathoms (7,091 m) were sounded. In 1851 H.M.S. *Challenger* recorded the then maximum ocean depth in the Marianas Trench (W. Pacific) by echo-sounding as between 5,882 and 5,950 fathoms (10,764 and 10,800 m). Another deep was located in the S. Pacific in 1952–53 of 5,814 fathoms (10,640 m) in the Tonga Trench, 290 km S. of Tonga Tabu. Since then greater depths have been recorded, in the Marianas Trench and the Mindanao Deep. *See* **Pacific Ocean.**

Southern Cross, popular name of *Crux*. It is the smallest constellation in the entire sky and can be observed from latitudes below +30°. Its four brightest stars form a conspicuous Latin cross. It is now known to have 8 stars. The constellation is a vital guide to seafarers.

Sovereign Support Grant. *See* **Civil List.**

Soviet Union. *See* **Union of Soviet Socialist Republics.**

Space Flight. The Soviet Union was the first country to launch a man into space and bring him safely back to earth. This epoch-making event took place on 12 April 1961, when Yuri Gagarin, tragically killed in an air crash in 1968, circled the earth in a spaceship weighing about 4,826 kg. It was launched by rocket in an elliptical orbit with greatest height 300 km and least 175 km. From that time on, both Russians and Americans completed ever longer times in space. Lovell and Aldrin (60 orbits) were among the first to complete successful missions in space. Leonov was the first to perform an extra-vehicular (EVA) experiment (1965).

Russia was the first to achieve an automatic docking (link-up) between two unmanned spacecraft in orbital flight (October 1967), and of two unmanned spacecraft (January 1969). The American *Apollo* mission was accomplished when Armstrong and Aldrin became the first men to set foot on the moon (July 1969). A joint Soviet-American project culminated in a *Soyuz–Apollo* link-up 225 km up on 17 July 1975. On 11 January 1978 two Soviet spacecraft docked with an orbiting laboratory, the first triple link-up in space.

The first free walk in space was made by two American astronauts on 7 February 1984 from the space shuttle *Challenger*.

The *Challenger* disaster in 1986 disrupted America's space programme. *Challenger* has been succeeded by *Endeavour*, the most technologically advanced shuttle yet developed.

In 1991, Helen Sharman became the first Briton in space, whilst in 1995, Michael Foale became the first Briton to walk in space. The first "official" walk was by Major Tim Peake in 2016. In 1995, the Russian cosmonaut Valeri Poliakov broke the existing record for the longest continuous time spent in space when he completed 438 days aboard the Mir space station. The current world record is held by the Russian Gennady Padalka who has spent 879 days in space spread over five missions. The US astronaut Shannon Lucid spent 188 days and 5 hours in space in 1996, a record for a woman.

The loss of the US space shuttle *Columbia* in February 2003 was a very serious setback. In October 2003 China became the third nation to send a man into space.

Since the Space Age began in 1957 over 6,500 satellites and spacecraft had been launched from over 30 countries by 2012. Over 500 people from 40 nations have gone into space. However, a massive amount of debris is now orbiting Earth from these activities.

Space Research. By space research we mean scientific research work which can only be carried to otherwise inaccessible observing locations by rocket propulsion. Such propulsion does not rely on the presence of an atmosphere to provide oxygen so that it is capable in principle of conveying objects to unlimited distances.

Space research is not a single discipline, but can provide data of great importance for many, such as the physics of the earth, the sun, moon and other bodies of the solar system, astronomy, geodesy and the study of gravitation. The prospect of investigating the biological conditions on different planets such as Mars and Venus is also opened, as well as that of experimental biological studies under conditions of zero gravity.

During recent decades both the American and Russian space programmes have developed the concept of space stations. There have now been successful soft landings on Mars and Venus, and "fly by" visits to Jupiter and Saturn. Voyager 2 (*q.v.*) left Saturn in 1981 visiting the planets Uranus (1986) and Neptune (1989) and continuing beyond.

The launching of the Galileo probe into the atmosphere around Jupiter late in 1995 greatly increased our knowledge of that planet. The Cassini Mission to Saturn was launched in 1997.

NASA probes to search for evidence of past life on Mars successfully landed in January 2004. The Rosetta Space Mission successfully linked up with a comet in 2014. More recently Pluto was visited by the New Horizons spacecraft in 2015.

A host of deep space missions have been recently launched to investigate the nature of our universe including X-ray, UV and Gamma-ray space telescopes (*see* **European Space Agency**) as well as the microwave telescopes launched by NASA (MAP) and ESA (PLANCK) between 2000 and 2007 respectively.

Space Shuttle. The first reusable manned space vehicle, *Columbia*, was launched on 12 April 1981 from Cape Canaveral, Florida. It orbited the earth 36 times and returned on 14 April landing in California after a flight of 34 h 22 min. The 1986 *Challenger* shuttle exploded and in 2003 *Columbia* broke up on re-entry. The space shuttle made its final mission in 2011. *See also* **Space Flight**.

Spacetime, the single physical entity into which the concepts of space and time are unified such that any event can be specified by four coordinates, three giving the position of space and one the time. The concept was used by Einstein in both the special and general theories of relativity.

Sparrow, name given to finch-like birds found in most parts of the world, of which the House Sparrow *Passer domesticus*, is the most familiar of British birds. Also native to Britain is the rural Tree Sparrow, distinguished from the male House Sparrow by its chestnut crown. Other European species are the Italian, Spanish and Rock Sparrows. House sparrows are in decline, in part because houseowners are filling gaps in their eaves through which birds gained access to the roof.

Specific Gravity, the ratio of the mass of a particular volume of a substance to the mass of an equal volume of water at 4°C. *See* **Hydrometer.**

Spectral Classification, the different groups into which all stars such as our Sun may be classified. The majority of stars can be divided into seven spectral types O, B, A, F, G, K, M. O type stars are the hottest and M the coolest. The stellar types are subdivided into 10 subclasses denoted by the digits 0 to 9. Our Sun is a G2 star.

Spectrograph. An instrument used to separate and record spectral components of light or other radiation. They are a crucial astronomical tool for analysing the physical processes and composition of stars and other celestial objects. *See below.*

Spectroscopy. Newton's arrangement with the prism was the first spectroscope; its function was to separate out the colour components of a source of light. Two hundred years elapsed before this apparatus was developed into a precise scientific instrument, capable of measuring both the wavelength and intensity of each colour component. In this form it is called a spectrometer. All atoms and molecules have well defined characteristic spectra which can be used to recognise them. In order to produce emission spectra it is necessary to energise the material under investigation by some means, such as by heating in a flame. The resulting radiation then consists largely of sharp bright lines, characteristic of the material. Absorption spectra are produced by interposing the experimental material between a white light source and the spectrometer. Then dark lines are seen, corresponding to absorptions of energy, in exactly the same places as the bright lines are observed in the emission spectra.

Spectroscopic techniques have now been developed to such an extent that accurate measurements of wavelength and intensity are possible not only in the visible region, but over almost the whole of the electromagnetic spectrum. Two of the most useful types for the chemist are infrared spectroscopy which reveals absorption characteristic of the type of chemical bonds because of their different bond vibration frequencies and nuclear magnetic resonance spectroscopy which operates in the radiofrequency region. It reveals the structure environments of atoms containing particular nuclei.

Not only does spectroscopy play an important rôle in probing the structure of matter, but it can be applied in the field of astronomy. The use of radio wave spectroscopy has led to the discovery of several new types of stellar object.

Spelaeology. *See* **Caves.**

Sphenodon. *See* **Tuatara.**

Spiders. *See* **T36(1)** under arthropods.

Spirituals, Afro-American melodies with religious inspiration and which are still spontaneously created, but have also passed into art-music.

Sponge. *See* **Porifera, Section T.**

Spoonbill, a long-legged, marsh bird, closely related to the ibis and stork, remarkable for its snow-white plumage and broad, flat, spoon-shaped bill. The European species has not bred in England since the beginning of the 17th cent., but is still a regular summer visitor from the Netherlands, where it nests in colonies in reed beds and islets.

Sputniks, the name of the Russian earth satellites first launched in 1957. *Sputnik I*, launched 4 October 1957, became the first man-made earth satellite. *Sputnik II*, launched a month later carried a dog as passenger. *Sputnik III*, launched in May 1958, was the first space laboratory.

Squirrels. The red squirrel is our only native squirrel. Except in Scotland (where there are over 100,000) numbers have plummeted since the introduction of the grey squirrel from North America.

Stalactites are deposits of calcium carbonate formed on the roofs and sides of limestone caves, and in tunnels, under bridges, and other places where the carbonic acid of rain-water percolates through and partly dissolves the limestone, resulting in the growth of icicle-like forms that often assume groupings. The water that drops from these may deposit further calcium carbonate, which accumulates and hardens into sharp mounds or hillocks called *stalagmites*. These can reveal climate history.

Standard Deviation. In statistics it is often desirable to compare the variability or "spread" of different sets of data. For example, two kinds of light bulb could have the same average life but one kind could be more uniform or consistent than the other. The standard deviation is one of the commonest measures of spread.

It is found as follows. If x is one of the data and $\bar{x}$ is the mean of all the x's, then $x - \bar{x}$ is called the deviation. Every deviation is now squared and the average squared deviation calculated. The standard deviation is then the square root of the average squared deviation.

The lifetimes of the more uniform kind of light bulb would have a smaller standard deviation than those of the more erratic one.

Starboard. The right-hand side of a ship.

Starling (*Sturnus vulgaris*), a well-known European bird now common in many parts of the world. It has handsome iridescent blackish plumage and nests in holes and crevices. Flocks of starlings (murmurings) can be seen wheeling in the air; thousands roost on buildings in the heart of London. Other European species are the Spotless and Rose-coloured starlings. The latter sometimes wander to the British Isles. Starling numbers have decreased in recent years.

Statue of Liberty, presented to the USA by the Frenchman Ferdinand de Lesseps in 1884.

Steam Engine, a machine whereby steam becomes the active agent of the working of machinery, and of very wide application. The leading types of steam engine are: (*a*) condensing, or low-pressure engines, where the steam is generated by a boiler; (*b*) non-condensing, in which the cylinder exhausts its steam into the open air. Engines of the latter type are used where portable engines are required.

Steam-Hammer, invented (1839) by the Scottish engineer James Nasmyth. Consists basically of a vertical steam cylinder atop two legs with piston-rod passing through cylinder base and attached to a tup (hammer) of from 100 kg to 15 tonnes which rests on an anvil. The tup slides in V grooves on inside of legs. Length of stroke and therefore weight of blow can be accurately controlled from a light tap to a massive punch.

It made possible the forging in one piece of multi-throw crankshafts for marine engines, *etc.* and the mass production of high-class axles and wheels, con rods and buffers, *etc.* for locomotives and rolling stock.

Stearin is the portion of fatty matters and oils which remains solid at an ordinary temperature, and is a compound of stearic acid with glycerine. It is largely used in the manufacture of candles. With caustic soda stearin forms a soap (sodium stearate), which is present in most commercial soaps which contain sodium palmitate and oleate in addition.

Steel, an alloy of iron and carbon, with varying proportions of other minerals. The famous blades of Damascus and steels of Toledo were made by the cementation and crucible method. The metal produced by the "Bessemer process" (*q.v.*) is of great value for structural purposes, rails, *etc.*

The technique known as continuous casting bypasses some major steps in the conventional process of steel-making.

Stereophonic Broadcasting. A person having normal hearing is able to determine the direction from which a sound reaches him by virtue of the fact that he has two ears, and, therefore, the sound will reach one of them a fraction of a second before it reaches the other. This difference in arrival time allows the brain to calculate direction.

Stereophonic broadcasting restores the listener's ability to locate the position in space of the various sources of sound and to follow movement (just as if he or she were in a concert hall).

To do this it is necessary to use two microphones in the studio—to simulate the two human ears—and to transmit their outputs, through two similar, but separate, chains of equipment, to two radio receivers and their two loudspeakers, which must be placed some distance apart, in the listener's home.

The main work on two-channel stereophony was done by A.D. Blumlein (1903–42), his original patent being dated 1931.

Stereotype, a metal cast taken from movable type which has been set up in the ordinary way. The first to introduce the process in practical form in this country was William Ged of Edinburgh in 1730. An impression of the type matter is first taken by means of a mould of prepared plaster of Paris or moistened sheets of specially prepared paper and when molten stereo metal is poured upon the mould and allowed to cool and harden, the stereo plate is formed, and can be printed from as a solid block for some time.

Steroids. A class of structurally related compounds, based on a system of condensed rings of carbon and hydrogen, which are widely distributed in animals and plants. Included in the steroid family are sterols, found in all animal cells, vitamin D, sex hormones, bile acids and cortisone.

Stickleback, a family of small spiny-finned fish widely distributed in both fresh and salt water. Male constructs roofed nest held together by sticky secretion from glands near kidneys. Several females deposit eggs therein which he guards until after young are hatched.

Stirrup, a loop of metal 7-shaped strap suspended from the sides of the saddle, used for mounting and to support the horseman's foot. They were used as far back as the early Iron Age, and it is believed that they were used in battle in Europe in A.D. 378, when the Gothic cavalry defeated the legionaries of the Emperor Valens at Adrianople. Stirrups relieved the tension of the rider's knees and so enabled him to be armed from top to toe.

Stoat, a slender, carnivorous mammal with short legs, related to the weasels. The stoat is distinguished from the latter by its longer tail, which has a black tip. The black tip is retained even in the winter when the animal turns white, the fur then being known as "ermine". It is found in northern latitudes, and is abundant in Arctic America. A stoat can take on a rabbit twice its size.

Stoma (pl. **Stomata**), microscopic pores on the surfaces of leaves through which gaseous exchanges take place and water is lost. It is estimated that a single maize plant bears 200 million stomata, usually closed at night.

Stone of Scone. *See under* **Scone.**

Stone-Flies, comprise the order of insects called *Plecoptera*, which includes some 700 species, of which about thirty occur in Britain. The wings are membranous, and two long, thread-like feelers protrude at the tail end. The larvae are aquatic.

Stork, a family of heron-like birds with long bills, freely distributed over Europe, Asia, Africa and S. America. The White Stork is an occasional visitor to England, and, more rarely, the Black Stork; these are the only two European storks.

Stratosphere, a layer of the earth's atmosphere which lies between the tropopause (*c.* 12 km above the earth) and the stratopause (*c.* 50 km). The ozone layer lies within the stratosphere and is responsible for the relatively high temperature there. The region is less turbulent than the troposphere, and is usually clear of clouds *etc*, making it attractive for air transport.

Stratum (pl. **Strata**), a bed or layer of rock.

Strontium. This silver-white metallic element, no. 38, was discovered by Hope and Klaproth in 1793, and isolated by Sir Humphry Davy in 1808. The chief strontium minerals are celestite (sulphate) and strontianite (carbonate). Compounds of strontium give a brilliant colour to fireworks and signal flares. Radioactive isotopes of strontium (strontium-90) are formed as fission products in nuclear explosions and tend to collect in bone on account of the chemical similarity of strontium and calcium. *See* **Fall-out.**

Stuart. The Scottish dynasty which provided England with its monarchs from 1603 to 1688 (James I, Charles I, Charles II and James II).

Sturgeon, a large fish found in northern seas and rivers with five rows of bony plates along the back and sides and pointed mouth with four barbels. Caviar (traditionally eaten with an ivory spoon) is prepared from sturgeon ova. The Caspian sturgeon is now a fast-disappearing species (because of over-farming). Pollution threatens the wild Chinese strugeon of the Yangtze River. In 2006 a ban was announced on the international trade in caviar. There are 27 species of sturgeon.

The once common Atlantic sturgeon is now only found in the Garonne in France.

Sublimation, when a solid substance is heated and turns into vapour without passing through the liquid stage and then condenses as a solid on a cold surface, it is said to "sublime" and the process is called "sublimation". Iodine behaves in this way, and sublimation is used as a method of purifying it.

Submarine, the first submarine, the *Nautilus*, was designed by Robert Fulton and tried out in the river Seine and in the sea off Brest in 1801. The idea was too revolutionary to find acceptance and it was not until electricity for under-water propulsion became available that the submarine underwent extensive development. Britain became interested around 1901 and the Germans developed it and made it into an instrument of warfare. The first voyage under the North Pole was made in 1958 by the American nuclearpowered submarine *Nautilus*. The Government in March 1982 decided to replace the Polaris force with a new fleet of

Trident II submarines at a cost of £7,500m. The first Trident submarine, HMS *Vanguard*, was launched in 1992. The fourth (and final) Trident submarine was launched in September 1998. In 2010 the Coalition Government said that Trident would remain in service until 2028. The current Conservative Government plans a £41 billion replacement to be in service *c.* 2030.

Women have been allowed to serve in Royal Navy submarines since 2013.

Submillimetre Astronomy, the branch of astronomy that deals with the wavelength range 0·3 to 1 millimetre. It is the highest frequency range in which radio astronomy can be carried out and is particularly important because of the large number of molecular emission lines found in this range.

Su Doku. The modern Su Doku puzzle was invented by American architect Howard Garns in 1979. It was taken up by a Japanese publisher in the 1980s. The original puzzle format derives from the "Latin Squares" idea of the famous Swiss mathematician Leonard Euler (1707–83) and was very popular in France after 1895.

Suez Canal, connecting the Mediterranean and the Red Sea, was built by the French engineer Ferdinand de Lesseps and opened in 1869. An Egyptian company, *Canal Maritime de Suez*, was formed in 1866 with a capital of 200 million francs. The British Government acquired 176,602 shares out of a total of 400,000 for £4 million. Under the Convention of 1888 all nations were granted freedom of navigation without discrimination in peace or war. The right was recognised by Egypt in the Anglo-Egyptian Agreement of 1954, under which Britain agreed to give up the Suez base. The Suez Canal Company was nationalised by the Egyptian Government without warning in 1956, since when it has been widened and deepened and the average time of transit reduced. In 2014 work began on a massive new channel to be dug alongside the existing canal. This was opened in 2015, allowing two-way traffic on the waterway.

Suffolk Punch, once one of the most popular draught horses working the land. The UK's oldest native horse, but its future is under threat.

Sugar, to the chemist the term is a generic one covering a group of carbohydrates, including cane sugar (sucrose), glucose, fructose, and maltose. In ordinary parlance sugar means sucrose, which is obtained from the sugar cane, sugar beet or sugar maple. Natural unrefined cane sugar—sometimes called *muscovado*, the Portuguese word for unrefined—is brown.

Sulphur, element no. 16, is a brittle, crystalline solid, symbol S, abounding in the vicinity of volcanoes. It is yellow in colour. It occurs in combination with other elements, as sulphates and sulphides, and allied with oxygen, hydrogen, chlorine, *etc.*, is of great commercial utility. Used in its pure state it constitutes the inflammable element in gunpowder; it is also used for matches and for making sulphuric acid.

Sulphuric Acid, a compound of great commercial importance, used in many manufactures, and composed of sulphur, oxygen and hydrogen. Extremely corrosive, and is present in acid rain (*q.v.*).

Sumptuary Laws. Medieval attempt to maintain stability by imposing consumer laws on different orders in society. The wives of merchants were forbidden to dress in the style of wives of the nobility, and clergy were not allowed to wear the clothes of the laity.

Sun, the centre of our solar system, is only one of many billions of stars in our galaxy. The earth orbits the sun, which has a diameter of 1·39 million km, at a distance of 149·6 million km. The sun thus has a volume a million times that of the earth. At the surface, the gravitational field is 28 times that at the earth's surface. It rotates on its axis from east to west, though not as a solid, the solar equator turning once in about 25½ days and the poles in about 34 days.

Large spots are observed on the sun which form and disappear at irregular intervals. The area of the disc covered by the spots, however, reaches a maximum roughly every 11 years, when the sun's heat seems rather greater than usual and magnetic storms more frequent (sunspot cycle). Spectrum analysis shows that the sun is composed of many elements found in the earth. Its surface temperature is *c.* 5,500°C.

The earth is in the outer atmosphere of the sun and subject to its winds and storms. The apparently inexhaustible heat of the sun, which has maintained life on the earth for millions of years, is derived from the destruction of matter, involved in the transmutation of hydrogen nuclei into helium nuclei, in which process about four million tonnes of matter are destroyed every second. At this rate of conversion the sun will go on radiating for 30,000 million years. Eventually, billions of years from now, our Sun will become a death star, having first swollen to 250 times its present size.

Modern research has shown that the Sun blows out bubbles—known as coronal mass ejections (CMEs)—every few days at a speed of 90,000 miles an hour. These can wipe out satellite communications and bring down power systems on Earth. The interior of the Sun is also more strange than suspected. Astronomers have found that, while the Sun's surface is resonating, regions below the surface appear to be smooth and flat. Eventually, in 6 billion years time, the Sun will expand into a red giant and burn up the Earth.

Our knowledge of the Sun has been transformed by the Solar Heliospheric Observatory (SOHO) and Ulysses satellites launched in 1995 and 1990 respectively. SOHO has been studying the Sun's internal structure and processes which form and heat the solar corona that give rise to the solar wind. Ulysses has examined the solar wind especially over the polar regions.

In 2010 the Solar Dynamics Observatory was launched to examine the solar magnetic field during a 5-year mission. A new mission, Solar Orbiter, is planned for 2018. One of the mysteries to solve is why the corona (outer atmosphere) is hotter than the surface. *See* **T8–9**.

Sunday. *See* **Sabbath**.

Superconductor, a metal in a state in which its electrical resistance has entirely vanished so that electric currents can flow indefinitely without generating heat or decreasing in strength.

The superconducting state of metals was first discovered in mercury by Onnes in Leiden in 1911. There are many magnetic and thermal properties associated with superconductivity and the phenomenon as a whole has proved to be of great scientific interest.

Many metals and alloys were found to show the property but only at very low temperatures—below *c.* −260°C. There is a growing number of practical applications, *e.g.*, coils of superconducting wire (kept very cold by liquid helium) can be made to carry enough electric current to produce strong magnetic fields. Such fields are very constant and do not require the large supply of electrical power that ordinary electromagnets need. By the 1990s, scientists were on the point of developing a revolutionary material that would superconduct (*i.e.* lose all electrical resistance) at *room temperature*.

Supernova. These huge stellar explosions are caused when white dwarves (the collapsed remnants of old stars) either collide or merge. This explosion blows off most or all of the star's outer regions and is the result of an uncontrolled nuclear reaction in the core. The core of the supernova may go on to form a neutron star or black hole.

Observationally, supernova have been divided into two groups, based on the absence (type I) or presence (type II) of hydrogen. Recent observations have revealed a rich diversity of types and so sub-classifications have occurred. Supernova 1987A was the first naked-eye supernova since 1604 and the remnants of the explosion are still being studied. *See* **Neutron Star, Black Hole**.

Supersonic Speed, a speed greater than the speed of sound (in air at sea-level sound waves travel at about 1223 km/h). When a body travels at a speed which is greater than the speed at which disturbances themselves can travel, a mechanism exists for the generation of waves of enhanced intensity. Thus aircraft travelling at supersonic speeds produce shock waves in the air somewhat analogous to the bow waves of fast-moving ships. These shock waves are regions of intensely disturbed air which produce the sonic boom effect so distressing to people living near supersonic routes. *Supersonic* is not to be confused with *ultrasonic* (*q.v.*).

Surface Tension. The surfaces of fluids behave in some respects as though they were covered by a stretched elastic membrane. This property is called "surface tension". The action of detergents may be attributed in part to a reduction in the surface tension of water, allowing it to wet the surface of dirty articles.

Swans, large, graceful birds which together with the ducks and geese form the family Anatidae. There are three European species with white plumage; the Mute Swan distinguished by its orange bill with black knob (less prominent in female), a familiar sight on the rivers and ornamental lakes of Great Britain. Two wild swans are winter visitors here, the Whooper and Bewick's Swan (although Bewick Swan numbers are in decline). The "pen" (female) and "cob" (male) are not as monogamous as once thought. There are around 7,000 pairs of breeding swans. Outside of captivity, swans have an average lifespan of 12 years. The young swans are called "cygnets". The scientific name of a mute swan is *Cygnus olor*.

Swan-upping. The annual census of the Thames swans which takes place during the third week of July. This ancient ceremony dates back to the 12th cent. when all the Thames swans were declared to be Royal birds owned by the Crown.

Two city guilds—the Vintners' and Dyers' Companies—own about a third of the 200 swans now on the Thames. This privilege was granted to them by King Edward IV in return for money.

Sweet Potato. This plant (*Ipomoea batatas*), which is a climbing perennial belonging to the convolvulus family, has thick roots that are rich in starch, and are eaten like potatoes. A native of the W. Indies and Central America, new varieties of sweet potato have been bred which stand cooler climates. The sweet potato of New Zealand is called the Kumara.

Swift, a bird so-called from the extreme speed of its flight, resembling a swallow but related to the humming-bird. It has long, scythe-like wings, sooty-black plumage and greyish-white chin. There are several species inhabiting most parts of the world, particularly the tropics. The British breeding bird is among the latest to return from Africa and the earliest to go. Swifts are the only birds to use saliva for their nests. One oriental species builds its nest entirely from saliva. Swifts are known to fly as high as 10,000ft at night-time. They are in decline because of the growing popularity of home improvements!

Sword, hand weapon of metal used in open combat, characterised by a longish blade. During the Middle Ages the most famous blades were those made by the Arabs at Damascus and in Toledo.

Symbiosis is when two organisms live together and both derive mutual benefit from the association. An example is the symbiosis of an alga and a fungus in lichens; another is the ordinary pea plant and the bacteria which live in the nodules on the pea's roots.

Synapse is the point of association between one nerve cell and another. The nervous impulse travelling along one nerve has to be transmitted to the next across a minute gap. This is the synaptic gap. The mode of transmission is chemical though it was at first thought to be electrical. The impulse arriving at the synapse releases a chemical transmitter which diffuses across the gap and stimulates an impulse in the adjacent nerve cell.

Synod, an assembly of the clergy of a particular church, state, province, or diocese. The Synod of Whitby (664) settled the dispute between the Celtic and the Roman churches over Easter in favour of the Roman system of reckoning.

Synoptic Charts. These are meteorological charts used in forecasting on which weather conditions at a network of stations are recorded.

T

Taj Mahal, the white marble mausoleum built at Agra by Shah Jehan in memory of his favourite wife who died 1629. Over 20,000 men were occupied for over 20 years in its erection. Urgent action is needed to protect the Mausoleum.

Takahe or Notornis, large New Zealand bird of the rail family which for many years was believed to be extinct. The bird is strictly protected.

Tantalum, a scarce bluish metallic element, no. 73, symbol Ta, discovered by Ekeburg in 1802. Chemically related to vanadium and niobium, it is usually associated with the latter in nature. For several purposes it can be used in place of platinum, and it finds application in the making of surgical instruments. Tantalum is very hard, and resistant to acids (other than hydrofluoric). Tantalum is a vital component of mobile phones.

Taoiseach, the name for the Irish Prime Minister.

Tapirs. The tapirs constitute a family close to the horse family and the rhinoceros in the Ungulate order. They have four toes on the front feet and three on the hind. The snout is drawn out into a short trunk. The largest tapir is the Malayan tapir, which stands 1 m at the shoulder. Five species occur in C. and S. America, but the Brazilian tapir is very threatened by habitat destruction. The fifth species (known as a kobomani) was only found in 2015 in the Brazilian Amazon.

Tar is a dark viscid product obtained from the destructive distillation of wood, coal, peat, *etc.* Wood tar is acid owing to the presence of acetic acid ("pyroligneous acid"). The highest proportion of coal tar goes into road making. Distillation of coal tar yields many valuable compounds, including benzene, phenol (carbolic acid), naphthalene and creosote; the final residue after distillation is pitch. Based on the chemical manipulation of compounds from coal tar is the preparation of many perfumes, food essences, drugs, antiseptics and plastics.

Tasmanian Devils. About the size of a dog, these are the world's largest carnivorous marsupials. They are threatened with extinction.

Taste. According to the Ancient Greeks, there were four tastes: sweet, sour, salty and bitter. The ancient Chinese added a fifth, namely spicy. Our human brain has specialist neurons for each of five taste categories.

Tate Britain, named after its founder, Sir Henry Tate, at Millbank, London, was opened in 1897; Sir Henry Tate bore the cost of the building (£80,000) and also gave the nucleus of the present collection. "The Turner Wing", the gift of Sir Joseph Duveen, was added in 1910. The Tate Gallery was renamed Tate Britain in March 2000. It has recenly undergone a £45 million transformation.

Tate Modern, which is along the Thames at Bankside, houses contemporary international art works. It was opened on 12 May 2000. A new wing opened in June 2016.

Tay Bridge spans the Tay at Dundee, opened for rail traffic on 20 June 1887. A previous bridge, completed in 1877, was blown down on 28 December 1879, as a train was passing over it. A new bridge was opened on 18 August 1966 for road traffic, 2,244 m in length, the longest road bridge in Britain when it was first opened.

Tea. *See* **R19.**

Teal, the smallest of the European ducks and next to the Mallard the commonest British species. It is a handsome swift flier, but not as swift as the Garganey or Summer Teal.

Telecommunications. The sending of messages over a distance. The term is generally applied to the sending of messages by telegraph, telephone, radio, television or radar. The first submarine telegraph cable between England and France was laid in 1850 and, following Hertz's investigations into electric waves, Marconi's invention led to Britain being linked with Europe by wireless telegraphy in 1899. The first permanently successful telegraph cable across the Atlantic was laid in 1866. The first telephone service between London and Paris was opened in 1891.

The electro-magnetic telephone was invented by Alexander Graham Bell, a Scottish-born American, in 1876.

The first submarine telephone cable to span the Atlantic was laid in 1956 connecting Britain with Canada and the United States.

The spectacular advances in space research depended on the new tools of work provided by parallel developments in telecommunications. *See* **Satellite Communication, Radar, Radio, Television.**

Telemetry, measurement at remote distances by means of a radio-link from the object (missile or satellite) to the ground. The third Russian sputnik, for instance, carried apparatus for measuring, among other things, the pressure and composition of the atmosphere, and the intensity of different kinds of radiation from the sun. Its radio transmitter, powered by solar-energy batteries, sent out the information in coded form by means of uninterrupted signals.

Radio telemetry from inside the body is increasingly used in medical and biological research; miniature radio transmitters can be swallowed or implanted in man or animal to detect physiological conditions.

Teleprinter, a telegraph transmitter with a typewriter keyboard, by which characters of a message are transmitted electrically in combinations of 5 units, being recorded similarly by the receiving instrument, which then translates the matter mechanically into printed characters.

Telescope, an optical instrument for viewing objects at a distance, "the astronomer's intelligencer". Lippershey is credited with construction of the first in 1608; Galileo constructed several from 1609 and Newton was the first to construct a reflecting telescope. The ordinary telescope consists of an object-glass and an eye-lens, with two intermediates to bring the object into an erect position. A lens brings it near to us, and the magnifier enlarges it for inspection. A refracting telescope gathers the rays together near the eye-piece and is necessarily limited as to size, but the reflecting telescope collects the rays on a larger mirror. These are thrown back to the eye-piece.

The world's largest optical reflecting telescopes are the 10m Keck telescope at Mauna Kea in Hawaii (USA), the Very Large Telescope (VLT) located at the European Southern Observatory (ESO) sited on Cerro Paranal in Chile, consisting of four 8m telescopes and the 8m Gemini telescopes on Mauna Kea and Chile. The VLT is itself due to be superseded by the ELT (Extremely Large Telescope), also to be based at ESO.

UK Infrared Telescope (UKIRT) is the world's largest infrared telescope. The mirror is 3·8 metres in diameter. The *Hale* 200 in telescope at Mount Palomar revealed objects never before photographed; it is able to probe space and photograph remote galaxies out to a limiting distance of 2,000 million light years. The *Schmidt* telescope at Mount Palomar has been used to make a huge map of the universe.

Today the largest single radio dish in the world is the non-steerable 300 m instrument at Arecibo in Puerto Rico. Another instrument of radio astronomy is the interferometer which consists of spaced aerials. The biggest of these is in New Mexico. In 1990, the project to put the Hubble Space Telescope into space became reality. The Hubble used gravity to magnify distant galaxies and its findings gave scientists new evidence of the age of the universe. It has peered into space to capture light generated 13 billion years ago.

A new type of telescope named COAST (Cambridge Optical Aperture Synthesis Telescope) has been perfected that can take even sharper pictures than the Hubble. The world's biggest radio telescope, the Very Long Baseline Interferometer, (VLBI), a series of linked instruments stretching from the Caribbean to Hawaii, is now operational. This huge array of detectors is capable of seeing detail equivalent to a postage stamp 7,500 miles away.

In 2015 Jodrell Bank was confirmed as headquarters of the massive Square Kilometre Array (SKA), due to be fully operational by 2025.

Other projects include the European Extremely Large Telescope (E-ELT) which will pick out the pinpricks of light reflected from planets as they orbit stars. It will have a 39·3m (130ft) mirror.

In April 2009 the Kepler space telescope (the biggest camera in space) was launched to search for extra-terrestrial life (it found over 3,500 planets). Its successor in 2018 will be the James Webb telescope, the ultimate cosmos explorer. *See also* **Astronomy, Radio Astronomy, Infra-Red Space Observatory, Space Research** *etc.*

Television, or the transmission of images of moving objects by radio or via the cable and satellite systems. To understand the problems of television it is necessary to consider the action of the human eye. Basically the eye consists of a lens which projects an image of the scene before it upon the retina, a light-sensitive screen at the back of the eye. The retina is made up of several millions of tiny light sensitive elements, each quite separate and distinct from its neighbours, and each separately connected to the brain by an individual fibre in the optic nerve. Thus the eye is a very complex organ, and it is able to pick out numbers of tiny details from a scene and convey each detail separately and simultaneously to the brain. It does not send a blend of different points of light and shade in the same way that the ear sends a blend of different sounds; if it did the brain would receive a completely unintelligible blur.

From this it is clear that a TV system which transmitted a mixture of detail would be useless; it must transmit all the details in a scene separately, yet almost simultaneously, and reassemble them at such a speed that the eye cannot observe the building-up process.

A means of doing this was provided by Nipkow in 1884, when he invented his famous scanning disc, and later Weiller invented the mirror drum for the same purpose. Such mechanical devices as these held the field for many years and in 1923 Baird in this country and Jenkins in America were both using them for the experiments which, in 1925, led to the successful transmission of shadows and simple outlines. It was not until 1926, however, that the first practical demonstration of television took place when Baird transmitted by radio moving pictures of living human faces over a short distance.

The BBC began televised broadcasts in 1930; the ITA in 1955. The first television exchange across the Atlantic was made in 1962 by way of the *Telstar* satellite.

A major development underway in the 1990s was the advent of digital television. For the past 75 years, television broadcasting had used the same analogue technology. Over the next few years the move to digital systems was to dramatically increase the number of channels available for broadcast. In 1996 the British government legislated to allow licensing for six groups of digital channels, or multiplexes. The BBC, for example, was granted its own multiplex and a financing deal designed to help with the transition to digital formats. Now, advances in technology allow not only vastly more audio and visual services, but also a degree of interaction; the use of a television can blur with that of a telephone or a computer. For the time being, both industry and consumers face a bewildering array of unstandardised technologies.

In 1998 the BBC began transmissions of BBC1 and BBC2 in digital widescreen format and BSkyB began a 200-channel digital service.

BBC Choice was BBC's first new general television channel for 34 years. In September 2001, the Government approved eight BBC digital services (including BBC4, two TV channels for children and five digital radio stations). The collapse of ITV Digital in 2002 led eventually to the launch of BBC Freeview. The new BBC3 digital service (aimed at 18–35 year olds) was launched in 2003.

TV manufacturers are now competing for the heavy demand for liquid crystal (LCD) televisions. In 2005 the government confirmed that the UK would switch to digital TV by 2012. Border began the initial switchover in 2007 and the last analogue signals ended in the UK on 24 October 2012.

High definition (HD)TV is the biggest change in TV picture quality in decades, with up to 4 times more picture detail than previously. The next big step forward is ultra high-definition television (UHDTV).

Television Licence. The cost of a current colour TV licence rose from £145·50 to £147·00 from April 2017. Free TV licences for all those aged 75 or over (or households with someone of this age) were introduced from October 2000. If you are 74 (and will turn 75 during your next licensed year) you qualify for a reduced fee Short Term Licence. From September 2016 those without a TV who watch BBC iPlayer on a tablet or phone must pay the full licence.

Tellurium, a relatively scarce element, no. 52, symbol Te, discovered in 1782 by von Reichenstein. Chemically it behaves rather like sulphur; its salts are known as tellurides. It occurs chiefly combined with metals in ores of gold, silver, copper and lead. It is a semiconductor, and some of its compounds (also semiconductors) are used in technical devices.

Telomerase. Structures on the tips of chromosomes which slowly get shorter with age.

Temperature. *See* **T58.**

Templars were soldier knights organised in the 12th century for the purpose of protecting pilgrims in their journeyings to and from Jerusalem, and obtained their name from having had granted to them by Baldwin II a temple for their accommodation. At first they were non-military, and wore neither crests nor helmets, but a long wide mantle and a red cross on the left shoulder. They were established in England about 1180. Important in the Crusades.

In the 12th century they founded numerous religious houses in various parts of Europe and became possessed of considerable wealth. It was this that caused their downfall. Kings and Popes alike grew jealous of their influence, and they were subjected to much persecution, and Pope Clement V abolished the Order in 1312. Edward II in 1308 seized all the property of the English Templars. The English possessions of the Order were transferred to the Hospitallers of St. John, afterwards called the Knights of Malta. *See also* **Hospitallers, Knights, Teutonic Order.**

Temple. Of the temples built by the ancient Greeks, Olympia, Athens and Delphi were the most famous. The Temple of Diana at Ephesus was another. The Temple of Solomon at Jerusalem was destroyed and rebuilt several times; Herod's Temple was destroyed by the Romans in A.D. 70.

Temple Bar, an historic gateway (designed by Sir Christopher Wren in 1672) that until 1877 stood at the junction of the Strand and Fleet Street, London, dividing the City from Westminster.

It was re-erected at the entrance to Theobald's Park, near Cheshunt, Herts., in 1888.

Terbium, an element, no. 65, symbol Tb, discovered in 1842 by Mosander and a rare-earth metal.

Teredo, the scientific name of the ship-worm, a peculiar bivalve mollusc, which lodges itself when young on the bottoms of wooden ships and bores its way inwards, causing much damage.

Termites, also known as *White Ants,* though they are not related to the true ants and are placed in an entirely different insect order (*Isoptera*). They abound in the tropics and also occur in temperate countries, though only two species are common in Europe. There is no British species. They live in colonies and their nests take the form of mounds of earth and wood, cemented together with saliva, and up to 6 m in height. Five separate castes are recognised, three of them being capable of reproduction, and the other two are sterile.

Tern. This slender, gull-like bird has long pointed wings, a deeply-forked tail, pale grey and white plumage, black cap, and is a very graceful flier. There are several species. The Arctic tern winters in the Antarctic, returning to find a nesting place in the spring. It holds the record for long-distance migration, flying from the Farne Islands off Northumberland to the Antarctic and back.

Terracotta Army, the thousands of life-sized figures in fired clay of soldiers who were to guard China's Emperor Qiu Shihuangdi after his death in the 3rd century B.C. Discovered at Xian in 1974. So far 8,000 figures have been unearthed. The Xian site covers an area of 56 square miles, with new discoveries continuing to be made.

Terrapin, a kind of fresh-water tortoise. Native to tropical areas of Asia and Central America. Popular as pets, in the wild they prey on frogspawn, dragonfly larvae *etc.*

Tertiary Rocks, in geology the rocks formed during the Caenozoic era comprising the Eocene, Oligocene, Miocene and Pliocene periods.

Teutonic Order, of German military knights, was founded in the Holy Land at the end of the 12th century for succouring the wounded of the Crusader army before Acre. They were dispersed in the 15th century, but the Order continued to exist until 1809, when Napoleon I confiscated its properties. In 1840 the order was resuscitated in Austria as a semi-religious knighthood. *See also* **Hospitallers, Knights, Templars.**

Textured Vegetable Protein, often referred to as TVP, is an edible protein material given a fibrous texture in the course of its manufacture from agricultural products. Nutritionally the material resembles meat and the extent to which it also resembles meat in succulence, flavour, *etc.* depends on the sophistication of the manufacturing technique and on the skill of the cook.

The common starting material is the soya bean which is rich in protein and oil. The latter is removed, also for use in the food industry, and the residue is further processed to concentrate the protein and to remove unwanted flavours.

A paste of suitable consistency is then forced under pressure through small holes and solidified as fibres. Bound together with a suitable binder and appropriately flavoured, these fibres form a lump of protein substance like meat.

Thallium, a blue-grey metallic element, no. 81, symbol Tl, discovered by Crookes in 1861. It is obtained from the flue dust resulting from the burning of pyrites for making sulphuric acid.

Thanksgiving Day, a national holiday in the United States, observed on the fourth Thursday in November: instituted in 1621 to celebrate the occasion of their first successful harvest.

Theia. The name given to the massive Mars-sized object which is believed to have collided with Earth, giving birth to our moon.

Theodolite. The instrument used by surveyors for measuring angles in the horizontal and vertical planes; also used in meteorology for following balloons to measure windspeed *etc.*

Therm. The charges for gas for lighting and heating (formerly reckoned at per cubic foot) are now based on the calorific, or heat, value of the gas, and the unit used is termed a therm. The therm is 100,000 British thermal units.

Thermionic Emission is the departure of charged particles from matter under the influence of heat. The higher the temperature the greater the flow of escaping particles. The most common example is the emission of electrons from red-hot electrodes—this is the basic phenomenon made use of in thermionic valves (*see* **Valve**). If the hot electrode (the cathode) is enclosed in an evacuated or gas-filled bulb, the emitted electrons can be collected at another electrode (the anode) and will flow through an external circuit back to the emitter. Thus an electric current has been generated by heat.

Thermodynamics, a term first applied by Joule to designate that branch of physical science which treats of the relations of heat to work. What is called the first law of thermodynamics is thus stated by Clerk Maxwell: "When work is transformed into heat, or heat into work, the quantity of work is mechanically equivalent to the quantity of heat." In one of its many formulations, the second law asserts that "the heat tends to flow from a body of hotter temperature to one that is colder, and will not naturally flow in any other way" *See* **Heat.**

Thermo-electric Devices. If two wires of different materials are formed into a loop and if the two joins are kept at different temperatures a current flows in the loop. This was discovered by Seebeck in 1822, and the device is called a thermocouple. The electric current could in principle be made to drive some useful machine, and the energy comes from the heat that is absorbed by the thermocouple—if one part of the thermocouple is not hotter than the others it will not work. It has long been realised that this is a device that converts heat directly into electricity without raising steam and driving dynamos as in a power-station. However, until recently nobody has used thermocouples for much besides temperature measurement, for which they are exceedingly useful. The new development is the manufacture of semiconductors (*q.v.*); for the thermo-electric effects of these new materials are much greater than those of metals. A material much studied in this connection is a compound of bismuth and tellurium, bismuth telluride. It is now practicable to generate useful electricity from suitably designed thermocouples. For example, Russia produces a thermo-electric device which uses the heat from the chimney of a domestic oil-lamp to produce enough electricity to work a radio. Presumably this is very useful in remote parts with no electricity supply. However, the possibilities do not stop there. Indeed, thermocouples can produce electricity direct from the warmth of sunlight on a scale and at a cost comparable with older fuel-burning power-stations.

Thermometer, an instrument by which the temperature of bodies is ascertained. The most familiar kind of thermometer consists of a glass tube with a very small bore, containing, in general, mercury or alcohol. This expands or contracts with variation in the temperature, and the length of the thread of mercury or alcohol gives the temperature reading on a scale graduated in degrees. *See also* end **Section T58–60.**

Thermonuclear Reactions. *See* **Nuclear Fusion.**

Thirty-nine Articles. *See* **Articles.**

Thistle, Order of. *See* **Knighthood.**

Thorium, a scarce, silvery white, metal element, no. 90, symbol Th, discovered by Berzelius in 1828. All substances containing thorium are radioactive. Chief source of thorium is monazite sand, big deposits of which occur in Travancore (India), Brazil and the USA. Important as a potential source of atomic energy since the discovery that it can be transmuted into U^{233}, which is capable of fission like U^{235}. Named after the Norse God Thor.

Thrush, a large family of song-birds of the *Passeriform* order, distributed all over the world. The British species include the robin, redstart, nightingale, song-thrush (or mavis), blackbird, mistle-thrush and ring-ouzel of the mountains. Large numbers of migrant fieldfares and redwings from northern Europe are winter visitors.

Thunder, the sound heard after the occurrence of a lightning flash. It is due to vibrations of the air along the path of the flash, which are set up by the sudden heating (and expansion) followed by the rapid cooling (and contraction) to which the air is subjected.

It is unusual for thunder to be heard more than 16 km away, the distance being estimated roughly by allowing 1 km for every 3 seconds which elapse between seeing the flash and hearing the thunder. Continued rolling of thunder results from the zig-zag nature of the flash and the multiple strokes of which it is composed, variations in the energy developed along the path, and echo effects. Thunder-storms are caused by powerful rising currents of air within towering cumulonimbus clouds. New evidence suggests thunderstorms can trigger asthma attacks. *Thundersnow* is the spectacle of thunder and lightning erupting during heavy snowfall.

Thursday, the 5th day of the week, named after Thor, the Scandinavian deity. To the Romans Thursday was *dies Jovis*, or Jupiter's day.

Tidal Power. The principle of exploiting the energy of the tides is similar to hydro-power since it involves the harnessing of falling water. A barrage across a bay or estuary is filled during flow tide and closed during ebb tide creating a difference in level. When the water is allowed to fall towards the lower side of the barrage it operates a turbine which drives a generator. *See also* **Hydroelectric Schemes.**

Tides, the periodical rise and fall of the waters of the ocean and its arms, are due to the gravitational effect of the moon and sun. Newton was the first to give a general explanation of the phenomenon of the tides. He supposed the ocean to cover the whole earth and to assume at each instant a figure of equilibrium, under the combined gravitational influence of earth, sun and moon, thus making and controlling the tides. At most places there are two tides a day, and the times of high- and low-water vary according to the positions of the sun and moon relative to the earth.

When earth, moon and sun are in line (at full moon and new moon) the gravitational pull is greatest and we get "spring" tides. When sun and moon are at right angles (first and third quarters of the moon's phases) we get smaller "neap" tides.

Tiger, a powerful carnivorous animal of the cat family, which occurs in India and certain other parts of Asia. Its skin is of a tawny yellow, relieved by black stripings of great beauty of formation. Some tigers attain a length of from 3 to 3·6 m. There are now only an estimated 3,900 adult tigers in the wild, whereas in 1900 there were 40,000 tigers in India alone. The tiger is proving remarkably resilient but fears that it will face extinction still remain, particularly in India. Only in 13 countries do tigers still roam free. Tigers are still kept in captivity to perform or for medicinal purposes. The Siberian tiger is the world's largest cat. The tiger was listed as an endangered species in 1972. The only remaining island tiger is the Sumatran. (*c.* 500 remain).

Time. The measurement of time has become of increasing importance to man with the advance of civilisation. It was at first almost inevitably based on the succession of night and day, the waxing and the waning of the moon, and on the changing seasons of the year, and the astronomical observation of these three periodic effects has served as the basis of time measurement until recent years. The precision of the observations has continually increased, and clocks have been developed for dividing the day into smaller units. The clocks were adjusted so as to keep in step with the rotation of the earth on its axis, but now an atomic standard of time has been developed. *See* **Clock, Greenwich Mean Time, British Standard Time.**

Tin is a white, metal element, no. 50, symbol Sn (Latin *Stannum*), whose commonest ore is cassiterite (tin oxide), which occurs in Malaysia, Indonesia, Bolivia, Congo, Nigeria and Cornwall. It protects iron from rusting, and the tin coating on tinplate is applied by dipping the thin steel sheet in molten tin or by electrolysis. Tin alloys of importance include solder, bronze, pewter and Britannia metal. South Crofty, the last tin mine in Europe, was closed in March 1998 (but Hemerdon mine reopened in 2007). The tin mine landscape of Cornwall and West Devon was declared a World Heritage Site in 2006.

Tincal. *See* **Borax.**

Tit *or* **Titmouse,** a small insectivorous bird of the woodlands and forests, bright of plumage and very active and agile, often seen hanging upside down searching for food. There are over fifty species, eight of which occur in Britain: the Great and Blue Tits, the Cole Tit, Marsh Tit, Willow Tit, Bearded Tit, Long-tailed or "Bottle" Tit and the Scottish Crested Tit. The Willow Tit is in serious decline in Britain.

Titan, the largest moon of Saturn (*q.v.*). It is the only moon in the solar system with a thick atmosphere. The Cassini Mission beamed back the first images of Titan in 2004. Its Huygens probe confirmed that Titan contains water and vital organic chemicals and its dark equatorial regions have deserts, lakes and rivers. Vast lakes of liquid methane have been discovered on the surface and scientists are eager to explore these further. Its surface temperature drops to −183°C. Titan is the second largest moon in the solar system. Its largest sea is named Kraken Mare.

Titanium, a scarce metallic element, no. 22, symbol Ti, difficult to extract from ores, found in association with oxygen in rutile, anatase and brookite, as well as with certain magnetic iron ores. It combines with nitrogen at a high temperature. Discovered by the Rev. William Gregor in 1791.

Titanium alloys, being very resistant to stress and corrosion, and combining strength with lightness, find wide application. They are popular as wedding rings. Titanium dioxide is now used in making paints.

Titanosaur. The name of the largest dinosaur yet found. Found by an Argentinian shepherd in 2014. It lived more than 100 million years ago and weighed 70 tonnes.

Tithes, an ecclesiastical tax consisting of a tenth part of the annual produce. After the Tithes' Commutation Act of 1836, tithes were gradually converted into rent charges.

TNT (**Trinitrotoluene**). A high explosive formed by the action of a mixture of nitric and sulphuric acids on toluene. Not highly sensitive to shock, it can be used in shells without danger.

Toad, an amphibian, differing from the frog in having a dry, warty skin, a heavier, squat build and shorter limbs. It has a similar metamorphosis, is largely nocturnal, and will wander far from water after the breeding season. Two toads occur in Britain, the Common Toad and the Natterjack. The latter have a narrow light stripe running down the middle of the back. Numbers in Britain are in dramatic decline. The cane toad is Australia's most notorious pest, having been introduced from Hawaii in 1935. Mild winters have harmed toad numbers in Britain.

Tobacco is made from the leaves of various narcotic plants of the *Nicotiana* family, which contain a volatile oil and an alkaloid called nicotine. Tobacco is grown in countries with a warm climate. It undergoes various processes of preparation. The leaves are first dried, then cut into small pieces, moistened and compressed, and in this form it is known as cut or "shag" tobacco; when moistened with syrup or treacle and pressed into cakes, it is Cavendish; when twisted into string form, it is "twist" or "pig-tail". For cigars the midribs of the dry leaves are removed, and what is left is moistened and rolled into cylindrical shape. For snuff, the tobacco leaves are moistened and allowed to ferment, then dried, powdered and scented.

Smoking in public places was outlawed in Scotland from March 2006 (it is also banned in Ireland, New Zealand, Norway, *etc*). France has banned smoking in cafés and bars and the world's biggest smoking ban is planned for India. Increasingly tough anti-smoking laws are now a global phenomenon.

A wide-ranging ban on smoking in indoor public places was introduced into England in 2007. The minimum age for buying tobacco in England was raised from 16 to 18 in October 2007 (and tobacco now has to be sold "under the counter" in shops). Smoking has been banned in cars where children are passengers from December 2016 in England. Scotland has similar laws.

In 2000, 5,500 *billion* cigarettes were consumed world-wide, compared with 600 billion in 1930. The world's biggest tobacco markets are China, Russia, the USA and Japan. Tobacco today kills more people than narcotics, alcohol, HIV, suicide, homicide and car crashes combined – around 5·7 million annually. Britain now has fewer smokers than any major developed country.

Tolls. Payments for privileges of passage were first exacted in respect of ships passing up rivers, tolls being demanded on the Elbe in 1109. Tolls for land passage are said to have originated in England in 1269, toll-bars being erected at certain distances on the high-roads in the 17th cent., where toll had to be paid for all vehicles passing to and fro. After about 1825 they began to disappear, but still linger on some country roads and bridges. Today, tolls are a feature of motorways and major bridges.

Tonic Sol-Fa, a system of musical notation in which monosyllables are substituted for notes. Thus the major diatonic scale is represented by Doh, Ray, Me, Fah, Soh, La, Te, Doh.

Topaz, a transparent mineral gem, being a silicate and fluoride of aluminium and generally found in granite rocks. Its colour is yellow, but it also occurs in pink and blue shades. The best kinds come from Brazil.

Topiary, the art of clipping and trimming trees, shrubs, *etc.*, into highly ornamental shapes. In Britain this art goes back before Elizabethan times when gardens were formal and the shapes simple and symmetrical. By the end of Queen Anne's reign topiary had become much more elaborate, and all kinds of fanciful shapes were produced. Pliny in his *Letters* tells how box hedges were clipped even in Roman times.

Topology is a branch of mathematics which studies geometrical objects from the point of view of their general shape rather than their precise measurements. For example, from the point of view of topology a ring doughnut and a picture frame have the same shape because they both have one single hole through them.

Topology is used to deduce geometrical facts about an irregularly shaped object such as the Earth from the geometry of a regular object such as a perfect sphere of the same general shape.

Tornado, a violent whirlwind, characterised by a black, funnel-shaped cloud hanging from heavy cumulonimbus and travelling at speeds up to 60 km/h. Tornadoes vary in diameter from less than a metre to a kilometre and occur frequently in the Mid-West region of the USA (known as tornado alley), where it has been estimated that the circling winds of the vortex may reach a velocity of 600 km/h. A severe tornado in Britain struck old Portsmouth and Southsea in 1810. Tornadoes are measured on a scale of 1 to 5. In West Africa the term is applied to thundery squalls. The world's deadliest tornado struck Bangladesh on 26 April 1989.

Tortoises and Turtles, are cold-blooded reptiles, four-footed and encased in a strong shell protection, the shells of some species being of beautifully horny substance and design, once in much demand for combs, spectacle frames and ornamental work. It is the custom to designate the land species as tortoises and the aquatic kinds as turtles. The green turtle, so called because its fat has a green tinge, is sadly in great demand for soup. Together the tortoises and turtles make up the reptilian order called *Chelonia*, the biggest representatives of which are the giant land tortoises of the Galapagos Islands, reaching a weight of 225 kg and living a century. Some of these giant tortoises are said to have lived 200 or 300 years.

The market for food and medicines is driving tortoises and turtles towards extinction. Rising temperatures now threaten male green turtles. The world's smallest tortoise is the South African speckled padloper. Tortoises first appear in the fossil record *c.* 225 million years ago. Turtles can make epic voyages – from Africa to South America. The leatherback turtle has survived for more than 100 million years and probably uses a magnetic or solar compass to navigate.

Toucan, a South and Central American family of brilliantly coloured birds, noted for their huge bills. Toucans live on fruit, are of arboreal habits, and nest in holes. There are *c.* 37 species.

Touchstone, a kind of jasper called by the ancients "Lydian stone", of economic value in testing the quality of metal alloys, especially gold alloys. The testing process is very simple. The alloy is drawn across the broken surface of the Touchstone, and from the nature of the mark or streak it makes the quality of the alloy can be ascertained.

Tourmaline, a mineral occurring in different colours in prismatic crystals. It is a well-known example of a pyro-electric crystal, *i.e.*, one that has a permanent electric polarisation. A double silicate of aluminium and boron.

Tournaments were equestrian contests between military knights and others armed with lances. The Normans introduced them to England.

Trademark, a mark used in relation to goods for the purpose of indicating a connection in the course of trade between the goods and some person having the right, either as a proprietor or registered user, to use the mark. Trade marks can be registered, the registration holding good for 7 years and being renewable thereafter indefinitely for periods of 14 years. Infringement of a registered trademark renders the infringer liable to damages. In 1994, a new law was brought in to harmonise British trademark law with the EU. Owners of registered trademarks will now also be able to have their sign protected in international law.

Trade Winds form part of the circulation of air round the great permanent anticyclones of the tropics and blow inwards from north-east (Northern Hemisphere) and south-east (Southern Hemisphere) towards the equatorial region of low pressure. Atlantic trades are more regular than those of the Pacific. The belts may extend over 2,400 km of latitude and, with the Doldrums, move north and south in sympathy with the seasonal changes in the sun's declination, the average annual range being about 5 degrees of latitude.

Trafalgar Square. The site has often been referred to as the finest in Europe. It was conceived originally as a square by John Nash (1752–1835) when the project was considered of linking Whitehall with Bloomsbury and the British Museum. It was to be named after the new monarch as King William the Fourth's Square but on the suggestion of George Ledwell Taylor (a property owner near the site) alteration to the more popular name Trafalgar Square was agreed to by the King. On the north side the National Gallery was planned by Nash and erected by William Wilkins on the place of the Royal Mews—a work of William Kent a century before. The lay- out was the idea of Charles Barry but he did not approve the erection of the Nelson column.

His idea was for the square to have a grand flight of steps from the north side with sculptural figures of Wellington and Nelson but the Commons decided otherwise and the column as designed by William Railton was begun in 1840. Now the newly-reconstructed Trafalgar Square more closely resembles the original grand Piazza plan.

The two fountains by Barry were supplanted in 1948 by ones designed (1938) by Sir Edwin Lutyens. Executed in Portland stone they are flanked by some bronze sculptures. In the same year memorial busts of Lords Jellicoe and Beatty were placed by the north wall.

The traditional Norwegian Christmas tree has been given by the people of Oslo since 1947.

Transactinides. *See* **T56**.

Transept. The cross aisles of a church, projecting at right angles from the nave or choir.

Transistor. An electronic device consisting of a small piece of semiconducting solid (usually germanium or silicon) to which contact is made at appropriate places by three wires. The three parts resemble in function (not construction or behaviour) the cathode, anode, and grid of a thermionic valve, and transistors can perform many of the operations that valves had originally been used for in radio, television, *etc.* They possess several advantages over valves since there is no need for evacuated glass bulbs nor for a heated emitter to give off electrons. This lead to much greater compactness and economy as well as to a much longer life. Just as the valve was superseded by the transistor, the transistor was replaced with the integrated circuit. The transistor was invented by the Americans Bardeen, Brattain and Shockley in 1948.

T-ray. Terahertz radiation, electromagnetic waves that can pass through objects, sniff out explosives *etc.* On the radiation spectrum they lie between radio waves and infra-red light.

Treasure-Trove, a legal term applying to treasure (coin, bullion, gold or silver articles) found hidden in the earth or other place, for which no owner can be discovered. The treasure legally belongs to the Crown, but it is the practice to return to the finder all articles not required for national museums and to reward him, jointly with the landowner, with the full market value of such as may be retained.

It is the duty of the finder to report to the Coroner for the district in which the find is made. People are obliged to report items more than 300 years old under the 1996 Treasure Act.

Tree Frog, occurs most commonly in America and Australasia. The common European tree frog is a brilliant green animal, the adhesive discs at the tips of its fingers and toes enabling it to cling to trees, *etc.*, with ease.

Tree Rings as Natural Calendar. The approximate relationship between radiocarbon dating (*q.v.*) and true calendar age for the past 7,000 years has been established from measurements on tree-rings. Because one tree-ring is formed annually and its thickness is characteristic of the climatic conditions during its growth, it is possible, by comparing distinctive groups of rings, to date a series of trees. By using the long-lived Bristle Cone pines, tree-rings dating back to 500 B.C. have been obtained. Some corrections and adjustments are needed for very old dates.

These corrections are far less than those proved necessary after the publication of the first radiocarbon dates. Tree-rings (based on the measurement of deuterium in wood) can also show the pattern of temperature fluctuations and thus make it possible to trace climatic changes before written records began. The term for tree-ring dating is *dendrochronology*.

Tree Shrew, an arboreal insectivorous mammal of Asia belonging to the family *Tupaiidae*. Tree shrews are related to the shrews, though in appearance they resemble squirrels except for their sharply pointed snout.

Trees. *See under* **Ash, Elm, Oak** *etc.*

Trent, Council of, the longest and one of the most important in the history of the Roman Catholic Church, was convened to combat the doctrines of Martin Luther. It first sat in 1545, the last sitting being in 1563. At this Council the general policy, principles and dogmas of the Roman Catholic Church were settled.

Triassic *or* **Trias,** the earliest geological period in the Mesozoic era, which began some 225 million years ago. Triassic formations 7,600 m thick occur in the Alps. Modern insects were appearing, and also small reptile-like mammals. Other important Triassic animals were: dinosaurs, ichthyosaurs (marine reptiles), and pterosaurs (flying reptiles). *See* **Section T.**

Tribunes, name assigned to officers of different descriptions in ancient Rome. The original tribunes were the commanders of contingents of cavalry and infantry. The most important tribunes were the tribunes of the plebs, first elected in 494 B.C. as the outcome of the struggle between the patrician and the plebeian orders. They held the power of veto and their persons were sacred.

Trichoptera. This is the insect order comprising the Caddis-flies. These are moth-like insects having hairs on the wings. They are usually found fluttering weakly near water. The larvae are aquatic and are remarkable for the cases (caddis cases) which they build out of sticks, small stones, sand grains, and shells.

Tricolour, the flag of the French Republic since 1789, consisting of three nearly equal vertical bands of blue, white and red (ratio 90 : 99 : 111).

Trident. *See* **Submarine, L103.**

Trilobites, extinct marine arthropods, most abundant in the Cambrian and Ordovician systems. Their appearance may be roughly described as resembling that of a woodlouse, and like that animal the trilobites were capable of rolling their bodies up into a ball.

Trinity House, on Tower Hill, London, was incorporated in 1514 as an association for piloting ships, and has ever since been entrusted with various matters connected with the regulation of British navigation. Since 1854 the lighthouses of the country have been under its supervision. The acting Elder Brethren act as Nautical Assessors in Marine cases which are tried by the High Court of Justice. Under the 1987 Pilotage Act, Trinity House lost its responsibility as the principal pilotage authority to local harbour authorities.

Trireme, an ancient vessel with three rows of oars of great effectuality in early naval warfare. Mentioned by Thucydides. It was a long, narrow vessel propelled by 170 rowers. The Romans copied it from the Greeks.

Tritium, a radioactive isotope of hydrogen which has three times the weight of the ordinary hydrogen atom. It is produced by bombarding an isotope of lithium with neutrons and has a half-life of 12¼ years, decaying with the emission of β-particles (electrons).

Triton, the largest of Neptune's moons, possibly a "captured" dwarf planet.

Tropic-Bird, a long-tailed sea bird, of which there are 3 species (the Red-billed, the White-tailed, and the Red-tailed), frequenting the tropical regions of the Atlantic, Pacific and Indian oceans. They are often called Bo'sun Birds.

Tropics, the term generally refers to the limits of the area of Earth's surface in which the sun can be directly overhead. The Tropic of Cancer is 23° 30′ N, the Tropic of Capricorn 23° 30′ S of the Equator. Climatologists and geographers have less rigid definitions. Global warming is moving the tropics nearer the poles.

Troposphere. The atmospheric layer which extends from the earth's surface to the stratosphere. As a general rule temperature falls as altitude increases. *See* **Atmosphere.**

Troubadours, lyric poets who flourished from the 12th to the end of the 13th cent., chiefly in Provence and the north of Italy. They were often knightly amateurs, and cultivated a lyrical poetry intricate in metre and rhyme and usually of a romantic amatory strain, written in the *langue d'oc*. *See also* **Jongleurs.**

Trouvère *or* **Trouveur,** medieval poet of northern France, whose compositions were of a more elaborate character—epics, romances, fables, and chansons de geste—than those of the troubadour of the south. The poetry was written in the *langue d'oïl*. Flourished *c.* 12th–13th cent.

Truffles are subterranean edible fungi much esteemed for seasoning purposes. There are many species, and they are found in considerable quantities in France and Italy, less commonly in Britain, because of the decline of our ancient woodland. They are often met with under beech or oak trees, and prefer calcareous soils, but there are no positive indications on the surface to shew where they are, and they are not to be cultivated. Hogs, and also trained dogs, are used to scent them out. Truffles are called the 'diamonds of the culinary world' in the USA.

Tsetse, an African dipterous fly belonging to the same family as the house-fly. It is a serious economic pest as it transmits the protozoon causing African sleeping sickness when it pierces human skin in order to suck blood.

Tsunami, a seismic sea wave originating from any one of several submarine geological phenomena such as volcanic explosions, landslides or earth movements. Tsunamis are extremely long waves which travel in the open ocean at speeds up to 640 km/h. In deep water their height is only barely perceptible, but on reaching shallow coastal water they may attain heights of up to 30 m and can cause devastation to low-lying areas (as in 2004 around the Indian Ocean). The Pacific Ocean, whose rim is a seismically active area, is particularly susceptible to tsunamis. Tsunamis are often incorrectly referred to as tidal waves.

The devastation and loss of life caused by the 26 December 2004 Indian Ocean tsunami was without equal in modern times (*c.* 230,000 died). A further devastating tsunami hit Japan in 2011.

Tuatara or **Sphenodon,** a reptile of great antiquity, the sole surviving species of the *Rhynchocephalia*, found in New Zealand. It has a rudimentary third eye on the top of the head; this is called the pineal eye and corresponds to tissue which in mammals forms the pineal gland.

Tube Foot, the characteristic organ of locomotion of starfishes and kindred animals. They are arranged in pairs along the underside of the arms, and their sucker-like ends can grip a surface very tightly. The action of the suckers depends on hydraulic pressure.

Tuesday, the third day of the week, named from the Saxon deity Tuisto, Tiw or Tuesco. To the Romans it was the day of Mars.

Tuileries, a French royal and imperial palace dating from 1564. It was attacked by insurgents in 1792, 1830 and 1848, and was burned down during the Commune of Paris in 1871.

Tumulus, a mound of earth raised over the bodies of the dead. The mound of Marathon, enclosing the bodies of the Athenians who were killed in the famous battle with the Persians, is a celebrated tumulus. Such mounds were commonly raised over the tombs of the distinguished dead in ancient times, and sometimes enclosed heavy structures of masonry. The Roman "barrows" were tumuli. Evidence of such mounds are frequent in prehistoric remains.

Tuna *or* **Tunny,** a large marine fish belonging to the mackerel family, frequenting the warm waters of the Atlantic, Pacific and Mediterranean. Tuna fisheries are a major industry. The Japanese appetite for raw tuna (served as *sushi*) is leading to the extinction of the southern bluefin tuna.

Tundra, the vast treeless plains lying in northern N. America and northern Russia where long severe winters and permanently frozen subsoils (permafrost) have resulted in specially adapted plant communities. The summer thaw and impervious permafrost cause waterlogging of lowland areas and marsh plants occur on these sites. In summer the ground cover of lichens and mosses with some flowering plants is distinctive. Stunted willows and birches may occur.

Tungsten, a hard, brittle metallic element, no. 74, symbol W (it was formerly called wolfram), silver to grey in colour. Its chief ores are wolframite (iron and manganese tungstate) and scheelite (calcium tungstate). Tungsten is alloyed in steel for the manufacture of cutting tools; also in the non-ferrous alloy stellite. Electric lamp filaments are made from tungsten. Tungsten carbide is one of the hardest substances known and is used for tipping tools.

Tunicates. *See* **Sea Squirts**.

Turbines propelled by steam provide power for the propulsion of many ships, and on land steam turbines became a principal source of power, being used in large central electricity stations, for instance, to convert heat energy into electrical energy. The first gas-turbine ship had its trials in 1947.

Turbot, a large flat fish, highly valued as food. It often attains from 13 to 18 kg in weight. Its flesh is white and firm. It is confined to European waters, and is caught by line or trawl.

Turkey, a fowl of American origin, brought to Europe from America soon after the discovery of that country. It was a domesticated bird in England in the first half of the 16th cent.

Turmeric, spice used to flavour curries which is now believed to have anti-cancer properties.

Turpentine, an oily substance obtained from coniferous trees, mostly pines and firs. It is widely used especially in making paints and varnishes, and also has medicinal properties.

Turquoise, formerly called Turkey-Stone, is a blue or greenish-blue precious stone, the earliest and best specimens of which came from Persia. It is composed of a phosphate of aluminium, with small proportions of copper and iron. India, Tibet, and Silesia yield turquoises, and a variety is found in New Mexico and Nevada. The first specimens were imported through Turkey. Turquoise has been mined since at least 6,000 B.C.

Turtle. *See under* **Tortoises**.

Turtle Dove, a summer visitor from Africa to southern England. It is a small, slender bird with reddish-brown upper parts, pinkish throat, black tail with white edges, and a repeated purring note. Turtle doves are a symbol of love and fertility.

Tweed. A rough-surfaced fabric of the twilled type, usually all-wool, though cheaper kinds may include cotton. Of a soft, open, flexible texture, it may have a check, twill or herring-bone pattern. Harris, Lewis, Bannockburn and Donegal tweeds are well known.

Twelfth Night is properly the eve of the feast of the Epiphany. It was once the most popular festival next to Christmas. Some people wrongly believe Twelfth Night falls at the end of the 12th day after Christmas.

Twilight. There are several different classifications of twilight, each of which is based on the angular distance of the Sun below the observer's horizon. Civil twilight begins or ends when the centre of the solar disc is 6° below the horizon, nautical twilight beginning and ending when the centre is 12° below. The brightest stars are visible during nautical twilight. The third is astronomical twilight, at which time stars of 6th magnitude are visible provided the sky is clear. Astronomical twilight starts and finishes when the centre of the Sun is 18° below the horizon.

Tyburn, a former small tributary of the Thames, which gave its name to the district where Marble Arch and Hyde Park now stand. Here public executions formerly took place.

Tycoon, the title by which the commander-in-chief of the Japanese army (virtually the ruler of Japan) was formerly described by foreigners. (In Japanese *taikun* means great lord or prince.) The term is now applied, usually in a derogatory sense, to an influential business magnate.

Tynwald, the title given to the Parliament of the Isle of Man, which includes the Governor and Council (the Upper House), and the House of Keys, the representative assembly. This practically constitutes Home Rule, the Acts passed by the Tynwald simply requiring the assent of the Sovereign.

Typhoon. *See* **Cyclone.**

U

Ultramarine, a sky-blue pigment obtained from *Lapis lazuli*, a stone found in Tibet, Iran, Siberia and some other countries. A cheaper ultramarine is now produced by grinding and heating a mixture of clay, sulphur, carbonate of soda and resin.

Ultrasonics, sound waves of frequency so high as to be inaudible to humans, *i.e.*, above 15,000 Hz (Hz is SI unit for cycle per sec.). Ultrasonic waves are commonly produced by causing a solid object to vibrate with a suitable high frequency and to impart its vibrations to the air or other fluid. The object may be a quartz or othercrystal in which vibrations are excited electrically, or a nickel component which is magnetically energised. There are numerous technical applications, *e.g.* submarine echo soundings, flaw detection in castings, drilling glass and ceramics, ultrasound investigations in medicine *etc.* Ultrasonic waves are an important tool of research in physics. Bats produce very loud sounds when they are flying, but at ultrasonic frequencies (20,000 to 150,000 Hz)

Ultra-Violet Rays. These are invisible electromagnetic rays whose wavelengths are less than 3900 Å. (Angstrom = one hundred-millionth of a centimetre.) The sun's radiation is rich in ultra-violet light, but much of it never reaches the earth, being absorbed by molecules of atmospheric gases (in particular, ozone) as well as by soot and smoke particles. One beneficial effect of ultra-violet light on human beings is that it brings about synthesis of vitamin-D from certain fatty substances (called sterols) in the skin. The wavelengths which effect this vitamin synthesis also cause sun tan and sun burn. Ultra-violet lamps (which are mercury-vapour discharge lamps) are also used for sterilising the air inside buildings, their rays being lethal to bacteria. Many substances fluoresce under ultra-violet light; for instance, zinc silicate glows green, while cadmium borate throws out red light. This phenomenon is applied in fluorescent lamps, the light of requisite hue being secured by judicious mixture of the fluorescent materials which coat the lamp.

Umbra, the full shadow of the earth or moon during an eclipse. The term is also used to describe the darker, cooler central region of a sunspot.

Unciae. The Romans took over the Egyptian cubit and divided it into 16 digits as well as into 12 parts called *unciae*, the *uncia* being the origin of the inch.

Unicorn, a fabulous single-horned animal. In fact the "Siberian unicorn" lived alongside early humans in Kazakhstan 29,000 years ago. Creatures like this were described by the Greek physician Ctesias *c.* 400 B.C. In heraldry its form is horse-like, with the tail of a lion and pointed single horn growing out of the forehead. In the Middle Ages the unicorn was a symbol of virginity.

Union Jack, the common name for the official 'Union Flag' of the United Kingdom since 1801 (the Union with Ireland). Jack derives from the nautical term for flag. Commissioned by James I in 1606 to represent the union of England and Scotland (updated in 1801 when Ireland was added).

Union of Great Britain and Ireland was proposed in the Irish Parliament in January 1799 after the 1798 Rebellion and came into force on 1 January 1801.

The troubled history of Ireland, associated with the question of self-government, nationalism, land and religion, culminated in the Easter revolution of 1916. A treaty giving the 26 southern counties independence in 1921, as the Irish Free State, was followed by a period of internal dissension. In 1937 a new constitution was enacted in Ireland in which no reference was made to the Crown. This, however, left in force the External Relations Act of 1936 and with its repeal in 1948, Ireland separated itself from the British Crown and thus severed the last constitutional link with the Commonwealth, and became an independent Republic.

Union of Soviet Socialist Republics (**USSR**). The Union of Soviet Socialist Republics was formally constituted on 6 July 1923, covering most of the old Russian Empire overthrown in the Communist revolution of 1917, minus the territories which formed Finland, Poland, the Baltic Republics and East Prussia. With the fall of communism, it collapsed in 1991.

Universal Credit. A new single payment for those unemployed or on low incomes, replacing tax credit, housing benefit, JSA, income support *etc*. Pilot schemes are now being introduced, but have encountered problems.

Universe, *See* **Section T, Part I.**

Universities are institutions of higher education whose principal objects are the increase of knowledge over a wide field through original thought and research and the teaching of students. Such societies existed in ancient Greece and India, but the origin of the University as we know it today lies in medieval Europe.

The first bodies to become recognised under this description were at Bologna and Paris in the first half of the 12th cent.; Oxford was founded by an early migration of scholars from Paris, and Cambridge began with a migration from Oxford.

Other Universities began to emerge all over Europe, including three in Scotland—St. Andrews (1411), Glasgow (1451) and Aberdeen (1494)—which were followed by Edinburgh in 1582. These six bodies remained the only Universities in Great Britain until the foundation in 1826–29 of University and King's Colleges in London (resulting in the establishment of the University of London in 1836) and of the University of Durham in 1832.

The 35 old-established universities in England were: Aston, Bath, Birmingham, Bradford, Bristol, Brunel, Buckingham, Cambridge, The City, Durham, East Anglia, Essex, Exeter, Hull, Keele, Kent, Lancaster, Leeds, Leicester, Liverpool, London, Loughborough, Manchester, Newcastle, Nottingham, Open, Oxford, Reading, Salford, Sheffield, Southampton, Surrey, Sussex, Warwick and York. Other old institutions of university standard were the University of Manchester Institute of Science and Technology; the Manchester Business School; the London Graduate School of Business Studies; Cranfield Institute of Technology; and the Royal College of Art.

Wales used to have one University (The University of Wales with colleges at Aberystwyth, Bangor, Cardiff and Swansea) in addition to the Welsh National School of Medicine, the Institute of Science and T7echnology, and St. David's, Lampeter. Scotland had eight: Aberdeen, Dundee (1967), Edinburgh, Glasgow, Heriot-Watt (1966), St. Andrews, Stirling (1967), and Strathclyde (1964), Britain's first technological University. Northern Ireland has two: Queen's University, Belfast and the New University of Ulster at Coleraine.

The Open University (OU) received its charter in 1969; it provides degrees and other courses and began its broadcasts in January 1971. More students register with the OU each year than with any other English university.

The Republic of Ireland has the University of Dublin (Trinity College, Dublin), the National University of Ireland, Dublin City University and the University of Limerick among its most famous seats of learning.

In the United States the best known are Harvard (1636), Yale (1701), Princeton (1746), Columbia (1754), Cornell (1865), California (Berkeley), Massachusetts Institute of Technology. In 1972 the European University Institute was established with headquarters in Florence.

In Britain, many universities receive aid from the State in the form of grants from the Higher Education Funding Council which oversees the distribution of state finance. But they are selfgoverning institutions free from State control. In 1992, the distinction between the former polytechnics and the older universities ended. In 2013 a new generation of University Technical Colleges was inaugurated (*e.g.* at Greenwich). The University of the Creative Arts dates from 2008. The College of Law is now the University of Law, having the largest law school in the country.

The ending of free tuition for students (from September 1998) and the other implications of the 1997 Dearing Report, heralded a revolution in higher education. The debate on "top-up" fees has aroused much passion. In addition, new two-year 'foundation degrees' were planned which began in September 2001. Some smaller colleges and specialist institutions became universities after changes announced in 2012. (e.g. Harper Adams University in Shropshire). Some prominent private for profit universities are the University of Law and BPP University College of Professional Studies.

A very different type of organisation is the University of the Third Age (U3A), which is essentially a collective of older people who meet to participate in an exchange of information and ideas. Since its arrival in the UK in 1981, it has grown enormously. Now it has 985 study groups with nearly 400,000 persons enrolled. Its website is www.u3a.org.uk.

See also entries for **Cambridge University, Oxford University** and **London University**.

Unknown Warrior, the tomb of the Unknown Warrior is in Westminster Abbey. In the United States, it is in Arlington National Cemetery. Such tombs serve as a memorial to all the war dead.

Uraninite. *See* **Pitchblende**.

Uranium, a metallic element, no. 92, symbol U, discovered by Klaproth in 1789 in pitchblende. It is a white metal which tarnishes readily in air. Great developments have followed the discovery that the nucleus of the uranium isotope U^{235} undergoes fission, and uranium minerals have become very important since it was found that atomic energy could be released controllably by taking advantage of fission. Before atomic energy work began to take the major part of the world's output of uranium minerals, the chief users of uranium compounds were the ceramics and textile industries. Britain imports its uranium from Australia and Canada. *See* **Nuclear Reactors, Nuclear Fission**.

Uranus. This planet was discovered by Herschel in March 1781. Its diameter is 51,118 km and its mean distance from the Sun is $2{,}871 \times 10^6$ km. When Voyager 2 visited Uranus in January 1986, it raised the number of known moons orbiting the planet from five to 15 (this total has now grown to 27). Puck is the largest inner moon. The number of known rings surrounding Uranus was also increased to 11. Uranus has a large axial tilt which means that it rotates on its side. Each pole faces the Sun every half-revolution around the Sun, *i.e.* every 42 years. The dark rings of Uranus have now been seen end-on for the first time. *See* **Section T, Part I and Voyager.**

Urea, the final product in mammals of the breakdown of nitrogenous waste, *e.g.*, excess amino-acids. It is very soluble in water and is excreted in urine. In 1828 Wohler synthesised urea from inorganic matter. This was the first laboratory synthesis of an organic substance and refuted the idea that living creatures or life force are needed to create such substances.

Ursa Major and **Ursa Minor** ("Greater Bear" and "Lesser Bear"), two celebrated constellations, each of seven stars, in the northern celestial hemisphere, familiar since ancient times. Ursa Major has also been called "the Plough", "Charles's (Charlemagne's) Wain" or "the Wagon". The "Pointers" in this group of bright stars point to the brightest star in Ursa Minor, the Pole Star. Called the Big Dipper and the Little Dipper in the USA.

V

Valency. A term used by chemists to describe the combining ability of an element with respect to hydrogen. Thus oxygen, which forms water, H_2O, with hydrogen is said to have a valency of two, nitrogen (forms ammonia, NH_3) three, and carbon (forms methane, CH_4) four. Chlorine forms hydrogen chloride, HCl, and is said to be monovalent. This empirical approach cannot account for valency in such compounds as carbon monoxide, CO, which appears to require both elements to have the same valency.

With the discovery of the electron it was realised that the concept of valency and chemical bonds is intimately concerned with the electronic structure of atoms, and theories have been advanced to explain why the same element can have different valencies in different compounds. Iron, for example, can have a valency of two ($FeCl_2$, ferrous chloride) or three ($FeCl_3$, ferric chloride). *See* **Section T, Part II** and **Table of Elements** (**T56**).

Valentine's Day (14 February), is a festival in celebration of St. Valentine, one of the Christian martyrs of the 3rd cent. A sweetheart or Valentine is chosen on that day and letters or cards sent secretly to the loved one. The first printed Valentine cards in England date from the late 18th century.

Valkyries, *See* **I33.**

Valve, an electronic device consisting of two or more metal plates (electrodes) usually enclosed in an evacuated glass bulb. One of the electrodes is heated causing electrons to be emitted. If a positive voltage is applied to the other electrode, the electrons will move towards it and the valve must conduct electricity. The current will only flow in one direction as the electrons are emitted only from one direction. A valve with two electrodes is called a diode, but by putting in one or more intermediate electrodes the flow of current can be sensitively controlled and the valves are then called triodes, pentodes, *etc.*, according to the total number of electrodes in them.

Valves originally found extensive applications in amplifiers, rectifiers, oscillators and many electronic devices, but have now been superseded by transistors, which in turn have been replaced by the integrated circuit and the micro-chip.

Vanadium, a scarce metallic element, no. 23, symbol V, whose chief ores are carnotite and patronite. Some iron ores contain it. Most of the vanadium commercially produced finds its way into vanadium steels, which are used for tools and parts of vehicles, being hard, tough and very resistant to shocks. The oxide is used as a catalyst in industry, especially in making sulphuric aicd. Named after the old Norse name for the Scandinavian goddess Freyja.

Van Allen Belts. One of the most remarkable discoveries of the International Geophysical Year (1957 58), was that the earth is surrounded by a great belt of radiation.

Evidence came from *Sputnik II* (which carried the dog Laika) and from the American satellites, *Explorers I* and *III*. The American scientist, J. A. van Allen, was able to explain the puzzling data collected from these satellites. Subsequent observations with deep space-probes showed that there are in fact two zones of high intensity particle radiation surrounding the earth, one concentrated at a distance of about 1,600 km, the other at about 24,000 km. A close relation exists between the shapes of the zones and the earth's magnetic field. Jupiter is surrounded by a dense belt of trapped high-energy particles.

Vatican, the Papal residence at Rome, a famous palace on the hill adjacent to St. Peter's. Works of Michelangelo glorify the Sistine Chapel.

Vauxhall Gardens, a famous London pleasure resort from the early part of the 18th to the middle of the 19th cent. It was here that many great singers appeared and where the earliest balloon ascents were made.

Venus, the brightest of all the planets, whose orbit lies between the orbits of Mercury and Earth. It is second in order from the sun (*q.v.*). It approaches the earth to within 40 million km. It moves around the sun in the same direction as Earth and the other planets but rotates in the opposite sense. It has been visited by a number of American and Russian probes, some flybys, some soft-landings, others atmospheric probes.

It has 90 times the atmospheric pressure of the earth and temperatures of 450°C. It is covered in a very thick cloud mainly of carbon dioxide which some scientists believe acts like a greenhouse trapping the heat from the sun. Complex reactions occur in the atmosphere and the rain consists mainly of sulphuric and hydrochloric acid. The cloud rotates about six times faster than Venus rotates and swirls into the polar regions like giant whirlpools.

The *Venus Express*, which went into orbit in 2006, was flawlessly collecting vital information about the hot, turbulent atmosphere of the planet until 2015. The atmosphere is now known to be very fickle, changing its structure daily. *Venus Express* revealed images of 225mph winds bearing across the planet (the superrotation of Venus).

Much information has come from both the Pioneer Venus orbiter and the Magellan probe, which between them have mapped nearly the entire Venusian surface. There are two major continents, Aphrodite Terra, is about the size of Africa, and the smaller Ishtar Terra, about the size of Australia, which consists of a very high plateau (*c.* 3,300 m) and a mountain range dominated by Maxwell Montes (at 10,600 m higher than Everest). Aphrodite Terra has a deep trench 2,900 m below "sea level". Most of the planet (60 per cent) is relatively flat. There are no moons.

The Magellan probe (1990) revealed a carbon dioxide atmosphere, 100 times thicker than Earth's, with sulphur escaped from volcanoes as well as the longest channel (4,200 miles) in the solar system. It found that there are no asteroid impact craters bigger than 5 miles across.

Venus has an ozone layer hundreds of times less dense than Earth's and there is tantalising evidence of active valcanoes.

Venus Fly-trap, a well-known insectivorous plant (*Dionaea muscipula*) occurring in Carolina in damp mossy places. It is related to the Sundew. The leaf is the organ that catches the insects. The leaf blade is in two halves, hinged along the centre line. Each half bears three sensitive hairs called "trigger hairs". When an insect touches a trigger, the two halves of the leaf clap together, trapping the insect between them, when it is digested by a secretion (digestive enzymes) from the leaf.

Vernalization. Seeds which, after being exposed to a low temperature, produce plants that flower earlier than usual are said to have been "vernalized". This technique of seed treatment devised by Lysenko is called vernalization.

Vesta, second largest object in the asteroid belt (523 km in diameter). It has more in common with a planet than an asteroid. The Dawn probe visits it in 2015. Also a Roman goddess (*See* **I29**).

Victoria and Albert Museum, in Kensington, London, was begun in 1852 as the Museum of Ornamental Art at Marlborough House. The present building was completed in 1909. It is one of the great museums of the world for the fine arts. The new British Galleries were opened in 2001. A new V&A East is planned for 2021.

The V&A now also administers Ham House (Richmond) and Osterley Park House. The Museum of Childhood (Bethnal Green) is a branch of the V&A. Its enchanting exhibits include *c.* 8,000 dolls. Apsley House (home of the 1st Duke of Wellington) is also part of the V&A. For further details, *see* www.vam.ac.uk.

Victoria Cross, an order of merit for conspicuous valour, awarded to members of the Army, Navy and Air Force. The first investiture was in June 1857. The VC has been awarded only 1,354 times (the two youngest VCs were aged only 15).

Videotape Recording (**VTR**), technique for recording television programmes on to magnetic tape. The original means of storing programmes for broadcast or library purposes was by filming productions from high-quality monitors, an expensive and slow process, since the film had to be chemically developed and edited in the conventional way. The difficulty in establishing an instant play-back system along the lines of the sound tape recording system lay in the high speed and large amount of tape needed to accommodate the picture signal. The BBC experimented with a machine called VERA, but it was an American machine, the Ampex VR100, which provided the breakthrough. This recorded the picture across a wider tape rather than along it, and moving at a slower speed. The modern domestic recorder is usually of the VHS standard, while broadcasters use the higher quality systems, such as Betacam. DVDs have now replaced the older VCRs (the last was produced in 2016). The new generation of high-definition DVDs store up to six times as much data on disc.

Vikings. Scandinavian warriors who from the 8th to the 10th cent. were the terror of northern waters. Sometimes the Viking raids reached south to the Mediterranean and east to the White Sea. Their leader Rurik founded the first Russian kingdom of Novgorod in A.D. 862. The Icelandic Vikings under Eric the Red discovered Greenland in A.D. 982 and a warm period in world climate allowed many to settle there. Their expeditions took them to Labrador and Newfoundland (which they named Vinland). The final extent of their settlement remains disputed). They excelled in shipbuilding, were fine sailors and craftsmen. They were also traders with cities as far away as Constantinople. They established Dublin as a major slaving centre. The name may derive from *vik*, a sheltered deep-water bay now called a *fjord*. The first Viking raid on England was at Lindisfarne in 789 A.D.

The old belief that Vikings floated their dead leaders out to sea in burning boats is a myth.

It is now believed many Viking women accompanied their menfolk in their longboats. Apart from Orkney, there is little genetic signature in Britain from the Vikings.

Village Green. *See* **Commons.**

Vinyl Plastics are polymers made from derivatives of ethylene, examples are polyvinyl chloride (PVC), which is used in making plastic pipes and kitchen utensils, among other things; polyvinyl acetate used in the paint industry and in bonding laminated articles like plywood; and polystyrene (polyvinyl benzene) used in making electrical fittings and for lenses.

Viper, a family of poisonous snakes in which the venom-conducting fangs hinge forward when the snake bites. One species is found in Britain, the common viper or adder.

Visibility is defined by the distance at which the farthest of a series of objects, specially selected to show against the skyline or in good contrast with their background, can be distinguished. Visibility depends chiefly upon the concentration of water or dust particles suspended in the air. Instruments are available to measure the obscurity of the atmosphere more directly, including that at night. A large lapse rate of temperature and a strong wind are favourable to good visibility; a small lapse rate, calm or light wind favourable to bad visibility. Fog is when the visibility is less than 1,000 m; mist or haze when it is between 1,000 and 2,000 m. *See* **Pollution.**

Viscount, a title of rank coming between that of Earl and Baron. The title originally stood for deputy-earl. The first English Viscount was Viscount Beaumont, created in 1440.

Vitamins, name of a group of organic substances found in relatively minute amounts in certain foodstuffs, essential for growth and the maintenance of normal bodily function. *See* **Z40**.

Volcanoes are vents through which magma reaches the surface as lava flows, or as the solid products, *e.g.*, ashes and bombs, of explosive eruption. The vent may be cylindrical or it may be a long fissure.

The former type usually builds up cones, *e.g.*, Vesuvius. Notable active volcanoes are Etna, Vesuvius and Stromboli, in Italy (known as the lighthouse of the Mediterranean). Soufrière on Montserrat; and Mont Pelée on Martinique. The last-named was in violent eruption in 1902, when the chief town of St. Pierre was destroyed. The world's most active volcano is Kilauea on Hawaii. Europe's most active volcano is Mt. Etna. The highest volcano in the world is Kilimanjaro, in Africa.

Volcanic eruptions are sometimes linked with brilliant sunset phenomena, *e.g.*, the Indonesian island of Krakatoa (1883), whose atmospheric and tidal effects were recorded all over the world, and Agung on the island of Bali (1963), which had been dormant for 120 years. In 1991, the eruption of Mt Pinatubo in the Philippines killed 300 people, while in 1997 Montserrat was threatened by the Soufrière eruption.

The famous eruption at Vesuvius took place on 24 August 79 A.D. whilst the huge eruption on the Greek island of Santorini occurred in *c.* 1450 B.C.

The huge eruption at Tambora (Indonesia) in 1815 killed an estimated 90,000 people. The ash clouds which followed the Eyjafjallajökull volcanic eruption in April 2010 caused massive disruption to air travel. There are towering volcanoes on Mars far higher than any on Earth. Venus has over 50,000 volcanoes. The discovery of volcanoes on Io, a moon of Jupiter, was a major scientific advance.

The deepest undersea volcanoes on Earth were found in 2010, three miles beneath the surface of the Caribbean. The largest volcano yet discovered lies below the Pacific Ocean. Indeed major underwater volcanoes can produce new volcanic islands.

Vole, a small rodent with blunt nose, round face and short tail. Three kinds occur in Britain: the field, the bank and the water vole. The water vole is now our fastest declining mammal, due to loss of habitat and mink predators. It kicks up clouds of mud in water when threatened. Known as a water rat, its numbers have fallen 90% since 1990.

Volt, the electromotive force unit, named after Alessandro Volta (1745–1827), and defined in terms of the coulomb, the second and the joule.

Voyagers 1 and 2. These spacecraft were launched from Earth on 5 Sept. 1977 and 20 Aug. 1977 respectively as a follow-on mission to the earlier and successful Pioneer 10 and 11 spacecraft.

Both probes were launched towards the planets of the outer solar system. Voyager 1 reached Jupiter in 1979 and flew by the moons Callisto, Ganymede, Europa and Io. It was then set on a course for Saturn, examining the rings and the satellite Titan, before heading out of the solar system with no further planetary encounters. Voyager 2 also flew to Jupiter and then to Saturn.

The flyby of Saturn by Voyager 2 in Aug. 1981 was carefully planned to obtain the maximum of new information to complement that obtained from Voyager 1 to help understand some of the perplexing new phenomena, and revealed even more new features of this beautiful and still enigmatic planet. Even after its Saturn flyby, the work of Voyager 2 was far from complete: its swing by Saturn redirected it toward Uranus, on which it provided our first close-up data in Jan. 1986, and from there it continued to Neptune in 1989, taking advantage of a unique arrangement of all four of the outer planets, Jupiter, Saturn, Uranus and Neptune, which only occurs once every 200 years.

Voyager 1, which would not pass particularly close to any planet after Saturn, carries a multilingual goodwill message as well as musical selections to far outside our solar system. It will not reach its nearest star, Sirius, for 360,000 years.

In March 1990, Voyager I beamed back its last colour photographs. By then it was 3,500 million miles from Earth, travelling at 37,000 mph. In 2012 it left the confines of our solar system, to become the most distance human made object.

Voyager 2 has now also headed out of the solar system and gone on to make and transmit observations of the solar heliosphere.

Vraic, a name for seaweed in the Channel Islands, where it is extensively used as a manure.

Vulture, a famous bird of prey of two distinctive groups; that of the Old World, whose nostrils are separated by a bony partition, and the New World vulture, which has no such division. There are 23 species worldwide.

Vultures feed on carrion and are the great scavengers of tropical regions. The European species are the Egyptian vulture, Griffon vulture, Black vulture and Bearded vulture. Vultures have no feathers on the head and neck. Vultures in India and across Africa are in critical decline, killed off by feeding on carcasses of livestock which have been given anti-inflammatory drugs or poisoned by poachers.

W

Wading Birds, *Charadriiformes*, an order of migratory, long-legged, long-billed birds, frequenting marshes and shallow waters. They include the plovers, avocets, stilts, oystercatchers, curlews, godwits, dunlins, sandpipers, redshanks, greenshanks, snipe, woodcocks, the pratincole of the Mediterranean and the sun bittern of tropical America. Many species breed in Britain.

Wagtails, familar long-tailed small birds, the most common British species being the Pied or Water (with sub-species White) Grey and the Yellow (sub-species Blue). Wagtails nest in holes.

Walloons, name given to the French-speaking population of the southern provinces of Belgium, in contrast to the Flemings or Dutch-speaking population of the northern provinces. The Walloon areas contain much heavy industry.

Walpurgis Night, the night before 1 May, when witches were supposed to have liberty to roam. Named after St Walpurgis, an English nun.

Walrus, a very large marine mammal, related to the seals having in the upper jaw two large curved tusks, which average in length from 38 to 60 cm. It lives on bi-valve molluscs, and inhabits the Arctic seas. An adult walrus can exceed 4 m in length and weigh over a tonne. The mammal is now threatened by melting sea ice and there are calls for it to become a protected species.

Wankel Engine *or* **Rotary Engine,** is an internal combustion engine invented by Felix Wankel in the 1930s and greatly developed since. The ordinary internal combustion engine has to convert reciprocating motion of the pistons into rotary motion. In the Wankel engine the explosion of the fuel and air mixture drives a moving part (the rotor) directly into rotatory motion, and the rotor itself opens and closes the fuel inlet and exhaust ports. The three spaces between the triangular rotor and its specially shaped housing act successively as intake, compression, explosion and exhaust chambers as the rotor revolves. There are no valves and far fewer moving parts than in an ordinary piston engine. The Wankel engine is claimed to have many advantages in that it is smaller and lighter for a given horse-power, relatively simple, quieter and freer from vibration, and could contribute to pollution control.

Warblers, a family of small, lively song-birds closely related to the flycatchers and thrushes. Represented in Britain by about 36 species, including the chiffchaff, one of the earliest of our spring visitors, willow-wren, wood-warbler, garden-warbler, whitethroat, sedge and grasshopper-warbler. The blackpoll warbler migrates from Canada to South America, one of the longest overwater flights recorded for a song bird.

Warrigal. *See* **Dingo.**

Wasps. *See* **Hornets.**

Water is the simplest compound of hydrogen and oxygen. It is formed when an electric spark is passed through a mixture of the gases, and is a product of combustion of all hydrogen-containing compounds, *e.g.*, petrol, coal, coal gas and wood.

Water is essential to living matter, and is the medium which carries food to animals and plants. Salts in hard water may be removed by distillation of the water or by a process known as ion-exchange (water softening). Pure water freezes at 0°C and boils at 100°C and is used as a standard of temperature on this scale. It has a maximum density at 4°C. Heating water above 100°C converts it into steam, which is used under pressure to convert heat energy into useful work, as in electrical power stations and steam engines.

Water gas is a mixture mainly of carbon monoxide and hydrogen formed by blowing steam and oxygen through red-hot coke: it is used as a fuel. Water is one of the very few compounds which freezes from the surface down rather than from the bulk of the liquid up. This property has important consequences on the preservation of life in rivers and lakes when they are frozen.

The Drinking Water Inspectorate set up in January 1990 has responsibility for checking that water supplied by the water companies is wholesome and fit to drink when it reaches your home.

The growing pressure for available water world-wide means that water has become the oil of the 21st century. At present 11% of the world's population do not have access to safe drinking water. Around 1,400 children die each day because of dirty water and poor sanitation.

Waterfalls, the world's highest (in ft) are the Angel Falls in Venezuela (3,212), the Tugela Falls in South Africa (3,110) and the Utigord in Norway at 2,625.

Water Hyacinth (*Eichhornia crassipes*), a beautiful aquatic plant native to Brazil which has spread to other favourable equatorial regions of the world causing havoc on account of its abnormal rate of reproduction away from its natural environment. In recent years it has invaded the Nile and the Congo, forming vast floating carpets which block the channels, clog the paddles of river craft and deoxygenate the water, killing the fish. It is being held in check by spraying with herbicides.

Water Rat. *See* **Vole.**

Waterloo Bridge, crossing the Thames, was built by Rennie, and opened in 1817. It had nine arches, each 120 ft (36 m) span, was built of granite, and had a length (with approaches) of 2,456 ft (749 m).

The present bridge, completed in 1942, and formally opened 10 December 1945, is a fine example of reinforced concrete construction. (Architect, Sir Giles Gilbert-Scott.)

Watling Street, the name of the old Roman road which ran from the Channel ports by way of London to Shropshire. *See* **Roman Roads (L94).**

Watt. A unit of electrical power equivalent to 1 joule of work per second, named after James Watt (1736–1819). A kilowatt is 1,000 watts.

Wattle. The national flower of Australia.

Waxbill, a small Oriental and African bird of the *Estrildidae* family, with wax-like bill and beautifully variegated plumage. The Java sparrow, and the Blue-breasted waxbill are attractive, but sadly still find their way into cages.

Weasel. A carnivore mammal found in Britain, smallest member of the group including the Stoat, Polecat, and Pine-marten, about 20 cm long. Its fur is reddish on the upper side of the animal, white on the under side; it may all turn white in winter with the exception of the tail.

Weather is generally accepted as being the current state of the atmosphere, particularly as regards its pressure and temperature, wind, cloud and precipitation. Many other features such as fog, sunshine duration, humidity, pressure tendency, may be added to the list, all items of which are routinely observed by specially instrumented stations usually sponsored by the national meteorological services. Day-to-day changes in the weather as experienced by the individual are due to the passage of circulation systems, many of which bring clearly recognisable areas of "good" (*i.e.*, calm and sunny) weather as frequently occurs in anticyclones and "bad" (*i.e.*, cold, windy, cloudy and rainy) weather.

Clearly, the weather in any place at any time is primarily determined by the frequency and intensity of synoptic-scale weather circulation systems (*c.* 3,000 km across). Local weather (over areas of *c.* 100 km) may be heavily influenced by topography, *e.g.*, valley fogs, frost hollows.

Weather Lore. Before instruments were invented to measure atmospheric conditions, man relied on his own observation of wind and sky, behaviour of birds and animals, and came to associate certain phenomena with types of weather. Many popular weather rhymes have survived the centuries, and as long as forecasting is confined to the next few days there is something to be said for them, particularly those dealing with the winds.

Weaver Bird, the popular name for a large group of finch-like birds belonging to the family *Ploceidae*, found principally in Africa but also in Southern Asia, Australia, and Europe and remarkable for their habit of building nests formed of blades of grass dexterously interwoven and suspended from the boughs of trees.

Weaving. *See* **Section N.**

Wedding Anniversaries are: first, Paper; second, Cotton; third, Leather; fourth, Fruit and Flowers; fifth, Wooden; sixth, Sugar; seventh, Woollen; eighth, Bronze; ninth, Pottery; tenth, Tin; twelfth, Silk and Fine Linen; fifteenth, Crystal; twentieth, China; twenty-fifth, Silver; thirtieth, Pearl; thirty-fifth, Coral; fortieth, Ruby; forty-fifth, Sapphire; fiftieth, Golden; fifty-fifth, Emerald; sixtieth, Diamond; sixty-fifth, Platinum or Blue Sapphire; seventieth, Platinum; seventy-fifth, Diamond or Gold; Oak (for eightieth).

Wednesday, the 4th day of the week, derived its name from Woden or Odin, the Norse god of war.

Weights and Measures. *See* **L2** and **T58–60.**

Welding is a means of joining together two pieces of material, often metals, by heating the joint until the substances melt locally, run together, and then solidify. The heating can be by burning gas (*e.g.*, oxy-acetylene welding) or electric current (electric arc welding). Techniques exist for welding anything from hair-like wires to massive steel plates. *See* **Soldering.**

Werewolf, a man or woman, who according to mediaeval belief, could be turned by witchcraft or magic into a wolf, eat human flesh or drink human blood and turn into himself again. This belief was widely held in Europe, and similar superstitions prevail among most primitive peoples, *e.g.*, the "leopard man" of some African tribes. Lycanthropy (from Gr. = wolfman) is when the patient imagines himself a beast.

Westminster Abbey. *See* **E21.**

Westminster Cathedral, seat of the Roman Catholic Archbishop of Westminster. It was designed by J. F. Bentley and built betwen 1895 and 1910. It is of red brick, in early Christian Byzantine style with a domed campanile, 283 ft (86 m) high.

Westminster Hall, adjoining the House of Parliament, was built as a Banqueting Hall by William Rufus, and many courtly festivals were held there in succeeding centuries. King John then established the Law Courts there. It now forms a gigantic hallway, leading to the Houses of Parliament. Charles I, Sir Thomas More, and Warren Hastings were tried there.

Whale, a completely aquatic mammal; the fore- limbs are modified to form fin-like paddles and there is little external trace of the hindlimbs.

There are two major groups of whales—the *Toothed Whales*, including the Sperm-whale (Cachalot), Dolphin, Killer-whales and Porpoises; and the *Whalebone Whales*. In the latter a series of whalebone plates grow down from the roof of the mouth, and, being frayed at their edges into a hairy fringe, together constitute a filtering mechanism. The animal takes in sea water containing minute organisms on which it feeds; the mouth is then closed and the tongue raised when the water is forced out through the filter, on which is left the food. As the tongue is lowered, the whalebone plates straighten up, flicking the food on to the tongue, which transfers it to the gut. Most whale oil is obtained from the thick layer of fat under the skin (blubber), but in the Sperm-whale there is a large reserve of oil in the head. One of the major users of sperm oil is the leather industry. Ambergris used in perfumery comes from the intestine of whales.

The number of whales that may be killed in a season is limited by International Convention. Today the main whaling nations are Japan, Iceland and Norway. South Georgia was once home to the world's largest whaling station.

It is estimated that 2 million whales were killed by humans during the 20th century. In 1994 a whale sanctuary around Antarctica was established by the International Whaling Commission. The sactuary banned commercial whaling in the Southern Ocean for at least 10 years. Sadly, blue whales, the the largest and heaviest inhabitants of the ocean, have seen their population decimated. The humpback whale has now revived in numbers to over 40,000 mature individuals. Sperm whale numbers have now plummeted.

Scientists have found that Beluga whales travel thousands of miles to feast on stocks of cod and halibut after navigating by the stars or Earth's magnetic field. Today the northern right whale is threatened by busy Atlantic shipping lanes. The sperm whale is the world's loudest animal. Orca is the name for the killer whale. The *narwal* is the unicorn of the Arctic. The blue whale can weigh 200 tons, making it the biggest creature that ever lived.

Whimbrels. Somewhat similar birds to curlews, with long legs and a long down-curved beak.

Whinchats, summer visitors to Britain. These lively, orange-breasted birds properly belong to the flycatcher family (not the thrush).

Whiskers in physics and materials science (*q.v.*) are tiny rods of crystal, thinner than human hair and perhaps 1 cm long. Their importance lies in the fact that such crystals are free from the defects described on **T21**. They are also free from surface cracks and steps. This means they are immensely strong because failures of strength in ordinary solids are due to imperfections and cracks of one kind or another. Large numbers of whiskers of strong solids like graphite or silicon carbide embedded in a matrix of softer matter such as plastic make a very strong new material.

White Ants. *See* **Termites**.

White Elephant, a gift that causes the recipient more trouble or cost than it is worth; derived from an old-time custom of the Kings of Thailand who presented a white elephant to a courtier whom it was desired to ruin.

Whitehall Palace, built within sight of Westminster by Hubert de Burgh, Earl of Kent, round about 1240, was the residence of the Archbishops of York until Wolsey presented it to Henry VIII in 1530. From then until 1697, when it was burned down, it continued to be the favourite town residence of royalty, and to the Stuarts especially it was a great centre of court festivities. In those days, with its grounds, it extended from the Strand to the river. The only portion of Whitehall Palace now standing is the Banqueting Hall built by Inigo Jones, on a scaffold projected from the front of which Charles I was beheaded. A block of government buildings has been built on part of the site of the old Palace.

White House, the official residence at Washington of the President of the United States. It was built in 1792, having been designed by an Irishman, James Hoban. In 1814 British troops captured Washington and set fire to the White House.

Whitsuntide, the festival celebrating the descent of the Holy Ghost. It occurs seven weeks after Easter.

Widow Bird, certain species of African weaver birds with predominantly black plumage. In the breeding season the male birds are strikingly beautiful, with scarlet and buff markings and long tail feathers. They are social parasites and trick other birds into rearing their young.

Wig. *See* **Peruke**.

Wigeon, a surface-feeding duck of northern Europe, known in Britain more as a winter visitor than a nesting bird. It feeds in flocks in the muddy estuaries and has a characteristic "whee-oo" call.

Wildebeest. *See* **Gnu**.

Willow, a water-side-loving tree of the genus *Salix*, to which the osiers belong. The best cricket-bat blades are made from a white willow, *S. alba* var. *caerulea*, a fine tree with bluish-green leaves, mostly found in Essex. Willow is also used for polo balls. Weeping willow, *S. baby-lonica*, is native to China and is the willow seen on Old China willow-pattern plates.

Wind, air set in motion by special atmospheric conditions, is of various degrees, from a slight rustling breeze to a hurricane. Winds are *constant*, as in trade winds or anti-trade winds; *periodic*, in monsoons and other wind visitations occurring according to influences of season; *cyclonic* and *anticyclonic*, when their motion is spiral: *whirlwinds*, *hurricanes*, and *tornados*, when high temperature and great density induce extreme agitation.

Ordinarily, a wind is named from the point of the compass from which it blows, or it may be expressed in degrees from true north. The *sirocco*, the *mistral*, and the *simoom* are local forms of winds of great velocity. A *blizzard* is a biting blast of icy temperature. The winds of Antarctica are the most ferocious on the planet. Wind speeds are measured by the Beaufort Scale, devised by Francis Beaufort in 1805. The first UK storm to be named was Abigail in November 2015.

Wind Farms. Britain is the windiest country in Europe and has more offshore wind farms than anywhere else in Europe. The biggest offshore windfarm in the world was inaugurated in the North Sea in September 2009. Horns Rev 2 is 30km off the coast of Jutland. The huge Walney offshore windfarm (off the coast of Cumbria) is due to open in 2018. Huge projects are planned for Dogger Bank Teesside and the Hornsea project, 75 miles off Grimsby. The earliest windfarm in Britain opened in 1991 near Delabole in Cornwall.

Windmills were in use in Persia by A.D. 644. However, they were not much seen in Europe before the 13th cent. Wind sawmills were invented by a Dutchman in the 17th cent., and one was erected near the Strand in London in 1633. Great improvements have been made in these mills, especially in the USA, where, by the application of the windshaft principle, much space is saved and the mills can be used for pumping, grinding *etc*.

Among fine examples of working-mill restorations are Stainsby watermill in Derbyshire, Sacrewell in Peterborough and Gelli Groes in Gwent.

Windows (Old Norse *vindauga* = wind-eye), an opening in a wall of a building to admit light and air, and to afford a view of what is outside. In northern Europe windows, as the derivation of the word implies, were first used for ventilation and glass was not used in private houses before the end of the 12th cent. In early Gothic (12th cent.) windows were still small and narrow, with rounded heads. In Early English (13th cent.) they became longer and the heads pointed. In the Decorated period (14th cent.) windows were mullioned (divided by slender bars into panes) and the pointed heads often traceried.

In Tudor times windows were larger and the bay-window (projecting from the wall) and the oriel window (*q.v.*) were much in vogue; in the late 18th cent. curved bays (called bowwindows) became fashionable. Sash windows (invented by the English) with wooden frames and divided into equal rectangular panes were used in Queen Anne and Georgian houses. Their design was influenced by a passion for symmetry; they were very efficient ventilators. The French window reaches to the floor and has double casements opening as doors. A Dormer window is a vertical window set on the sloping side of a roof.

Woad, a plant (*Isastis tinctoria*) largely used by ancient Britons for the blue dye obtained from the leaves. It is a biennial plant belonging to the same family (*Cruciferae*) as the wallflower. It is now being considered as a potential source of ink for computer printers and as an anti-tumour agent in the battle against cancer.

Wolverine. *See* **Glutton.**

Wolves, well-known carnivorous animals still found in many parts of Europe, but not existing in Britain since the middle of the 17th cent. The last wolf in Scotland was killed in 1680. They usually hunt in packs and live in family groups. In parts of Europe, careful conservation has seen their numbers increase, as in north-west Spain. Grey wolves (Europe's second largest predator after the brown bear) have now returned to Germany. They howl to proclaim territory.

Women's Institutes (**WI**) were originally founded in Canada in 1897. The movement spread to Britain, with the first branch opening in Wales in 1915. It has around 215,000 members in the UK.

Woodcock, a wading bird, valued for its flesh. It is a member of the snipe family, and breeds in Britain. The parent bird is able to carry its young between its thigh and body when flying to and from the feeding spots. It is one of the birds protected by the Game Laws.

Woodhenge, popular name for the traces of an elaborate wooden temple, dating back 5,000 years, found at Stanton Drew in Somerset in 1997.

Woodpecker, a familiar tree-climbing, insectivorous bird of conspicuous plumage, of which three species are found in Britain, the green woodpecker or yaffle (because of its harsh cry), the great spotted, and the lesser spotted.

They build in the hollows of trees. Yaffle has a long sticky tongue for licking up ground insects, especially ants. The great and lesser woodpeckers obtain insects by digging into tree trunks with strong, chisel-like bills, spearing the insects with a sharp tongue. The metallic drumming sound made by the birds in spring is thought to be caused by their beaks hammering away at some hard resounding substance. Their numbers have declined markedly in recent years.

Wood Pigeon. *See* **Ring Dove.**

Wood's Metal, an alloy with a very low melting point (65°C, which is under 150°F) so that a spoon made of it will melt when used to stir a cup of tea. Contains bismuth 4 parts, lead 2 parts, tin 1 part, cadmium 1 part. Its use as a heat exchanger has now been superseded by silicone oils, which have a wider temperature range.

Woodworm. Four beetles are mainly responsible for woodworm damage: common furniture beetle (*Anobium punctatum*), powder post beetle (*Lyctus brunneus*), death watch beetle (*Xestobium rufovillosum*), and house longhorn beetle (*Hylotrupes bajulus*). Particular attention should be paid to wood in damp, dark and out-of-the-way places, and the backs and underneaths of furniture. The most frequent cause of woodworm damage is the common furniture beetle (*q.v.*).

Wool is a fibre, made up of very long protein molecules. It has been largely grown and used in the manufacture of cloth in England since before the Roman invasion. It is grown on the backs of sheep, and is of various kinds, according to the breed of sheep from which it is derived. Wool differs from hair in that it has a wavy, serrated fibre, its curl being a notable characteristic, whereas hair has a smooth surface comparatively free from serratures. Long wools were mostly used for the manufacture of worsted goods, and short wools for woollen cloths.

The finest wools are obtained from the fleece of the Spanish merino sheep. Australia, New Zealand, Argentina and South Africa are among the greatest wool-producing countries. China is the world's largest consumer of wool.

Woolsack, the name given to the seat formerly occupied by the Lord Chancellor in the House of Lords. It is a large square bag of wool, without back or arms, covered with red cloth. At the time when it was first used, in the reign of Edward III, wool was the great staple commodity of the country and, it is said, chosen for the seat of judges as a constant reminder of the main source of the national wealth. The Lord Chancellor was "appointed to the woolsack". Since 2006 the Woolsack has been occupied by the Lord Speaker.

Wombat, small Australian marsupial mammal whose survival is now threatened. by a mysterious skin disease. It resembles a small bear.

Workers' Educational Association (**WEA**), the largest voluntary sector provider of adult education courses in the UK. Founded in 1903 to support the educational needs of working people.

World Heritage Sites, established under the World Heritage Convention to secure lasting protection for sites of outstanding universal value. In Britain the sites include Canterbury Cathedral; Durham Cathedral and Castle; Studley Royal Gardens and Fountains Abbey; Ironbridge Gorge; the prehistoric stone circles of Stonehenge and Avebury; Blenheim Palace; the city of Bath; Hadrian's Wall; the Tower of London; the Palace of Westminster; the islands of St Kilda; Edinburgh Old and New Towns; the North Wales castles and town walls of Edward I, the Giants' Causeway, in Northern Ireland and maritime Greenwich. England's first natural World Heritage Site is the 95-mile 'Jurassic Coast', in Dorset and Devon. The UK now has 29 World Heritage sites (the Forth Bridge attained this status in 2015). There are now around 1,017 sites worldwide.

Around the world, UNESCO's sites include the Great Wall of China; the Pyramids and Grand Canyon; the Taj Mahal; Persepolis, the capital of ancient Persia; Australia's Great Barrier Reef and the Inca town on Machu Picchu in Peru. Recently designated sites include Robben Island, the Darjeeling Himalayan railway, the Red Fort in Delhi, the Shia holy city of Samarra and the old town of Corfu.

World Population. According to United Nations sources world population has now reached around 7·25 billion. Over half live in Asia, where the population of India will overtake China by 2022.

Different countries are at different stages in a demographic transition from the stability provided by a combination of high birth rate and high death rate to that provided by a combination of low birth rate and low death rate. Their recent population history and current trend of growth, the age-structure of their population, and consequently their population potential for the near future are all widely different. Most rapid growth is in Africa with rates of over 3 per cent in some countries. (Africa could have 4·2 billion people by 2099).

It is estimated that about one in 25 of all human beings who have ever lived are alive today. It took 115 years for the world's population to rise from one to two thousand million; in a further 35 years it rose from two thousand million to three; in only 15 more years from four to five thousand million. It is estimated to reach over 9·7 billion by 2050 and perhaps 11·2 billion by 2099.

In 1970, only two cities had a population of over 10 million. Today there are 21 such conurbations, spread from China and Japan to Mexico.

The countries with the largest populations are China (1·39 bn) and India (1·27 bn), followed by the USA, Indonesia, Brazil and Pakistan. *See also* **Longevity** (**L68**) for facts on life expectancy.

Wrasse, a large reef fish. Threatened with extinction because it is a luxury food in Asia. Recent film footage has shown a tuskfish (a type of wrasse) using tools.

Wren, a family of small passerine birds possessing upturned tails, most abundant in South America. The British species is an interesting singing bird with a surprising loud note for its size.

X

Xenoliths, the term for those bits of rock trapped when lava hardens.

Xenon a rare gaseous element, no.54, symbol Xe, occurring in minute quantities in the atmosphere, discovered by Sir William Ramsay and M. W. Travers in 1898. *See* **Rare Gases.**

X-Rays were discovered in 1895 by Professor Röntgen, of Wurzburg. X-rays are produced when heavy metal atoms (*e.g.* tungsten) are struck by electrons of sufficient energy. X-rays are now commonly used to examine the internal structure of many opaque objects. In medicine, industry and for security, examination may be conducted without physical invasion. X-rays may also be used to probe the structure of matter, for example the atomic structure of crystals. The discovery in the 1960s that cosmic objects emitted intense X-rays has led to many important discoveries.

Xylem, the woody tissue of higher plants whose function is to conduct water and mineral salts upwards, and to provide mechanical support.

Y

Yacht, a light vessel now much used for pleasure trips and racing. The first yachting club was the Cork Harbour Club, started about 1720; and in 1812 the Royal Yacht Squadron was founded at Cowes. The Royal Thames Yacht Club dates from 1823.

Yak, a long-haired ox, found in Tibet. Used as a beast of burden, and also kept for milk and meat.

Yard, a standard measure of 36 in, the word being derived from the Saxon gryd, or rod. The yard and pound are now defined by reference to the metre and the kilogram: yard = 0·9144 of a metre; pound = 0·45359237 of a kilogram. By international agreement the metre is defined by reference to the wavelength of krypton-86 light.

Yellowhammer, a common British bird of the bunting family, of lemon-yellow and brown plumage. Nests on or near the ground. Recent years have seen its numbers decline. Its nickname is the Scottish canary.

Yeomen of the Guard are a body of Foot Guards established in the reign of Henry VII for the protection of the Royal Person. Yeomen are now about 100 in number, and their duties consist in being present on ceremonial State occasions, the yearly distribution of Maundy Money, and the searching of the vaults of the Houses of Parliament on Guy Fawkes' day.

"Beefeater" is the nickname of both Yeomen of the Guard and Yeomen Warders of the Tower, and they both wear the Tudor style of dress, but with one distinction, the Yeomen of the Guard wear a cross belt, the Warders do not. The first female Beefeater began work in 2007.

Yeti, opinions differ as to whether this is a mythical inhabitant of the Himalayas, a primitive primate or bear. Evidence produced in 2013 suggested the yeti is an animal descended from an ancient hybrid species of polar bear. In North America, the creature is known as *bigfoot* or *sasquatch*, but no hard evidence of its existence has been found.

Yiddish, language whose basic grammar and vocabulary is Germanic (but it is a complete language in itself). It was the language of most Jews of Eastern Europe before the Second World War.

Young Offenders' Institutions. The Criminal Justice Act 1988 replaced youth custody and detention centre training with the sentence of detention in a young offender institution for all young people aged 15 to 20 whom the courts decided needed custodial treatment. More recently the Crime and Disorder Act 1998 modified this sentence with the creation of the detention and training order, combining custody and community supervision, for young offenders under the age of 18. A government review in 2016 called for the abandonment of the present system.

Ytterbium, a chemical, no.70, symbol Yb, element discovered by Urbain in 1907; one of the group of rare earth metals.

Yttrium, a chemical element, no.39, symbol Y, discovered by Mosander in 1842. It is found in a few rare minerals such as gadolinite, xenotine, fergusonite and euxenite. One of the group of rare earth metals.

Yurt. A Mongolian tent, circular in shape and made of skins. Used by nomads.

Z

Zamboni Pile, a dry galvanic battery, which can provide small amounts of high-voltage current over a very long time. At Oxford a couple of Zamboni piles have kept a bell ringing for over a hundred years. These piles in the second world war were perfected and produced in quantity, being the most convenient source of current for infra-red signalling devices.

Zebra, an African quadruped of whitish-grey colour, with regular black stripings, perhaps the most beautiful member of the Equine family. Rather larger than an ass and smaller than the horse, it has a tufted tail, is of light build, wild and fleet of foot. The Zebra may be threatened with extinction—already the fate of the Quagga species—because of its slaughter by man for its beautiful skin. Each year in Africa, zebra go on a spectacular migration to their breeding grounds, making the longest land migration in Africa. The name derives from *zevra*, an old Portuguese word for wild ass. Theories that their stripes kept away flies or lions have been disproved.

Zebra Crossings, the familiar road crossings for pedestrians were first introduced in 1949. Originally blue and yellow before becoming black and white.

Zenith, the highest point in the heavens above an observer's head, the opposite pole to the nadir.

Zeppelin, name of the airships developed in the First World War by Germany, kept aloft by hydrogen. There were 52 zeppelin raids on Britain killing 600 civilians.The loss of the *Hindenburg*, which burst into flames in 1937 trying to land at Lakehurst, New Jersey, put an end to their popularity.

Zero, the cypher signifying nothing originally came from China. The West is indebted to the Arabs for it, who themselves obtained it from India and passed it to European mathematicians towards the end of the Middle Ages. The zero has also been found in Babylonian cuneiform. The Greeks had no such symbol, which hindered the development of their mathematics. The use of zero led to the invention of decimal fractions and to the later developments in astronomy, physics and chemistry. For absolute zero on the temperature scale *see* **Absolute Temperature.**

Ziggurats, famous Babylonian religious centres, among the finest monuments of the ancient world. They had a distinctive terraced structure.

Zinc, a familiar metallic element, no.30, symbol Zn, known to the ancients, and used by them in the making of brass. It occurs as the sulphide, carbonate, *etc*. The ores of zinc are crushed, roasted and reduced with coal. In combination with copper it constitutes the familiar alloy called brass, and zinc itself is much used for roofing *etc*.

Zirconium, metallic element, no.40, symbol Zr, was discovered by Klaproth in the sand of the rivers of Sri Lanka in 1789. The crystalline metal is white, soft and ductile; in its amorphous condition it is a blue-black powder. Zirconium is used in atomic reactors as containers for fuel elements.

Zodiac, an imaginary zone or belt of the sky enclosing the circuit over which the principal planets travel. It is divided into 12 equal spaces of 30 degrees each, comprising respectively the 12 signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces. The idea of the zodiac originated with the Babylonians about 2000 B.C. and passed by way of the Greeks to the Western world.

The traditional 12 signs of the zodiac were thrown into turmoil when a 13th sign – Ophiucus – was added by astrologers. *See also* **G25**.

Zodiacal Band, a very faint band of light sometimes seen stretching along the ecliptic joining the Zodiacal Light to the Gegenschein and, like them, caused by the reflection of sunlight from interplanetary dust particles.

Zodiacal Light, a faint cone of light occasionally seen stretching along the zodiac from the western horizon after evening twilight or the eastern horizon before morning twilight. It is believed to be due to the scattering of the sun's light by dust particles in orbit round the sun and extending beyond the earth. Recent observations at the high altitudes station at Chacaltaya in the Andes suggest that the dust is travelling round the sun in regular planetary orbits.

Zonda, a warm moist wind in Argentina of great velocity blowing from the north or northwest, and, like the Sirocco in Southern Europe, causing much discomfort. It happens when a depression is moving across the pampas, bringing with it a mass of air from the humid tropics. It is followed by a refreshing wind from the south east.

Zoological Gardens of London were opened in 1828, and belong to the Zoological Society of London. They contain one of the largest collections of living animals in the world (*c.* 18,000 animals).

The Society maintains an open-air zoo at Whipsnade, on the edge of Dunstable Downs.

Zoology, the branch of science concerned with animal life, anatomy and behaviour.

Zulus, one of the peoples of South Africa. Prior to white rule, the Zulus were ruled by a succession of paramount chiefs, reaching the zenith of their powers under King Shaka in the 1820s. Their power was crushed by the British at Ulundi in 1879 (after the Zulus had earlier routed the British at Isandlwana).

LITERARY COMPANION

This section provides a concise outline of English Literature from the earliest times to the first decades of the present century. Arranged as a chronological survey, it covers such great poets and writers as Chaucer, Shakespeare, Milton and Dickens as well as the major figures of more recent times. Also included are surveys of twentieth century poetry and drama.

M2

TABLE OF CONTENTS

Old English Literature 4
- *Beowulf* and Old English Poetry 4
- Old English Prose 4

Middle English Literature 4
- Morality Plays and Mystery Plays 4
- William Langland 4
- The Gawain Poet 4
- Geoffrey Chaucer 5
- The Ballad 6
- Morality and Mystery Plays 6
- Sir Thomas Malory 6

Renaissance Literature 6
- Renaissance Poetry and Prose 6
- Wyatt, Howard and Sidney 6
- Edmund Spenser 6
- Christopher Marlowe 6
- The University Wits 7
- Francis Bacon 7
- William Shakespeare 7

Seventeenth-Century Literature 9
- Jacobean Drama 9
- John Webster and John Ford 9
- Ben Jonson 9
- The Metaphysical Poets 9
- John Donne 9
- George Herbert 10
- Andrew Marvell 10
- Women Writers of the Seventeenth Century 10
- Restoration Drama 10
- John Bunyan 10
- John Milton 11
- Two Diarists: Pepys and Evelyn 11
- John Dryden 11
- John Wilmot, Earl of Rochester 12

The Eighteenth-Century Novel 12
- Daniel Defoe 12
- Samuel Richardson 12
- Henry Fielding 12
- Tobias Smollett 13
- Laurence Sterne 13
- The Gothic Novel 13
- Other Novelists 14

The English Augustans 14
- Jonathan Swift 14
- Alexander Pope 14
- Samuel Johnson 15
- Personal Writings 15
- The Periodical Essay 16
- Poetry of Landscape and Reflection 16
- Eighteenth-Century Drama 16
- Oliver Goldsmith 16
- Richard Brinsley Sheridan 16

The English Romantics 16
- William Blake 16
- William Wordsworth 17

LITERARY COMPANION

SURVEY OF ENGLISH LITERATURE

OLD ENGLISH LITERATURE

The origins of English Literature go back before the Norman Conquest, when a rich literary and cultural tradition, centred in the monasteries that were the repositories of early English Christianity, was developed. While much of the writing that emerged from the monasteries was written in Latin, Old English (or Anglo-Saxon), the language of the Germanic peoples who had first invaded England in the fifth century, emerged as one of the most prestigious early vernacular languages.

Beowulf and Old English Poetry

Old English poetry was mainly written in alliterative verse. It boasts one undisputed masterpiece, *Beowulf*, a heroic epic probably composed in the eighth century and preserved in a single tenth century manuscript (the *Nowell Codex* in the British Library). In the first part, the Scandinavian protagonist, Beowulf, successfully defends his uncle's kingdom by killing the monster Grendel and, on the following night, Grendel's mother. In the second part, set fifty years later, Beowulf has himself become king. He once again saves his people, this time by slaying a dragon, but is fatally wounded in the process. *Beowulf* is considered a great poem, because of its assured epic tone, its moving alliterative verse and its powerful heroic narrative, which involves complex parallels between episodes. It also provides a detailed picture of a pagan Germanic culture, centred on an aristocratic mead hall and kinship loyalties. However, this culture is observed at a time of transition and numerous passages contain a strong vein of Christian morality.

Other notable Anglo-Saxon poems also bring Germanic and Christian elements together. They include the elegies, *The Wanderer* and *The Seafarer*, *The Battle of Maldon*, which takes the heroic defeat of an English army by the Danes in 991 as its subject and more generally seems to be a celebration of fighting for a lost cause, poems on Old Testament themes such as *Judith* and *Genesis A* and *Genesis B* and visionary Christian works such as *The Dream of the Rood*.

Old English Prose

The best-known Old English prose work is the *Anglo-Saxon Chronicle*, a collection of texts that provides an invaluable historical record of events in the period, narrated in a circumstantial style that lacks the literary merit of the classics of Old English verse. The *Chronicle* originated in the reign of Alfred the Great, King of Wessex (871–99), a major patron of learning who was responsible for the translation of several important Latin works into English. These include Boethius's *Consolation of Philosophy*, St. Augustine's *Soliloquies* and the *Ecclesiastical History of the English People* by the Venerable Bede, an English monk who lived his life in Northumbria. Bede's *History* (*c.* 771) is widely regarded as the most important English work of its kind written before the Renaissance. The prose literature of the Anglo-Saxon period is also notable for homilies and translations of Classical, as well as Christian, texts.

After 1066, as a consequence of Norman rule, Old English lost ground to French and Latin as a literary language, particularly since it existed in numerous regional and local dialects. The records in the *Anglo-Saxon Chronicle* continue into the twelfth century, but the post-Norman Conquest entries are characterized by linguistic variations.

MIDDLE ENGLISH LITERATURE

The twelfth and thirteenth centuries were a comparatively quiet era in the annals of English literature. In contrast, the fourteenth century saw an efflorescence of writing in the various dialects of English. Foremost among the authors of this period was Geoffrey Chaucer, who wrote in the East Midland dialect of English, which gradually became accepted as the standard form of the language, although orthography and pronunciation continued to be extremely varied. Other major writers of the period included William Langland, the so-called Gawain poet and John Gower, who wrote in English, Latin and French. Towards the end of the medieval period, literature moved into a new phase with the invention of the printing press and one of the books published by the pioneer English printer, William Caxton, was Sir Thomas Malory's masterpiece the *Morte D'Arthur*, which crystallized many of the concerns of the Age of Chivalry.

Morality Plays and Mystery Plays

Other significant literature of the period includes a broad range of anonymous oral ballads and equally anonymous religious and secular lyrics. The period also saw the beginnings of significant English drama in the shape of morality plays and the cycles of mystery plays, which were popular from the thirteenth to the sixteenth century. Although much of the literature of the medieval era is religious in outlook, reflecting the extent to which social life was shaped by Christian belief, the emergence of a writer such as Chaucer signals a more secular approach that looks forward to the Humanist spirit of the Renaissance. Elsewhere spiritual and secular concerns are not so sharply divided as the modern reader may initially suppose: the mystery plays were performed by trade guilds and included episodes that deviated from their ostensibly devotional purpose. Similarly medieval religious lyrics frequently employ the language of profane love in sacred contexts.

William Langland

Langland's allegorical masterpiece, *Piers Plowman* exists in three versions, dating from around 1360 to 1387. Little is known about the poet himself, though he wrote in the West Midlands dialect and his work demonstrates a familiarity with parts of modern Worcestershire. The main form of *Piers Plowman* is a dream vision, but it does not employ this mode consistently. It moves between abstract personification and specific representation of aspects of late fourteenth-century social life. Its dreamer protagonist experiences considerable difficulties as he wrestles with personifications of his moral weaknesses and the poem ends with his realization that his quest for spiritual regeneration must commence all over again. At the same time, through a series of interlocking allegories, it represents the corrupt state of secular society and the Church. The figure of Piers Plowman appears intermittently as an embodiment of the ideal Christian life, as incarnated in a distinctively West Midlands rural form.

The Gawain Poet

Sir Gawain and the Green Knight is the best-known work of a poet who is also believed to have composed three religious allegories, *Pearl*, *Patience* and *Cleanness*, which have survived in the same manuscript. The poems were written in the West Midlands dialect of English in the second half of the fourteenth century. There is no external evidence to corroborate the assumption that all four are the work of a single author, but internal evidence and their common source suggest this. *Gawain and the Green Knight* is an Arthurian romance written in alliterative verse. Its intricate narrative tells how a mysterious outsider, the green knight, comes to King Arthur's court one New Year's Eve and challenges any of the knights to deal him a single axe-blow, to be returned by the green knight a year later. Sir Gawain accepts the challenge and delivers an apparently mortal blow when he decapitates the green knight. However, the knight picks up his head and leaves, reminding Gawain of his promise. The following year Gawain journeys to the knight's home at the Green Chapel and experiences a series of events in which his integrity is tested and finally found partly wanting. He is punished accordingly, when the third of three feints the knight delivers lightly nicks his neck. The main events of the poem have been interpreted as an allegory of seasonal renewal, in which chivalric values are thrown into conflict with an older set of English values associated with pagan traditions of ritual regeneration.

Pearl, *Patience* and *Cleanness* are also moral homilies, but are more obviously Christian. *Pearl* is a dream allegory about death containing a vision of the New Jerusalem from the *Book of Revelation*. *Patience* takes its didactic lesson from the story of Jonah. *Cleanness* (also known as *Purity*) employs a broad range of Old and New Testament references.

Geoffrey Chaucer (c. 1343–1400)

In addition to being the foremost English writer of his era, Chaucer held a number of prominent public offices, initially under the patronage of John of Gaunt and his *Book of the Duchess* (*c.* 1369) is generally considered to be an elegy for Gaunt's wife, Blanche of Lancaster. The son of a London vintner, Chaucer studied at the Inner Temple and saw military service in France during Edward III's campaigns in the Hundred Years War. He held a number of positions at court and travelled abroad on diplomatic missions to France and Italy, which was to be a particularly important influence on his development as a writer and where he may have met Boccaccio and Petrarch. In 1374 he became a customs controller in the port of London. During the last two decades of his life, when he was composing his *magnum opus*, *The Canterbury Tales*, he held appointments as knight of the shire for Kent, Clerk of the King's Works and a deputy forester in Somerset. On his death, he was buried in Westminster Abbey.

When Edmund Spenser was laid to rest beside him in 1599, their tombs became the basis of Poets' Corner, though Chaucer's burial in the Abbey was not in recognition of his poetic achievement, but because he had been Clerk of Works in the building of Westminster Palace.

Chaucer's Masterpiece

Chaucer's masterpiece, *The Canterbury Tales* (begun *c.* 1387) comprises the General Prologue, which describes the coming together of a group of travellers about to embark on a pilgrimage to Thomas à Becket's shrine in Canterbury, at the Tabard Inn in Southwark, and twenty-four tales told on the pilgrimage itself: two by the figure of Chaucer himself; the remainder by members of the company. It is often believed to have been inspired by Boccaccio's *Decameron*, in which a hundred tales are told during the course of ten days by ten fugitives from plague-ridden Florence. However, Chaucer does not acknowledge a direct debt to Boccaccio and there are other precedents for linked series of stories in the medieval period. The pilgrims' tavern host, Harry Bailly, proposes that each of them should tell four stories, two on the road to Canterbury and two on the return journey; and he promises the teller of the best tale a free supper. This scheme is never completed and the prize is not awarded, but *The Canterbury Tales* remains the outstanding literary achievement of the fourteenth century, offering a panoramic view of the various orders of society, lay and clerical, with each of the pilgrims being subject to scrutiny by Chaucer's discerning and judicious eye. Incomplete though it is, the series' linking of characters and tales and its exchanges of dialogue between the various pilgrims lend it a degree of dramatic unity rare in such sequences.

The General Prologue provides thumbnail sketches of twenty-one of the pilgrims, each of whom is realized as a rounded figure through a deft and economic choice of characterizing physical and moral qualities. Chaucer's tone varies and while some of the characters are viewed as exemplars of virtue, he characteristically draws attention to their failings through the medium of a laconic irony, which moves between gentle mockery and more savage condemnation and establishes him as the first great English satirist. Similarly, some of the characters, such as "the "verray parfit gentil knight", are rendered as idealized types, but more generally the portraiture of the Prologue is highly individualized and moves away from the allegorical characterization typical of much medieval literature. Its characters provide a vivid cross-section of the society of the period and collectively can be seen as a social microcosm. They include: representatives of chivalric society, such as the knight and his squire; clerical figures, including a monk, a friar and a prioress; and people engaged in a wide variety of secular occupations, among them a lawyer, a miller, a merchant, a cook and a physician.

Though the majority of the pilgrims are men and the few female travellers are mainly members of religious orders, Chaucer's ensemble is notable for the presence of one of the most vividly realized female characters in early English writing, the Wife of Bath.

Variety in Chaucer's Tales

The tales themselves demonstrate a remarkable variety of range, tone and subject-matter. Taken together, they offer an encyclopaedic overview of many of the literary and cultural concerns of the period. They move between tragic romances such as *The Knight's Tale*, narratives that probe complex moral issues, such as *The Franklin's Tale*, parodies such as Chaucer's *Tale of Sir Thopas* and ribald and bawdy comic works, such as *The Miller's Tale*. The predominant metre of the work is rhyming couplets, but again Chaucer's approach is exceptionally diverse: he employs a wide range of verse forms as well as occasionally, as in the *Tale of Melibee*, writing in prose. The tales draw on an extensive range of medieval literary forms, including saints' lives, verse romance, *fabliau* (a fable form, often centred on a battle of wits and containing scatological and other forms of broad comic humour) and homily.

Use of Ambiguity

In *The Nun's Priest's Tale*, widely regarded as a work that typifies the ambiguity of Chaucer's tone, an apparently mock-heroic animal fable, which moves between witty playfulness and complex philosophical commentary, ends with a directive to take its pious moral seriously, leaving readers to decide whether to follow this instruction or to view it as an example of Chaucer's sly irony. *The Wife of Bath's Tale* is preceded by a lengthy prologue in which the wife provides an autobiographical account of her life, including details of her five marriages. This draws on anti-feminist literary conventions of the period, but again Chaucer's complexity of tone opens up the possibility of reading the Wife as a prototype feminist. In contrast, her tale, which is taken from the popular medieval story of "the loathly lady", is uncharacteristically serious. It does, however, demonstrate continuity with its prologue, since it is also about women's "maistrie" (or sovereignty) over men, suggesting that Chaucer may be more concerned with thematic links than consistent characterization.

Other Works by Chaucer

After *The Canterbury Tales*, *Troilus and Criseyde* (*c.* 1385) is generally considered to be Chaucer's finest achievement. Written in rhyme royal, it is a narrative poem of over 8,000 lines, which has been called the first English novel. Set inside Troy during the Trojan War, it describes how the warrior Troilus falls in love with Criseyde, how they are brought together by her uncle and guardian Pandare, how Criseyde subsequently betrays Troilus after they have been separated and how a grief-stricken Troilus is killed in battle. Chaucer appears to have taken the story from Boccaccio's *Il Filostrato*, but he develops his source-material into a highly complex moral fable, notable for the sophisticated rendition of its protagonists' psychologies. Typically Chaucerian in its ambiguity of tone, the poem mainly suggests a lofty, tragic vision of experience, which emphasizes the vanity of human life.

However, it also includes comedy, mainly in the characterization of Pandare, and its closing sections contain a series of Christian and other moralizing reflections, which partly negate the tragic view.

Chaucer also wrote numerous other poems, several of which adapted French and Italian models into the English vernacular tradition, which he played a central part in developing. *The Book of the Duchess* and *The Parliament of Fowls* (*c.* 1380) were inspired by the French tradition of the allegorical dream poem. In the latter, a group of birds engage in a debate about marriage, which contrasts the ideal of courtly love with a more pragmatic approach. In the unfinished *House of Fame* (*c.* 1379), Chaucer parodied aspects of Dante's *Divine Comedy* in a cryptic dream vision, whose purpose remains uncertain. His other works include translations of Boethius's *De Consolatione* (*On the Consolation of Philosophy*) and part of one of the great classics of medieval romance literature, the French *Roman de la Rose*; and the prose work, *Treatise on the Astrolabe*, which is believed to have been written for his son, "little Lewis".

The Ballad

Ballads are short narrative poems of anonymous composition, originally intended to be sung. They customarily express and enforce aspects of the folk imagination and as a consequence of oral transmission, usually exist in several versions. The most popular stanza form employed in ballads involves alternating four-beat and three-beat lines and a similarly alternating rhyme scheme (abab), but ballads also employ numerous other forms. The ballad particularly flourished in Northern England and Scotland from around 1200 to 1700. Popular ballads of the period include "Lord Randal", "Sir Patrick Spens", "Edward", "The Unquiet Grave" and "Thomas Rhymer". Ballads treat a broad range of subjects, but prominent types deal with tragic family themes, romantic love, the supernatural and the exploits of outlaws such as Robin Hood.

Morality and Mystery Plays

Often grouped together, morality and mystery plays represent two distinct forms of medieval drama. Morality plays were dramatized allegories of virtues and vices fighting for a human soul. The first morality plays date from the early fifteenth century, but the form continued to be popular in the Elizabethan period at the time of the upheavals brought about by the Reformation. *The Castle of Perseverance* (*c.* 1420), *Mankind* (*c.* 1465) and *Everyman* (*c.* 1510) are the best-known examples of the form. In John Skelton's *Magnyfycence* (*c.* 1515), a late example of the genre, an excessively magnanimous prince is ruined by his generosity, before being educated into more prudent behaviour by qualities such as Good Hope and Perseverance.

In England mystery plays, sometimes also known as "miracle plays", were based on Biblical subjects. (In other parts of Europe the term "miracle plays" was reserved for stories of saints' lives.) Initially mystery plays were staged in churches on religious holidays such as Corpus Christi and Whitsuntide. Later they became more secular and were staged in market places by trade guilds. Hence the use of the name "mystery", which derives from the Middle English word for a skilled trade. Increasingly, the plays were performed as sequences.

Cycles of English mystery plays from York, Chester, Coventry and Wakefield have come down to posterity almost intact. They are notable for their blend of simple homiletic instruction and interludes of broad comic portraiture.

Sir Thomas Malory (died *c.* 1471)

One of the earliest books printed in England, Malory's *Morte D'Arthur* (1485; written *c.* 1469) is the greatest English contribution to "the matter of Britain", the widely circulating corpus of stories about the Arthurian legend. Written in prose, the *Morte D'Arthur* is divided into eight tales and twenty-one books. The tales begin with the story of Arthur's birth and early life and the establishment of the Round Table and conclude with a narrative of the collapse of his court, when he discovers his wife Guinevere's adultery with Sir Lancelot, and his subsequent death in battle. The fifth tale, which tells the story of Tristram and Isolde (Tristan and Iseult), occupies almost half the work.

RENAISSANCE LITERATURE

Renaissance Poetry and Prose

During the Renaissance period, writers and thinkers turned to the Greek and Roman classics for cultural inspiration, replacing medieval literature's absorption in Christian and chivalric concerns with a Humanist spirit that encouraged scientific inquiry, a more eclectic approach to learning and an expansionist vigour that was as keen to develop new literary forms as it was to discover new worlds.

Characteristically, Renaissance men, such as Sir Walter Raleigh (*c.* 1554–1618), the famous courtier and adventurer, moved between active involvement in the public life of the day and literary and cultural pursuits, without becoming dilettantes. Raleigh not only wrote accounts of his travels in the New World, such as *A Discovery of the Empire of Guiana* (1596), and *The History of the World* (1614), but also a significant body of poetry, notable for its melancholy reflections on the transitory nature of existence. Conversely, John Donne (*see below*), who is best known as a poet, accompanied the Earl of Essex and Raleigh on expeditions against the Spanish. Henry VIII's Lord Chancellor, Sir Thomas More (1478–1535), who was executed for his unbending allegiance to papal authority, produced *Utopia* (1515) which gave a name to the genre of writing about ideal fictional states founded nearly two millennia earlier by Plato's *Republic*.

Wyatt, Howard and Sidney

Sir Thomas Wyatt (*c.* 1503-42) and Henry Howard, Earl of Surrey (*c.* 1517–47) pioneered several of the metres and conventions that became staples of English verse during the next three centuries. They introduced the Petrarchan form of the sonnet and *terza rima*, the three-line stanza used by Dante in the *Divine Comedy*, into English; and Surrey's translation of parts of Virgil's *Aeneid* established blank verse (unrhymed iambic pentameters) as the standard metre of much subsequent English poetry, including Elizabethan dramatic verse and narrative long poems, varying from Milton's *Paradise Lost* to Wordsworth's *Prelude*. Neither Wyatt nor Surrey saw their poems published in their own lifetime. Both were better known for their public activities. So too was another Renaissance man, Sir Philip Sidney (1554–86), whose major works were also published posthumously. His *Astrophel and Stella* (1591) is the most famous of the pre-Shakespearean sonnet sequences. Sidney's *Arcadia* (1590) blends prose romance with verse eclogue to create an idealized, pastoral world, inspired by Virgil and other classical poets.

Edmund Spenser (*c.* 1552–99)

Spenser's masterpiece, *The Faerie Queene* (1590–96) is both a definitive work of the Elizabethan age, drawing on the heroic traditions of classical epic, and the last great English example of a medieval romance. The "queene" of the title is Gloriana, or Elizabeth I, and the poet celebrates her reign and authority in a series of adventures set in the courtly past, in each of which one of her knights exemplifies a particular virtue in action. Spenser invented his own unique nine-line stanza (with the rhyme-scheme ababbcbcc). This became known as the Spenserian stanza and was subsequently used by Romantic poets such as Byron and Keats in an endeavour to recapture the spirit of the medieval world, in a manner not dissimilar from Spenser's attempt to invest his own period with medieval values. Spenser's other works include a pastoral sequence expressing nostalgia for a past golden age, *The Shephearde's Calender* (1579), a collection of love sonnets, *Amoretti* (1595) and the marriage song *Epithalamion* (1595).

Christopher Marlowe (1564–93)

Marlowe preceded Shakespeare as the first great tragic dramatist of the Elizabethan age. He also established the blank verse line as the dominant metre of the drama of the period, refining its use beyond that of its earlier exponents. His plays mostly deal with megalomaniac protagonists, whose obsession with an extreme form of power or knowledge leads to their downfall. *Tamburlaine the Great* (Parts I and II, 1587) narrates the rise and fall of a military overreacher in characteristically hyperbolic language. In *The Jew of Malta* (*c.* 1590) the protagonist, Barabas, is a Machiavellian hero-villain, whose revenge on the Christian society that confiscates his wealth attracts a good deal of sympathy.

More complex in characterization than Marlowe's earlier tragedies, but less extravagant in its versification, *Edward II* (1592) did much to establish the genre of the Elizabethan historical play. It anticipates Shakespeare's *Richard II* as a tragedy of a weak king betrayed by favourites and a tendency towards histrionic behaviour, though Marlowe places more emphasis on shifting fortune as a cause of tragedy.

Dr Faustus (1594) is a tragedy of damnation, which also anticipates Shakespeare, in this case *Macbeth*, in certain respects. It is, however, more explicitly theological, demonstrating a debt to the medieval morality play (*see above*). It tells the story of the necromancer Faust, who sells his soul to the Devil in return for twenty-four years during which he will enjoy infinite power and knowledge. Though parts of the text are disputed, it contains some of Marlowe's finest verse, including the protagonist's famous response to a vision of Helen of Troy, whom he summons up as an ideal of womanhood: "Was this the face that launched a thousand ships?"; and his poignant monologue as he awaits his tragic fate: "See, see, where Christ's blood streams in the firmament!"

Marlowe's work as a poet includes *Hero and Leander* (1598) and the song "The Passionate Shepherd to His Love" (1599). His outspoken views and notorious private life led to his being accused of atheism, blasphemy and homosexuality. He was allegedly involved in criminal activities on more than one occasion and eventually murdered in a Deptford tavern, possibly as a result of his involvement in espionage, but more probably as a consequence of a dispute over the bill.

The University Wits

"The University Wits" is the name given to the group of writers particularly responsible for the rapid rise of Elizabethan drama as the pre-eminent cultural form of the day during the last two decades of the sixteenth century, but also notable for their achievements in prose. Their plays includes Robert Greene's *Friar Bacon and Friar Bungay* (1589) and George Peele's *The Old Wives' Tale* (1595). Their prose works include John Lyly's romances *Euphues: The Anatomy of Wit* (1578) and *Euphues and His England* (1580) and Thomas Nashe's picaresque *The Unfortunate Traveller* (1594). *The Spanish Tragedy* (1592) by Thomas Kyd, another highly popular play of the late sixteenth century, anticipates Jacobean tragedy in its extensive use of violence and themes of madness and revenge.

Francis Bacon (1551–1626)

One of the leading public figures of the day, Bacon held the offices of Solicitor-General, Attorney-General, Lord Keeper of the Seal and Lord Chancellor of England, before falling from office in disgrace in 1621. He was the central English figure in the movement away from the Scholasticism of the medieval clerics, the dominant intellectual tradition at the beginning of his life, towards the Humanism that came to be seen as the embodiment of the Renaissance spirit. In *The Advancement of Learning* (1605) and *Novum Organum* (1620), he argued for a new spirit of empirical scientific inquiry that would be the scholarly equivalent of the great Elizabethan voyages of discovery.

His other works include the unfinished utopian fiction *The New Atlantis* (1627), in which a group of English sailors discover a Pacific island, where a college of sciences that can be seen as a blueprint for the Royal Society (subsequently founded in England in 1660) flourishes. Some commentators who have cast doubts on Shakespeare's authorship of his plays have asserted the claims of Bacon as a more likely author of "Shakespeare".

William Shakespeare (1564–1616)

Shakespeare's Life

Comparatively little is known about the life of England's greatest dramatist. He was born in Stratford-upon-Avon in 1564, probably educated at the local grammar school and in 1582 married Anne Hathaway, who bore him three children: a daughter, Susanna, and the twins Judith and Hamnet, who died at the age of eleven. Some time between the years 1585 and 1592, Shakespeare left Stratford and pursued a career as an actor and dramatist in London. After initially struggling to establish himself, he became a founder member of one of the leading theatrical companies of the day, the Lord Chamberlain's Men, in 1594 and by the mid-1590s his reputation as the period's leading playwright was assured. His greatest works belong to the latter part of this decade and the first years of the seventeenth century. Many were first performed at the Globe Theatre, built on the south bank of the Thames in 1599, in which Shakespeare was a shareholder. Somewhere around 1613, when the Globe burned down, he appears to have left London and spent the last years of his life in Stratford, where he died and was buried in 1616. The posthumous collection of his plays in the First Folio of 1623 ensured their preservation for posterity, though many also exist in earlier quarto editions. The evidence for precise dating of his plays is often slim. Here they are grouped by period or genre.

Early Plays: 1590–95

Shakespeare's first plays offer glimpses of his later genius, but are frequently indistinguishable from the work of his dramatic contemporaries. The first of the three parts of *Henry VI* is of uncertain authorship, but the plays are among Shakespeare's earliest dramatic work. *Richard III*, a more accomplished history play with a memorable hero-villain, is often grouped with them.

Shakespeare's early comedies frequently take their subjects from classical drama and are heavily reliant on farce and situational humour, often built around disguise, mistakes and trickery. They include *The Comedy of Errors, The Taming of the Shrew* and *The Two Gentlemen of Verona. Love's Labour's Lost* is a virtuoso satire of inflated language, such as that used in Lyly's *Euphues*, though Shakespeare displays an obvious relish for the wordplay and linguistic excess that are the ostensible objects of his irony.

He also wrote two tragedies during this period. Popular in its own day, *Titus Andronicus*, which has much in common with a play such as Kyd's *Spanish Tragedy* in its use of violence, madness and revenge, is probably Shakespeare's earliest tragedy. *Romeo and Juliet*, the legendary story of the "star-cross'd lovers" who become victims of their feuding Verona families' enmity towards one another, is a more carefully plotted and moving work, which has retained its popularity across the centuries.

History Plays and Roman Plays: 1595–1608

While they ostensibly deal with subject-matter from England's past, Shakespeare's history plays often have an allegorical relevance to Tudor debates about the Constitution and good government. So too do his Roman plays. After the three parts of *Henry VI* and *Richard III*, Shakespeare wrote a second tetralogy of history plays (1595–99). This begins with *Richard II*, a tragic study of a monarch who, like Marlow's *Edward II*, proves unsuited to kingship. The poetic dreamer, Richard, loses his throne to his more pragmatic cousin, Bolingbroke, who becomes Henry IV in the next two plays of the tetralogy. *Henry IV*, Parts I and II are, however, as much concerned with the coming of age of Henry's son, Prince Hal, the future Henry V, as with his own struggles to put down rebellions.

The two plays are also notable for one of Shakespeare's richest comic creations, Falstaff, a larger-than-life character who has affinities with the medieval Lord of Misrule figure, but whose complexity frustrates easy labels. Initially, Prince Hal enjoys Falstaff's convivial company, but when he becomes king at the end of the second part, he disowns him, in a scene which some commentators feel demonstrates his hard-heartedness, in order to assume the duties of his role. In *Henry V*, he takes on the mantle of England's military leader in battles against the French and the play has remained popular as a celebration of nationalism. Falstaff reappears in the comedy *The Merry Wives of Windsor* (*c.* 1600), allegedly revived at Queen Elizabeth's request.

Shakespeare's histories also include the less highly regarded *King John* (*c.* 1596) and parts of *Henry VIII* (*c.* 1612), which was probably a collaboration with John Fletcher.

The Roman plays, *Julius Caesar*, *Antony and Cleopatra* and *Coriolanus*, belong to the years 1599–1608. Like the history plays, *Julius Caesar* has obvious relevance to contemporary debates about government. When Caesar is assassinated, the motivation of his killers is complex. The integrity of their leader Brutus, "the noblest Roman of them all", is never seriously questioned, though the actions taken to avenge Caesar by Mark Anthony, whose oration over his dead body is an outstanding example of persuasive political rhetoric, are also presented sympathetically. In *Antony and Cleopatra*, Antony is torn between the Roman values of reason and political calculation and Cleopatra's Egyptian world of obsessive passion. His love for Cleopatra leads to his neglect of duty, with tragic consequences for both protagonists. *Cymbeline* depicts the tragedy of a Roman hero destroyed by his pride and haughty aloofness from the people.

Comedies: 1595–1600

Shakespeare's most famous comedies, *Much Ado About Nothing*, *As You Like It* and *Twelfth Night*, belong to his middle period (1598–1600). They were preceded by *A Midsummer Night's Dream* (1595–6), a comic fantasy in which a group of rustics stage their version of a tragic love story, with hilarious consequences. The rustics' play is, however, located in a world where serious romantic values have been turned upside down for a single night by fairies. The middle comedies use idealized settings and romantic plots and move between broad humour and a more serious examination of male-female relationships and social attitudes. *Much Ado About Nothing* includes one of Shakespeare's most memorable couples, Beatrice and Benedick, whose verbal sparring makes their relationship much more dramatically animated than that of the play's more conventional romantic lovers, Claudio and Hero.

Twelfth Night contrasts the values of "cakes and ale" with a more Puritanical approach to social conduct that had come to characterize areas of Elizabethan life. The middle comedies make extensive use of disguise, pretence and mistaken identity. These elements are both a source of humour and a basis for a probing investigation of issues of identity.

The Great Tragedies: 1600–06

Shakespeare's most famous tragedies, *Hamlet*, *Othello*, *King Lear* and *Macbeth*, were written in the early years of the seventeenth century. They are generally regarded as his greatest achievement, containing some of his finest dramatic verse and exploring the ambiguities of human behaviour through a focus on the forces that lead to the downfall of their essentially noble male protagonists.

The plays have generally, though not always, been viewed as tragedies of character rather than fate and each of the heroes has weaknesses that cause his tragedy. Thus the undoing of Othello, a Moorish general in the service of the Venetian Republic, has frequently been attributed to his jealousy and his malleability in the hands of the villain, Iago. However, from another point of view his tragedy can be seen as that of a racial outsider in a European society, which respects his professional abilities but is less generous towards him when he marries a senator's daughter. In a play that can be seen as a companion-piece to this aspect of *Othello*, the tragic-comic *Merchant of Venice* (1596–7), the Jewish moneylender Shylock is also denied the same basic human rights as other Venetians, though he is less sympathetically portrayed than Othello. Hamlet's tragedy has been ascribed to numerous causes, among them his inability to move from introspection to action and his Oedipal love for his mother. Macbeth, a killer-poet who becomes king after murdering those who stand in his way, can be seen as a later version of Richard III. Egged on by his wife, Shakespeare's most compelling female villain, he becomes a personification of the dictum that power corrupts. Shakespeare's most wide-ranging tragedy, *King Lear*, focuses on an ageing protagonist whose lack of self-knowledge prevents him from distinguishing between the hypocrisy of his two elder daughters and the sincerity and love of his youngest. Towards the end of the play, in a movement which anticipates the mood of Shakespeare's late romances, he learns the truth, but only when he is dying as a "foolish fond old man". *Lear* is, however, more than simply a tragedy of character; it also depicts human beings as the "sport" of the gods, powerless to resist the forces of fate.

Problem Plays: 1601–05

All's Well That Ends Well, *Measure for Measure* and *Troilus and Cressida* have generally been referred to as Shakespeare's "problem plays". They were written around the same time as the great tragedies and have also been called "bitter comedies".

The three plays are problematic, not only because of the difficulty of classifying them as a particular form of drama, such as tragedy or comedy, but also because of their complex treatment of moral questions, which are frequently left unresolved. The troubling treatment of sexuality and politics in *Measure for Measure* has increased its popularity in recent decades and it has been seen to have considerable contemporary relevance. *Two Noble Kinsmen* (*c.* 1613), to which Shakespeare probably contributed, in which case it was his last dramatic work, has also been classified as a problem play.

The Late Romances: 1609–11

In his three late plays, *Cymbeline*, *The Winter's Tale* and *The Tempest*, Shakespeare subsumes tragedy in a larger vision of reconciliation and regeneration, a mood anticipated by a play such as *King Lear*, where the tragic consequences of actions still prove inescapable. Sometimes styled "tragic-comedies", the late romances create a form of drama that is uniquely their own, flouting many of the conventions of both classical and contemporary theatre in the process.

In each of the plays, the protagonist has to come to terms with a sin or omission and manages to do so through the agency of his daughter. *The Tempest*, usually seen as Shakespeare's final dramatic statement, is a particularly enigmatic play, which contains some of his finest poetry. It has been variously interpreted as an allegory of New World colonialism, in which Shakespeare was clearly interested, as a fable about the artistic neglect of worldly responsibilities and as a dramatic treatment of the pastoral contrast between primitive innocence and cultivated experience, which moves beyond a simple opposition between utopian nature and corrupt nurture. The play ends with the magician, Prospero, relinquishing his right to conjure up spirits and declaring "Now my charms are all o'erthrown,/ And what strength I have's mine own", an utterance which has been related to Shakespeare himself, who also appears to be forsaking *his* "art to enchant".

Shakespeare's Poetry

In addition to the plays, Shakespeare also produced a considerable body of non-dramatic verse, including two poems inspired by Ovid: the mythological erotic poem, *Venus and Adonis* (1593), which was his most popular work in his own life-time; and *The Rape of Lucrece* (1594), a narrative poem notable for its portrayal of the protagonist's psychological conflict. Shorter verse ascribed to Shakespeare includes contributions to *The Passionate Pilgrim* (1599), a collection published under his name, the metaphysical poem, "The Phoenix and the Turtle" (1601) and "A Lover's Complaint" (1609).

Shakespeare's *Sonnets* (1609) are his finest achievement in non-dramatic verse. They comprise 154 love poems, probably written between 1592 and 1598, in the fourteen-line verse-form that had been imported into England from Italy. Shakespeare reinvented the form, using the rhyme-scheme ababcdcdefefgg and thus establishing what has become known as the Shakespearean sonnet. The *Sonnets* fall into three main sequences: poems addressed to a young man, a "dark lady" and a rival poet. Sonnets 18 ("Shall I compare thee to a summer's day?") and 130 ("My mistress' eyes are nothing like the sun") are among the most quoted.

SEVENTEENTH-CENTURY LITERATURE

Jacobean Drama

Strictly speaking, "Jacobean drama" refers to plays produced during the reign of James I (1603–25), but the term is used more broadly to describe the theatre of the early seventeenth century, in which the expansionist mood of the Elizabethan age gave way to a more sombre and pessimistic vision, characteristic of the new era.

James came to the throne with the reputation of being a believer in witchcraft, which he had written about in his *Daemonologie* (1597); Robert Burton's *Anatomy of Melancholy* (*c.* 1621) provided a quasi-scientific classification of various forms of depression; tragedies, full of violence, cynicism and intrigue, captured the mood of Jacobean gloom; and John Marston's tragic-comedy, *The Malcontent* (1604), written in collaboration with John Webster, created the quintessential stage figure of the age, that of the malcontent or cynical outsider. The malcontent also appeared in the character of Bosola in Webster's *Duchess of Malfi* (1623) and even Hamlet can be seen as an early version of the type.

John Webster (*c.*1580–*c.*1632) and John Ford (1586–*c.* 1640)

Despite their reputation for unrelieved cynicism and gloom, vigorous language lends the best Jacobean tragedies as much dramatic energy as their more optimistic Elizabethan forerunners. The most famous tragic playwrights of the period were John Webster and John Ford. Webster's *The White Devil* (1612) and *The Duchess of Malfi* are revenge plays based on historical events with Italian settings. Centred on the political and personal intrigue popularly associated with Renaissance Italy, they achieve their effect through dramatically powerful individual scenes and set-pieces, in which murders, sensational violence, madness and destructive passion loom large.

Ford's best-known plays, *The Broken Heart* (1633) and *'Tis Pity She's a Whore* (1633) place as much emphasis on pathos as tragedy. In *'Tis Pity*, the plot centres on the tragic love of a brother and sister, but the play goes beyond the sensationalism of the incest theme through its use of moving verse and imagery. Other outstanding tragedies of the period include Cyril Tourneur's *Revenger's Tragedy* (1607) and Thomas Middleton and William Rowley's masterpiece *The Changeling* (*c.* 1622).

Ben Jonson (1572–1637)

Jonson was the leading comic dramatist of the period. His plays *Every Man in his Humour* (1598) and *Every Man out of his Humour* (1599) were first performed in the Elizabethan era, but his best-known work belongs to the Jacobean age, during which he enjoyed royal patronage and wrote a number of court masques with scenery designed by the famous architect Inigo Jones. He is noted for his *Comedy of Humours*, in which particular characters represent an aspect, or Humour, of humanity. Based on early medical beliefs about the forces that determine character (blood, phlegm, melancholy and choler), this approach can be seen as the basis for the type-characters of Restoration Comedy and of later novelists such as Henry Fielding and Charles Dickens.

Jonson's major plays are *Volpone or the Fox* (1605–6), which despite its Venetian setting is generally viewed as a satire on the emergent London merchant classes; and *Epicene, or, The Silent Woman* (1609), *The Alchemist* (1610) and *Bartholomew Fair* (1614), in each of which trickery is an impetus for the action. Jonson also wrote a body of non-dramatic verse, which includes *Epigrams* (1616), *The Forest* (1616) and *The Underwood* (1640), and the tragedy *Sejanus* (1603). The circle of poets who wrote under his influence were known as "the tribe of Ben". They include Robert Herrick, Richard Lovelace and Sir John Suckling.

Francis Beaumont's *The Knight of the Burning Pestle* (1607) is a satire of aspects of contemporary taste, which employs the form of a play-within-a-play. A grocer interrupts the frame-play, "The London Merchant", to insist that his apprentice be given a part. This wish is granted and the apprentice's subsequent appearance as a grocer-errant pokes fun at both middle-class cultural aspirations and chivalric conventions.

The Metaphysical Poets

"Metaphysical" is the term generally used to classify a number of seventeenth-century poets, including John Donne, George Herbert, Andrew Marvell, Thomas Carew, Thomas Traherne, Richard Crashaw, Henry Vaughan and Abraham Cowley. These poets have been called "metaphysical", because of their use of elaborate conceits (metaphors, similes and other forms of imagery) and paradoxes. However, this is only one aspect of their primarily lyric verse technique and there are as many differences between them as there are similarities.

Recent attempts to replace the "metaphysical" label have included calling the poets "the School of Donne" and "the Fantasticks", but these are only marginally more useful terms, particularly since the poets had little sense of themselves as a group. The most famous of all metaphysical conceits is John Donne's comparison, in his poem "A Valediction Forbidding Mourning", of two lovers to the twin points of a compass: the suggestion is that however far they may stray from one another, the lovers remained linked. Other metaphysical images are drawn from cartography, science, Scripture and medicine.

The term "metaphysical" originated in the early seventeenth century with William Drummond, who used it in a censorious way to attack those of his poetic contemporaries who used metaphysical ideas. Towards the end of the century, John Dryden criticized Donne by saying "He affects the metaphysics in his amorous verses . . . where nature only should reign".

In the eighteenth century, writing from a neo-classical point of view, founded on a belief in the commonality of human experience, Samuel Johnson attacked the poets' use of extravagant and highly specialized imagery as "a kind of *discordia concors*", in which "the most heterogeneous ideas are yoked by violence together". Johnson's attack contributed to the decline of the poets' reputation. This lasted until an influential 1921 review by T.S. Eliot helped rehabilitate the poets and reclaim "metaphysical" from being a term of abuse. Eliot praised the "metaphysicals" for their "direct sensuous apprehension of thought" and "recreation of thought into feeling", qualities that had been denied them by commentators such as Johnson.

John Donne (1572–1631)

Donne's work can be divided into two main categories: the secular love poetry of his "Songs and Sonnets"; and a body of devotional writing, which includes his "Holy Sonnets" and sermons, that was mainly written in the later part of his life, after he was ordained into the Anglican Church in 1615. He became Dean of St. Paul's in 1621 and was famed as one of the finest preachers of his age. It is, however, mistaken to draw a sharp distinction between the secular and spiritual aspects of Donne's writing.

An attempt to spiritualise the carnal side of his nature characterizes much of his amorous verse and his work is surprisingly modern in the openness and psychological complexity of its treatment of sexual passion. His divine poetry moves in the opposite direction, frequently using physically direct language in spiritual contexts, as when he asks God to ravish his soul. It often expresses doubt, not about Christian doctrine, but about whether the poet himself, as a particular sinner, will be saved from damnation.

Donne's complex metaphysical imagery is tempered by a conversational directness rare among his poetic predecessors and, since the rehabilitation of the metaphysical poets in the early twentieth century, his poetry has been viewed as particularly modern. His most famous love poems include "The Ecstasy", "The Canonization", "The Sun Rising", "The Good Morrow", "The Flea", "A Valediction Forbidding Mourning" and "Go and Catch a Falling Star". His religious writing includes his sonnet to death ("Death be not proud"), his "Hymn to God the Father" and his Meditation 12, from which the phrases "No man is an island" and "Do not ask for whom the bell tolls, it tolls for thee" have passed into the language. Donne also produced numerous epigrams, elegies and some early satirical verse.

George Herbert (1593–1633)

Like Donne's, Herbert's poetry demonstrates metrical variety, conversational directness and a highly imaginative use of conceits. It is, however, more consistently devotional than Donne's. Most of Herbert's work appeared in *The Temple* (1633), a poetic testament in which the various parts are intricately arranged to provide a moving and multifaceted expression of his Christian faith. It deals with the immature soul's progression towards salvation through immersion in central aspects of Christian belief, including the resurrection, the importance of the sacraments and the need for communal worship.

Herbert is particularly remembered for his two pattern-poems, "The Altar" and "Easter Wings", where the shape of the poem as it appears on the page mirrors its subject, but these are his only poems of this kind. "The Collar" and "Jordan", I and II, are among his other best-known poems. His elder brother, Edward, Lord Herbert of Cherbury, was also a notable metaphysical poet.

Andrew Marvell (1621–78)

Marvell lived through the turbulent years of England's Civil War, occupying a number of political offices, including that of MP for Hull for nearly twenty years. His poetry exhibits a range of styles that both reflect the political vicissitudes of the period and his remarkable personal capacity to capture different moods. Although he excelled as a writer of witty metaphysical verse, his most lasting achievement is his lyric poetry, which includes one of the greatest English love poems, "To His Coy Mistress". His long poem, "Upon Appleton House", which was dedicated to the parliamentarian general, Sir Thomas Fairfax, celebrates the virtues of the rural country house as a retreat from the schisms of seventeenth-century life.

Marvell's capacity to balance opposed perspectives with a judiciousness rare in the period is seen at its best in his "Horatian Ode upon Cromwell's Return from Ireland", which carefully distributes its sympathies between Charles I and the avowed subject of the ode, Cromwell. Marvell was John Milton's assistant during the last years of the Commonwealth period (1657-60) and is credited with having intervened to save Milton from imprisonment and possible execution at the time of the Restoration. In his later years, he deserted the lyric for panegyrics and satires concerned with public issues.

Women Writers of the Seventeenth Century

While seventeenth-century public life was largely the preserve of men and few women writers were published in their own lifetime, recent research has directed attention to the very significant literary achievements of the female authors of the period. Lady Mary Wroth's prose romance *Urania* (1621) achieved a degree of contemporary notoriety through its treatment of court scandals. Today it is more interesting as an early feminist classic. It tells the stories of several women in unhappy marriages or relationships and in search of identities that are independent of men. Margaret Cavendish, Duchess of Newcastle, apologised for her "audacity in writing at all, being a woman", but nevertheless produced twenty-two works in a range of genres, including *Poems and Fancies* (1653) and *The Description of a New World called the Blazing World* (1666), an early science-fiction romance. Dorothy Osborne is noted for a volume of just seventy-seven letters, mainly written to her future husband, Sir William Temple, Jonathan Swift's patron, between 1652 and 1654. Collectively, the letters form a miniature masterpiece that provides a vivid insight into upper-class seventeenth-century domestic life and the writer's own introspective psyche. The prolific Aphra Behn wrote the short novel *Oroonoko, or The Royal Slave* (1688), about an African-born prince, who leads an unsuccessful slave rebellion in Surinam, and numerous dramatic comedies (*see later*).

Restoration Drama

In 1642, when Cromwell and his Puritan supporters, who believed that acting was an immoral pursuit, gained control of Parliament, the London theatres were closed. They did not reopen until the accession of Charles II in 1660. The drama of the next forty years is generally called "Restoration Drama", though there are considerable differences between plays produced in the early part of the period and those staged in the closing decades of the seventeenth century. Comedy was the dominant form of the era, though heroic plays such as Dryden's *Aureng-Zebe* (1676) and his retelling of the Antony and Cleopatra story, *All for Love* (1678), and Thomas Otway's *Venice Preserved* (1682) also made a distinctive contribution to the development of the English theatre of the period.

Restoration Comedy is notable for its use of type-characters, in the tradition of Ben Jonson's *Comedy of Humours* (*see* **M9**). Such types include foppish noblemen, witty young women, rakes, cuckolds, promiscuous wives, country gentlemen and scheming servants. The early comedies of the period reacted against Puritan prudery by depicting cynically amoral upper-class relationships, employing plots centred on sexual and financial intrigues and making extensive use of wit, bawdy and innuendo.

Their attitude to gender relations has sometimes been seen as a reflection of the debauchery of the aristocratic society of Charles II's court. William Wycherley's *The Country Wife* (1675), in which a countrywoman newly arrived in London quickly becomes adept in the licentious ways of the capital, is one of the finest examples of this phase of Restoration Comedy. Wycherley's other plays include *The Plain Dealer* (1676).

Wit continues to be a staple of the later plays, but a subtler Comedy of Manners replaces the broad humour of the earlier drama. In William Congreve's *The Way of the World* (1700), the culminating achievement of Restoration comedy, courtship and marriage remain central concerns, but they are explored through a more questioning and sensitive use of witty repartee. Congreve's other comedies include *The Double Dealer* (1693) and *Love for Love* (1695). *The Way of the World* was written in the wake of the Anglican clergyman, Jeremy Collier's *Short View of the Immorality and the Profaneness of the English Stage* (1698), which played a significant part in changing attitudes towards theatrical propriety and decency. Early eighteenth-century comedy was to desert the broad humour of the Restoration play for more sentimental comedy.

Other Restoration Dramatists

Other notable Restoration dramatists include George Etherege, author of *The Man of Mode* (1676), the famous architect Sir John Vanbrugh, who wrote *The Relapse* (1696) and Thomas Southerne, author of *The Wives' Excuse* (1691), which exposes the effects of the sexual hypocrisy of the period on women. In Shakespeare's plays, female roles had been played by boys; in Restoration comedy women's parts were now taken by actresses, one of whom was Charles II's mistress, Nell Gwyn.

The period also saw the emergence of a professional woman dramatist, Aphra Behn, whose plays, which include *The Rover* (1677), *The City Heiress* (1682) and *The Lucky Chance* (1686), offer a more serious investigation of gender relations than can be found in most, if not all, of her male contemporaries. Behn's novel *Oroonoko* (*see above*) was dramatized by Southerne in a version first performed in 1695.

John Bunyan (1628–88)

Best-known for *The Pilgrim's Progress*, which remained the most widely read book in the English language, after the Authorized Version of the Bible, until the twentieth century, Bunyan wrote in a plain prose style that anticipates the novel. His first major work, *Grace Abounding to the Chief of Sinners* (1666), describes its author's conversion from a wicked early life and his subsequent call to the ministry. Typical of the Puritan spiritual autobiography of the period, it is a homiletic work, providing an example for others to follow, and has little in common with autobiographies which stress the subject's individuality.

Bunyan spent two periods in Bedford jail (1660–72 and 1675) for unlicensed preaching at a time when divine services could only be conducted according to the forms of the Church of England. He is believed to have written most of the first part of *Pilgrim's Progress* (1678) during his second period of imprisonment. It is a dream allegory which tells the story of an Everyman figure, Christian's journey from the City of Destruction to the Celestial City through such landscapes as the Slough of Despond, the Valley of the Shadow of Death, Doubting Castle and the country of Beulah.

This is a "progress" which enacts the individual soul's journey to salvation. Travelling through these varied and difficult surroundings, Christian meets allegorical figures such as Worldly Wiseman, Hopeful and Giant Despair, who represent aspects of both his own character and of contemporary seventeenth-century life. Bunyan's simple, realistic prose has a Biblical quality. Though Christian moves through allegorical terrain, commentators have commented on Bunyan's realism and noted that the contours of his spiritual landscapes resemble those of his native Bedfordshire.

In the second part of *Pilgrim's Progress* (1684), Christian's wife, Christiana, follows in his footsteps, but her journey to heaven is less arduous than his, particularly since she receives more support along the way. This shift in emphasis may reflect Bunyan's desire to focus on the importance of community in the Christian struggle. His other major works, *The Life and Death of Mr Badman* (1680) and *The Holy War* (1682), are also religious allegories.

John Milton (1608–74)

England's greatest epic poet and one of its literature's most extraordinary polymaths, Milton was a Puritan who initially seems to have been drawn to a clerical career, but instead pursued his Christian beliefs and political convictions through the medium of literary works that linked Classical and Christian learning. He suffered from failing eyesight during the 1640s and was completely blind from 1652. The date of his famous "Sonnet on His Blindness" is uncertain, but it probably belongs to the mid-1650s. During the interregnum period he held office as Latin Secretary to the Council of State. In 1660 he published a revised edition of his *Ready and Easy Way to Establish a Free Commonwealth* (1659), a principled if imprudent argument for republicanism at a time when the monarchy was being restored. He was briefly jailed, but escaped a longer period of imprisonment, or possible execution. His masterpiece, the epic *Paradise Lost* (1667), which was probably begun before the Restoration, its sequel, *Paradise Regained* (1671) and his "Greek" tragedy, *Samson Agonistes* (1671), were products of his later years.

Milton's Early Works

Milton's early works include: "Ode upon the Morning of Christ's Nativity" (1629), the masque *Comus* (1637) and "L'Allegro" and "Il Penseroso" (1645; written *c.* 1631), a complementary pair of poems in octosyllabic couplets, which respectively illustrate the qualities of the happy, outgoing man and the melancholy, contemplative man. "Lycidas" (1637), a response to the drowning of Milton's Cambridge contemporary, Edward King, is one of the great English elegies. It expands from being a meditation on a premature individual death into a moving reflection on the transience of human life and the poet's own uncertainties about his personal future, before concluding with an expression of faith in the immortality of the soul. In the 1640s, Milton produced numerous prose pamphlets, including *The Doctrine and Discipline of Divorce* (1643), written shortly after his first wife, Mary, had left him a few weeks after their marriage, and *Areopagitica* (1644), a famous, early defence of the freedom of the press.

Milton's Masterpiece

Paradise Lost is written in blank verse and employs many of the conventions of the Greek and Latin epics, including elevated language, a heroic theme, breadth of scope, the Invocation to the Muse (in this case the Greek muse of astronomy, Urania, now transformed into a Christian) and epic similes. The poem's declared purpose is "to justify the ways of God to men", but many critics have seen Milton's Satan as the greatest creation of the poem and taken the view that his use of classical heroic models is at odds with the avowed Christian message of the poem. The most famous expression of this viewpoint is the Romantic poet William Blake's contention that Milton was "a true poet and of the Devil's party without knowing it". If one agrees with such a reading, it lends support to the view that Milton's republican response to the political situation of his day led him, consciously or unconsciously, to adopt a revolutionary attitude to authority, as represented by God in the poem.

However, although the first two books of *Paradise Lost* depict Satan in heroic terms, its later sections are more centrally concerned with its avowed subject, "man's first disobedience, and the fruit/ of that forbidden tree". They tell the story of Adam and Eve's expulsion from the garden of Eden in a lofty and dignified style which expands outwards from its ostensible subject to provide an encyclopaedic view of human history from a Christian point of view.

Two Diarists: Pepys and Evelyn

The Restoration period is also notable for the work of the two most famous English diarists. The diaries of the naval administrator Samuel Pepys (1633–1703) provide a vivid picture of London life from 1660 to 1669, including accounts of events such as the Coronation of Charles II, the Plague and the Fire of London, as well as demonstrating Pepys's own idiosyncrasies and vanity. His fascination with details and flair for chronicling them makes his writing one of the most illuminating records of the age. The memoirs of his friend, John Evelyn (1620-1706), are less spontaneous, but only slightly less colourful. Beginning rather earlier, they span a longer period, detailing Evelyn's more considered impressions of events from 1657, when Cromwell was offered the Crown, to the Glorious Revolution of 1688.

John Dryden (1631–1700)

Dryden is the quintessential writer of the late seventeenth century, a man who managed to retain royal favour through many of the political changes of the period, as well as producing major work in most of the dominant literary forms of the age. He became Poet Laureate in 1668 and kept this position after converting to Catholicism, when James II succeeded to the throne in 1685. It was only on the accession of William and Mary that he lost the patronage he had enjoyed for more than twenty years. Beginning with *Astraea Redux* (1660), a panegyric celebrating the restoration of the Stuart monarchy, he responded to many of the major public events of the next three decades. *Annus Mirabilis* (1667) demonstrates a similar royalist vision in its treatment of the Dutch War of 1665–6 and the Fire of London. Because of his ability to adapt to different regimes, he has variously been seen as an opportunist and as a man who had the mental flexibility to avoid being compromised by taking up intransigent positions.

The Achievements of Dryden

Dryden was the first great English master of the heroic couplet (rhymed iambic pentameters) and he anticipated Alexander Pope's perfection of this verse form as a vehicle for satire. As a poet, he is best known for his satires. These include *Absalom and Achitophel* (1681; Part II, mainly by Nahum Tate, 1682), an allegory which uses an Old Testament parallel to attack the attempt by the Earl of Shaftesbury and the Duke of Monmouth to replace James, Duke of York as Charles II's heir; and his richest comic work *MacFlecknoe* (1682), a mock heroic poem, lambasting the dramatist Thomas Shadwell and bad art more generally. Dryden also wrote a number of fine Pindaric odes, including "A Song for St Cecilia's Day" (1687) and "Alexander's Feast; or, The Power of Music" (1697), and the didactic religious allegories, *Religio Laici* (1682) and *The Hind and the Panther* (1687). The former defended Anglicanism; the latter Catholicism. His work as a dramatist includes the blank verse heroic plays *All for Love* (*see above*) and *The Conquest of Granada* (1670), which was famously parodied in Buckingham's burlesque play *The Rehearsal* (1671), and a number of tragic-comedies, among them *Marriage à la Mode* (1672).

Dryden is often considered the first major English literary theorist. His *Essay of Dramatick Poesie* (1668) discusses the merits of various forms of drama and justifies his own practice as a dramatist; his *Discourse concerning the Original and Progress of Satire* (1693) examines the appropriateness of the methods of Horace and Juvenal for English satirists and in so doing established the groundwork for one of the key debates of the next century, when Pope produced imitations of Horace and Johnson preferred the model of Juvenal. Dryden was also one of the leading translators of his age, producing an especially fine translation of Virgil's *Aeneid* (1697).

His final work, *Fables, Ancient and Modern* (1700), included translations of Homer, Boccaccio and Chaucer.

John Wilmot, Earl of Rochester (1647–80)

Rochester's dissolute aristocratic life-style has led to his being seen as a representative figure of the Restoration period. He was famed as a libertine, drinker and poseur. His verse was noted for its sexual explicitness and poems such as " A Ramble in St. James's Park" enjoyed an underground reputation as pornographic classics. However, Rochester's poetry also has a serious and reflective side and he is one of the first masters of Augustan satirical verse. His most famous poem, "A Satire against Reason and Mankind" (1675), explores tensions between rationalism and sensuality. Rochester also wrote some fine lyric poetry and introduced the form of the classical "imitation" into English verse.

THE EIGHTEENTH-CENTURY NOVEL

Daniel Defoe (1660–1731)

Defoe is generally considered the first great English novelist, since his work is written with a degree of circumstantial realism unprecedented in earlier English prose fiction. He was nearing sixty years of age when his first novel *Robinson Crusoe* (1719) was published. Prior to this he had led an eventful life as a journalist, businessman and political writer, whose publications had included *The True-Born Englishman* (1701), a satirical work praising William III and defending religious minorities, and *The Shortest Way with the Dissenters* (1702), which mocked Anglican intolerance of nonconformists.

The Original Desert Island Novel

The original desert island novel, *Robinson Crusoe* has been interpreted in numerous ways: as a romantic adventure story; as a spiritual autobiography, a secular equivalent of Bunyan's *Grace Abounding*; as an economic success-story that offers a blueprint for capitalism; as one of the modern world's first great do-it-yourself manuals, an account of survival without the usual props of civilization; and, since it is set in the Caribbean, as a narrative of New World utopianism. It was followed by sequels detailing Crusoe's *Farther Adventures* (1719) and *Serious Reflections* (1720) and six other novels, of which *Moll Flanders* (1722) is the best known. Like *Robinson Crusoe*, the novel, which charts Moll's rogue's progress through English society, has also been viewed as both a spiritual autobiography and an economic success-story, though its setting within society makes it superficially very different and finally it is difficult to take the putative religious elements seriously. Nevertheless it offers a striking portrait of the exploits of a woman who has to live by her wits in order to make her way in society and whose situation justifies her resorting to picaroon cunning in the eyes of many readers.

Roxana (1724) tells a similar story of wickedness and repentance, though the penitence is more perfunctory. Defoe's other novels were *Captain Singleton* (1720), *Memoirs of a Cavalier* (1720), *Colonel Jack* (1722) and *A Journal of the Plague Year* (1722), which made extensive use of documentary records of the 1665 London Plague. In his later years he published the three-volume *A Tour through the Whole Island of Great Britain* (1724–6) and *The Complete English Tradesman* (1725–7).

Samuel Richardson (1689–1761)

Richardson was a middle-aged printer, who became an overnight celebrity when his epistolary novel *Pamela, or Virtue Rewarded* appeared in 1740. Originally conceived as "a series of familiar letters" for "country readers ... unable to indite for themselves", it tells the story of a servant girl who defends her virginity against the advances of her aristocratic master and eventually wins his hand in marriage. The novel established a plot pattern that would become one of the staples of English romantic fiction: the vicissitudes in the relationship between a woman and a man who is her social superior. The first section of *Pamela* is notable for skilful use of the epistolary form for dramatic effect. However, when the letters give way to a journal, much of this immediacy is lost. The second part (1741) depicts Pamela's adaptation to her new social rank and the ways in which she handles her husband's transgressions.

Richardson's Masterpiece

Richardson's masterpiece *Clarissa* (1747–8), originally published in seven volumes and one of the longest novels in the English language, also focuses on the figure of a threatened heroine, this time a woman of higher social rank. Its use of the epistolary form is altogether more complex than that of *Pamela*, with the letters being shared between four main correspondents; and the representation of moral issues and sexual conflict is also more probing and disturbing than in the earlier novel. Clarissa is another personification of virtue, but she is secretly fascinated by the rakish male protagonist, Lovelace, who eventually rapes her. Lovelace, in turn, is one of the most powerfully drawn characters in early English fiction: his struggle to balance his sexual urges with his respect for the virtuous Clarissa demonstrates a psychological complexity that is at variance with the ostensible simplism of Richardson's avowed morality and the tragic outcome can be seen as an indictment of eighteenth-century gender roles.

Richardson also published *Sir Charles Grandison* (1753–4), in which he switched his main focus to the portrayal of male virtue.

Henry Fielding (1707–54)

Fielding was a leading comic dramatist until 1737, when the Licensing Act, generally considered to have been introduced in response to his attacks on the Whig government of the day, imposed censorship on stage performances and put an end to his career as a playwright. He became a reforming magistrate and, along with his brother John, founded Britain's first police force, the Bow Street Runners.

His First Novels

Fielding's career as a novelist began as a response to what he viewed as the hypocrisy and prurience of Richardson's *Pamela*. In his anonymously published parody, *Shamela* (1741), the unprincipled heroine is a whore and trickster, who schemes to entrap her master into marriage. Fielding's first major novel, *Joseph Andrews* (1742), also took its initial inspiration from *Pamela*. In the opening sections, he reversed gender roles to show male virtue, personified by Pamela's brother Joseph, under attack from predatory females. However, parody is discarded in the main part of the novel, where Joseph undertakes a picaresque journey through the countryside with the book's most memorable figure, the Quixotic clergyman Parson Adams. The episodic format of the journey affords Fielding numerous opportunities to engineer comic situations. At the same time, particularly through the character of Adams, he dramatizes a very different kind of morality from Richardson's Puritanism: that of latitudinarian Anglicanism, which placed its emphasis on salvation through good deeds rather than professions of faith.

Fielding's Masterpiece

The same morality informs Fielding's masterpiece *Tom Jones* (1749), which he termed "a comic epic in prose". More generally, the novel is a brilliantly plotted comic picaresque, which provides a panoramic overview of English life in the middle of the eighteenth century. In the central section, a journey through the countryside at the time of the Jacobite rebellion includes a wide-ranging portrait gallery of social types and a series of farcical encounters that shows the influence of Fielding's experience as a comic dramatist. This is framed by sections set in the West Country and London, which suggest that the values of the rural squirearchy are preferable to those of the genteel society of London.

The novel also propounds a sexual ethic which is in marked contrast to Richardson's conception of "virtue"; the hero Tom is excused for being unfaithful to his beloved Sophie on three occasions on the grounds that he is essentially goodhearted. In the conclusion, the revelation that the "foundling" Tom is really a gentleman secures his promotion in the social hierarchy, just as marriage elevates Pamela, though there is a significant difference in that in Fielding's world nobility remains a matter of birth, not social advancement. *Tom Jones* is also notable for the introductory chapters to its eighteen books, which discourse on a range of subjects, including the novel itself, and in so doing anticipate the self-reflexive style of Sterne's *Tristram Shandy*.

Fielding's other works include: *Jonathan Wild* (1743), an ironic novel which followed Gay's *Beggar's Opera* in attacking prominent public figures, notably the prime minister Robert Walpole, through the guise of a eulogistic account of the "greatness" of a notorious contemporary criminal; *A Journey from this World to the Next* (1743); his last novel, *Amelia* (1751), in which he deserted his customary comic mode of writing for a more Richardsonian consideration of morality in domestic life; and the posthumously published *Journal of a Voyage to Lisbon* (1755).

Tobias Smollett (1721–71)

While Defoe and Fielding had used elements from the Spanish picaresque novel in their fiction, it was the Scottish-born Smollett who became the most significant early English exponent of the genre, which he employed for satirical purposes and social comment. Prior to the publication of his first novel, *Roderick Random* (1748), he had been a surgeon's mate and the novel is particularly notable for its scenes of nautical life. *Peregrine Pickle* (1751), in which the rogue hero moves in a higher social sphere and travels in mainland Europe is often more savage in its satirical attacks and uncompromisingly graphic in its representation of physical characteristics. It was followed by *Ferdinand Count Fathom* (1753), a novel employing mock-heroic and Gothic elements to recount the adventures of its bogus "count", and *Sir Launcelot Greaves* (1760–1), chiefly remembered as an imitation of Cervantes' *Don Quixote*, which Smollett had translated into English, and as the first work by a major novelist to be serialized in a magazine.

His Finest Novel

In his last novel, *Humphry Clinker* (1771), which has generally been viewed as his finest, Smollett uses the epistolary technique to chronicle the picaresque story of a travelling expedition. His characteristically savage representation of the unsavoury and brutal aspects of eighteenth-century life gives way to a more reflective style, though the novel's delineation of a cross-section of British life still includes harsh caricatures. The story is told by a number of letter-writers, with the figure of the elderly squire, Matthew Bramble, who combines misanthropic and sentimental qualities and has sometimes been seen as a mouthpiece for Smollett's own opinions, at the centre. Smollett also published *Complete History of England* (1757–8) and *Travels through France and Italy* (1766).

Laurence Sterne (1713–68)

Like Defoe and Richardson, Sterne came to the novel comparatively late in life. A Yorkshire parson, involved in the ecclesiastical politics of the diocese of York, he, too, achieved overnight fame with the publication of his first major fiction: Volumes One and Two of his novel, *The Life and Opinions of Tristram Shandy* (1760–67), after which he found himself lionized in literary London. *Tristram Shandy* is often regarded as one of the great eccentricities of English literature. Critics such as Dr Johnson, who said, "Nothing odd will do. *Tristram Shandy* did not last long ", have been proved wrong, but Sterne's work does flout most of the conventions that had already come to be associated with the fledgling genre of the novel. An apparently uncompleted nine-volume novel, it is a fictional autobiography in which Tristram sets out to reveal everything about his life and opinions, beginning with the night of his botched conception.

He does not arrive at the moment of his birth until the third volume and the novel provides a catalogue of false starts, digressions, accidents and comic misfortunes. Despite Tristram's avowed intention to tell his story from beginning to end, it lacks linear progression (it concludes more than four years before it begins), has missing chapters and a blank page and includes very little narrative action.

As such it becomes a kind of parody of the type of fictional autobiography that Defoe writes, in which events, objects and characters are exhaustively described. Yet it succeeds brilliantly as a novel of a completely different kind—a novel about novel-writing—and the Russian formalist critic, Victor Shklovsky, who takes the view that fiction is finally about its own processes, has commented that its self-parody makes it "the most typical novel of world literature".

Sterne is also known for another whimsical, uncompleted novel, *A Sentimental Journey* (1768), which traces the sentimental adventures of its hero, Parson Yorick, in France, poking fun at the accounts of travellers such as Smollett, called Smelfungus here, as it does so. The book owed much of its contemporary appeal to its sentimentality, viewed by Yorick as a form of spontaneous benevolence that spreads outwards from particular individuals to affect all those with whom they come into contact. However, for the modern reader, it is difficult not to view Yorick's sentimental effusions ironically, particularly when they occur in the context of his prurient encounters with women.

Sterne's other writing includes his sermons, published as *The Sermons of Mr Yorick* (1760–69), and the *Journal to Eliza* (written 1767; published 1904).

The Gothic Novel

As a reaction against the neo-classical beliefs that had dominated culture early in the century, the later eighteenth century revived Gothic forms in literature and architecture, preferring to draw its inspiration from a tradition associated with the medieval rather than the classical period. Horace Walpole built his Gothic castle, Strawberry Hill, at Twickenham and wrote a pioneering Gothic novel, *The Castle of Otranto* (1764). William Beckford's *Vathek* (1786) introduced Gothic elements into another fashionable and exotic romantic form, the Oriental tale, and he built a massive Gothic folly, Fonthill Abbey in Wiltshire, which collapsed less than thirty years later. Other prominent Gothic novels of the period include Anne Radcliffe's *The Mysteries of Udolpho* (1794) and Matthew Lewis's *The Monk* (1796).

The staples of the form, on which its individual exponents worked variations, were quickly established: sensation, mystery, suspense, horror, supernatural happenings, Italian settings, Gothic architecture and persecuted heroines. William Godwin expanded its possibilities by introducing a degree of psychological subtlety that had not hitherto been characteristic of the genre into his more realistic *Caleb Williams* (1794), a novel which is also noteworthy for protesting against the mistreatment of the socially disadvantaged and as an early example of the novel of crime and detection.

The First Gothic Masterpiece

The Gothic novel produced its first undisputed masterpiece in Godwin's daughter, Mary Shelley's *Frankenstein, or the Modern Prometheus* (1818), a novel which dramatizes ethical issues concerning the right to create life with great imaginative power. While there is horror a-plenty in *Frankenstein*, its main appeal lies in the psychology of its protagonists and it is as much concerned with the mental torments of the scientist, Victor Frankenstein, who gives life to the monster for which the numerous popular spin-offs of the book are best known, as with the sufferings of the creature himself.

Other Novelists

Until comparatively recently, the achievements of eighteenth-century women novelists received much less recognition than those of their male contemporaries or their nineteenth-century female successors. Fanny Burney's novels were a notable exception: *Evelina* (1778) followed Richardson in using the epistolary form, taking a young woman's introduction into society as its main theme; *Cecilia* (1782) describes the fortunes of an heiress who is exploited by her guardians. Other important novels by women writers include Fielding's sister Sarah's *David Simple* (1744-53), which challenged the gender norms of the period, Charlotte Lennox's *The Female Quixote* (1752), whose heroine's beliefs about life are modelled on the conventions of French heroic romances, and Elizabeth Inchbald's *A Simple Story* (1791) and *Nature and Art* (1796).

Apart from the fiction of Richardson and Sterne, sentimental novels of the period include Oliver Goldsmith's *The Vicar of Wakefield* (1766), in which the eponymous Dr Primrose has to learn to temper his instinctive magnanimity with worldly wisdom and Robert Mackenzie's *Man of Feeling* (1771), another novel which, while seizing every opportunity to evoke pathos, also cautions against the dangers of ingenuous good-heartedness.

Towards the end of the century, along with Godwin, novelists such as Robert Bage and Thomas Holcroft began to challenge the class assumptions of most earlier fiction. Holcroft's *Anna St. Ives* (1792) offers a variation on the basic plot of *Clarissa* by adding a third main character, a gardener who provides the heroine with an alternative to the aristocratic rake, and in so doing introduced the first proletarian hero into the English novel.

THE ENGLISH AUGUSTANS

Introduction

Writers of the late seventeenth and early eighteenth century who took their inspiration from the classics have frequently been referred to as "The English Augustans". The term derives from an essay by Goldsmith, who used it to suggest a parallel between the Rome of the Emperor Augustus (27 B.C.–14 A.D.) and Queen Anne's England (1702–14). It has been applied more generally to the Restoration era and most of the eighteenth century. Augustan writing is characterized by its emphasis on order, reason and decorum, its admiration for the classics and a belief in the commonality of human experience. In Johnson's words, "Great thoughts are always general and consist in positions not limited by exceptions". The major writers of England's Augustan Age were Dryden, Swift, Pope and Johnson. Gibbon's *Decline and Fall of the Roman Empire* (1776–88), which, in addition to chronicling its historical subject, can be seen as an elegy for the loss of the classical world, is often regarded as the last great Augustan classic.

Jonathan Swift (1667–1745)

Swift was born and brought up in Dublin, but spent his early adulthood moving between England and Ireland, where he served as an Anglican priest from 1694 and was later appointed as Dean of St Patrick's Cathedral in Dublin in 1713. He became increasingly committed to Irish political causes and his pamphlets protesting against English colonial exploitation made him a national hero in Ireland. They include *The Drapier's Letters* (1724), in which he assumed the persona of a Dublin draper to successfully oppose the introduction of a new form of coinage into Ireland, and the savagely ironic "A Modest Proposal" (1729), in which a supposedly moderate speaker exhorts the poor of Ireland to fatten their own children to provide food for the rich, since, after all, they have been metaphorically eaten by their English landlords already. Swift's health failed as he grew older and the ferocity of his satire led to claims that he had gone mad. It seems more likely that the symptoms of his Menière's syndrome, from which he had long suffered, had grown worse with age.

His Two Masterpieces

Perhaps the greatest of all British ironists, Swift's first masterpiece was *The Tale of a Tub* volume (1704), which comprises the title-work, "The Battle of the Books" and "The Mechanical Operation of the Spirit". "The Tale of a Tub" is an elaborate satire on aberrations in modern learning. It includes Swift's famous "Digression on Madness", in which a crazed speaker argues the case for the social and moral usefulness of insanity. While the work's digressions are central, the tale itself is an allegory of three brothers, who represent the Catholic, Anglican and dissenting branches of Christianity, with Swift demonstrating a preference for the Anglican middle way. "The Battle of the Books" stages a mock-heroic battle between ancient and modern volumes in the King's library as a device for debating the relative merits of classical and modern learning. The outcome is left undecided, but at the moment when the work breaks off, the ancients appear to be winning the day.

Swift's second masterpiece, *Gulliver's Travels* (1726), is superficially much more straightforward and its opening part, in which the hero finds himself a giant among the six-inch high people of Lilliput, has had an enduring appeal for children. However, Gulliver's Lilliputian experience also works on a more complex, allegorical level: it offers a satirical critique of contemporary British and European society. This is typical of the work as a whole and, as it continues, the tone of the *Travels* gradually darkens. In Part II, Gulliver visits the land of Brobdingnag, where the formula of Lilliput is reversed, as he finds himself a pigmy among giants. This perspective provides Swift with opportunities to illustrate the grossness of the human body, an aspect of his writing which has led to his being charged with misanthropy. The third part, in which Gulliver visits several places, satirizes what Swift saw as the excesses of modern scientific inquiry, particularly the experiments of the Royal Society.

The darkening vision reaches a climax in Part IV, in which Gulliver travels to the land of the Houyhnhmns, a species of super-rational horses, who stand in marked opposition to the other beings that inhabit their country, the bestial and filthy Yahoos. The Yahoos are identified with humankind and by the time Gulliver finally returns home his faith in human nature has collapsed to a point where he prefers the company of his horses to his family.

His Other Works

Swift's other works include the early *Bickerstaff Papers* (1708), in which he parodied the contemporary astrologer, Isaac Partridge by predicting his death and then subsequently, falsely, claiming he was really dead, and *The Journal to Stella* (1710–13), a collection of letters written to Esther Johnson, one of the two women in his life. Swift also produced a considerable body of poetry, mainly written in quatrains, which is generally less assured than his prose. His best known poems include "Baucis and Philemon", "Cadenus and Vanessa" and "Verses on the Death of Dr Swift".

Alexander Pope (1688–1744)

The greatest satirist of his age, Pope is generally regarded as Dryden's heir. Like Dryden he was a neo-classicist who used the heroic couplet to write scathing indictments of what he saw as failings in social and personal morality. In his own day his most popular works were his translations of Homer's *Iliad* (1720) and *Odyssey* (1725–6). Posterity has seen his witty satires as his greatest achievement. As a Catholic in the early eighteenth century, Pope was prevented from attending university and had private tutors. This and his physical make-up—he was approximately four feet six inches high and suffered from poor health throughout his life—led his critics to see Pope's satire as vindictive and personally motivated. In his own view, he was a compulsive moralist, who adhered to Dryden's view that "the true end of satire is the amendment of vices by correction".

Pope's first major poem, *An Essay on Criticism*

(1711), is both his artistic manifesto and an exploration of the state of literature at the time. It outlines his classical humanist creed and his belief that "True wit is Nature to advantage dressed/ What oft was thought but ne'er so well expressed". *Windsor Forest* (1713) is a pastoral celebrating the Peace of Utrecht, which ended the War of the Spanish Succession. In *The Rape of the Lock* (1712; enlarged 1714), Pope used the mock heroic form to poke gentle fun at a prank in Catholic high society and in so doing pointed up the distance between contemporary polite society and the world of classical epic, for example by modelling an account of the heroine's putting on her make-up on Homer's account of the arming of Achilles.

His Debt to Horace

The classical writer to whom Pope was most indebted was Horace and he imitated him in life as well as literature, seeing his own villa on the banks of the Thames at Twickenham as his equivalent of Horace's Sabine farm. His *Essay on Criticism* was modelled on Horace's *Ars Poetica* and he later wrote a series of poems, which imitated Horace's epistles and satires. While each of these poems has a particular addressee and specific satirical targets, collectively they demonstrate a preference for the values of the rural gentry over the newly emergent mercantilist classes. However, their abiding interest owes more to their comic portraiture and mastery of versification than their moral attitudes. *The Essay on Man* (1733 4), a philosophical poem on humanity's place in the universe, which was widely admired in its own day, remains notable for its aphorisms, but its didacticism leads to an unevenness of tone, as conversational passages give way to over-solemn moralizing.

In one sense, Pope's second major mock-epic poem, *The Dunciad* (first version 1728; final enlarged version 1743), is his equivalent of Dryden's *MacFlecknoe*, since, like the earlier poem, it mocks dullness through the use of elevation, and in so doing deflates its subjects, the literary poetasters of the period. However, *The Dunciad* is a work that rises above its mock-heroic origins and ribald comedy to assume the status of serious epic. Its wide-ranging allusions provide a catalogue of contemporary literary and social vices; and its fourth book, added towards the end of Pope's life, is especially notable for references to Milton's *Paradise Lost*, which link the poem's literary dunces to a broader vision of creeping moral chaos and disorder. The poem ends with a lament for the loss of classical humanist values, as the influence of dullness spreads outwards to engulf the whole of society.

Samuel Johnson (1707–84)

Born in Lichfield, Johnson went to London in 1737, along with his pupil David Garrick, who became the leading actor of his age, just as Johnson became its most famous writer. He was far from successful during his first years in the capital and his poem *London* (1738), a Juvenalian satire contrasting the values of the country and the city, expresses his early feelings of disillusionment. He struggled to establish himself as a writer, a predicament which probably led him to identify with his friend Richard Savage, an account of whose life he published in 1744. *The Life of Savage* is both the most immediate and the most polemical of Johnson's biographies: his personal involvement with his subject, whose controversial claim to be the repudiated illegitimate son of the Countess of Macclesfield Johnson fully supported, lend it a vivid first-hand quality lacking in his later *Lives of the English Poets* (1781). Johnson gradually established himself through his work in a range of genres and when George III granted him a royal pension in 1762, his financial position was secure. In later life he became a focal point for London literary life and his influence extended far beyond his own writings.

In 1764, along with the artist Sir Joshua Reynolds, he founded the Literary Club, whose members included Garrick, Oliver Goldsmith and Edmund Burke.

His Extraordinary Versatility

Johnson produced significant work in virtually every eighteenth-century literary form. His tragedy *Irene* was staged by Garrick in 1749. As a periodical essayist, he wrote two essays a week for *The Rambler* from 1750 to 1752 and weekly essays for *The Idler* from 1758 to 1760. As a lexicographer, he compiled his *Dictionary of the English Language* (1755) in eight years, while the French Academy's similar project is said to have taken forty men forty years. It was the first English dictionary to provide etymologies and literary examples of the usage of words as well as definitions, and is particularly remembered for the humour of Johnson's sometimes individualistic definitions. He referred to a lexicographer as "a harmless drudge" and defined oats as "A grain which in England is generally given to horses, but in Scotland supports the people". His alleged prejudice against Scotland lent a particular edge to his relationship with his Scottish biographer, James Boswell, whom he first met in 1763. However, his attitude changed after a journey to Scotland with Boswell, which resulted in Johnson's *Journey to the Western Islands of Scotland* (1775) and Boswell's *Journal of a Tour to the Hebrides* (1785).

Poet, Novelist, Editor and Critic

As a poet, Johnson followed *London* with another Juvenalian satire, *The Vanity of Human Wishes* (1749), his most important poem, in which he takes a lofty, ironic view of human aspirations. His only novel *Rasselas* (1759) is similar in theme. It employs the form of the Eastern Tale to investigate possibilities for human happiness, with the eponymous hero, a prince of Abyssinia, being schooled by the worldly wise philosopher, Imlac, who tells him "Human life is everywhere a state in which much is to be endured, and little to be enjoyed". As an editor, Johnson produced an edition of *Shakespeare's Plays* (1765), more notable for its literary criticism than its elucidation of Shakespeare's texts.

His abilities as a critic also informed his *Lives of the English Poets*, the most comprehensive biographical collection of the century, which combines biography with criticism and a "character" of the poet. The *Lives* vary considerably in direction and quality and while none is as tendentious as the earlier *Life of Savage*, several, such as "The Life of Cowley", in which Johnson attacked the Metaphysical Poets, are openly polemical in their advocacy of a particular attitude or approach. Along with Cowley, the lives of Milton and Pope are among the finest.

Finally, Johnson's reputation owes at least as much to his being the subject of one of the greatest biographies in the English language, Boswell's *Life of Johnson* (1791), which records his witty conversation and personal eccentricities, along with a circumstantial account of his personal and public life that makes him the most fully documented subject in eighteenth-century literature.

Personal Writings

Biography and autobiography came of age in the late eighteenth century. Johnson's *Lives of the English Poets* are often opinionated, but demonstrate an attention to individual detail that had been rare in earlier personal writings. Boswell's *Life of Johnson* is widely regarded as the first modern biography, since it demonstrates an unprecedented attention to researched detail, a commitment to accuracy and an endeavour to treat its subject's life exhaustively. Boswell brings Johnson alive by including details of his mannerisms and records of his *bon mots*, in dramatic scenes, some of which he consciously engineers. He also kept intimate journals of his own life, which remained unpublished until the twentieth century. Best known among these is his *London Journal, 1762 63*, a fascinating companion-piece to the section of the *Life of Johnson* in which he first becomes acquainted with his subject, since it records his private emotions and amorous encounters from the same period.

Gibbon's *Autobiography* (originally entitled *Memoirs of My Life and Writings*, 1796) is an account of the forces that shaped the character of the historian of *The Decline and Fall of the Roman Empire*, written in a detached, ironic style. Other notable personal writings of the age include the diary of Fanny Burney and the letters of Horace Walpole and Lord Chesterfield, whose missives to his natural son collectively come to form a conduct book instructing a young gentleman in matters of breeding, morality and intrigue.

The Periodical Essay

Joseph Addison and Richard Steele's *The Spectator* (1711–14) established the essay as an important genre in its own right. Its essays are notable for their observations on the manners of the period and for their creation of a club, whose members include representatives of various aspects of early eighteenth-century life, with the country gentleman, Sir Roger de Coverley, being the most memorable. The periodical essay flourished throughout the century and important later sequences include Johnson's *Rambler* essays, which range over a broad sweep of subjects, often offering moral instruction, and Oliver Goldsmith's *Citizen of the World* (1760–62), a collection of letters supposedly written by and to a Chinese visitor to London, which provides apparently ingenuous comments on English manners and customs

Poetry of Landscape and Reflection

As the century progressed, classical models for poetry were gradually replaced by approaches that anticipated the Romantic Movement in their concern with Nature, individual emotions, the sublime, rural life and melancholy thoughts. Thomson's *Seasons* (1726–30) looks back to classical pastoral and forwards to the Romantic emphasis on Nature's influence on human sensibilities. Edward Young's *Night Thoughts* (1742–6) is the most famous longer work of the "graveyard poets", whose melancholy meditations on mortality took their inspiration from graveyard settings. The greatest of such poems is Thomas Gray's "Elegy Written in a Country Churchyard" (1751), where the slow, measured verse provides a vehicle for an elegiac meditation on the transience of human life and the particular fate of the humble villagers who are buried in the churchyard.

Village life is also the subject of Goldsmith's *The Deserted Village* (1770), an elegy for rural life which laments the depopulation of the countryside occasioned by the agrarian revolution and the enclosure of common land, and George Crabbe's *The Village* (1783), which took issue with Goldsmith's idealized view of the rural past. William Cowper's finest achievement, *The Task* (1785) is an introspective poem on the pleasures of country life. Other notable eighteenth-century poets whose meditative response to landscape anticipates the Romantics include William Collins, Mark Akenside and Christopher Smart.

Eighteenth-Century Drama

The beginning of the eighteenth century saw a reaction against the licentiousness of Restoration Comedy in favour of a drama that placed its main emphasis on sentimentalism and the cultivation of fine feelings. The cult of sentimentalism continued to exert an important influence on English drama for more than half a century; and representative plays in this genre include Colley Cibber's *The Careless Husband* (1702), Steele's *The Conscious Lovers* (1722) and Richard Cumberland's *The West Indian* (1771).

The early part of the century also saw the growth of a very different kind of drama, the burlesque play. The popularity of the burlesque can be dated back to George Villiers's parody of Restoration heroic drama, *The Rehearsal* (1671), but it assumed new dimensions with the success of John Gay's masterpiece, *The Beggar's Opera* (1728). Ostensibly a satire on the contemporary vogue for Italian opera, Gay's play broadens out into a wide-ranging critique of the social life of the period, in which aristocrats are replaced by highwaymen and merchants by fences. Much of its appeal arose from its lively music, which replaced operatic arias with popular ballads. Other notable burlesques include Gay's *The What d'ye Call It* (1715), Fielding's *Tom Thumb* (1730) and Henry Carey's *Chrononhotonthologos* (1734).

Oliver Goldsmith (1728–74)

Oliver Goldsmith initiated a movement away from sentimental comedy in his essay, "Comparison between Laughing and Sentimental Comedy" (1773), which attacked the vogue for sentimentalism and argued that humour should return to the English stage. His play, *The Good Natur'd Man* (1768) is a particularly interesting dramatization of the debate about the form that comedy should take, as its hero is both satirized for his foolish magnanimity and genuinely benevolent. Goldsmith's most famous play, *She Stoops to Conquer* (1773), in which a young gentleman mistakes his prospective father-in-law's house for an inn, has had a much more enduring appeal, based as it is on a series of comic misunderstandings that rise above its period and setting.

Richard Brinsley Sheridan (1751–1816)

Goldsmith's contemporary, Richard Brinsley Sheridan, also transcended the conventions of sentimental comedy. His plays employ a broad range of comic effects that derive their humour from situation, character and verbal wit. *The Rivals* (1775), a comedy of manners set in fashionable Bath society, is best remembered for its broad comic characters, particularly Mrs Malaprop, whose habit of confusing similar sounding words (*e.g.* her reference to "an *allegory* on the banks of the Nile") was responsible for the introduction of the term "malapropism" into the language. Sheridan's *The School for Scandal* (1777), a play which redeploys character types from Restoration comedy and makes brilliant use of comic situations, is the finest achievement of late eighteenth-century comedy.

THE ENGLISH ROMANTICS

Introduction

The end of the eighteenth century saw a major shift in literary and cultural taste with the emergence of the Romantic Movement. Its most important characteristics included a belief in the shaping power of the imagination (defined in a range of ways by the various Romantics) rather than reason, a stress on individual experience and a desertion of neo-classical norms in favour of a more emotive and spontaneous approach to life. However, no two major Romantic poets held the same beliefs and Byron's poetic practice was markedly different from those of his contemporaries.

The beginnings of English Romanticism are usually associated with the Lake Poets, Wordsworth, Coleridge and Southey, but it had evolved gradually and Romantic elements can be found in such diverse forms as earlier eighteenth-century poetry of landscape and reflection, the Gothic novel, a growth of interest in the classical notion of the sublime, late eighteenth-century sentimentalism and a fascination with the pictorial, particularly as mediated by Italian landscape painting.

William Blake (1757–1827)

Blake was a writer and artist whose genius developed outside the dominant cultural conventions of his day. Educated at home, he was apprenticed to an engraver at the age of fourteen. He developed a new method of "illuminated printing", in which he blended the text of his poems with colour engravings, and a distinctive symbolism which expressed his highly personal visionary philosophy. His artistic individuality was complemented by his nonconformist views. The son of a dissenter, he was influenced by the beliefs of the Swedish mystic, Emmanuel Swedenborg and the egalitarian political philosophy of his friends and contemporaries, William Godwin and Thomas Paine.

An early volume of *Poetical Sketches* (1783) was followed by his most popular work, the collection of lyrics *Songs of Innocence* (1789), which was expanded to become *Songs of Innocence and Experience* (1795). The latter volume's sub-title indicates its intention to depict "the two contrary states of the human soul" and it includes paired poems, such as "The Lamb" and "The Tyger", which illustrate the dialectical opposition between the Edenic innocence of childhood and the corrupted experience of adulthood. Other poems in the collection include "The Little Black Boy" and "The Chimney Sweeper".

His Mystical Vision

Blake's mystical vision receives extended expression in his numerous prophetic books, where the style is in marked contrast to the apparent simplism of his *Songs*, though profundity and naivety often co-exist. The prophetic books, which he wrote, engraved and published himself, include: *Visions of the Daughters of Albion* (1793), *America: A Prophecy* (1793), *The Book of Urizen* (1794), *The Book of Ahania* (1795), *The Book of Los* and *The Song of Los* (1795), *Jerusalem: The Emanation of the Giant Albion* (1804–20) and *The Ghost of Abel* (1822). Blake was fascinated by *Paradise Lost*, taking the view that "Milton was a true poet and of the devil's party without knowing it". He attacked Milton in his "Los" sequence, which inverts aspects of *Paradise Lost*, and in *Milton: A Poem in Two Books* (1804–8). The latter contains his short poem, "Jerusalem", from which the popular hymn was later taken. Blake's most important prose work, *The Marriage of Heaven and Hell* (1790–93), is a collection of aphorisms, which again demonstrates his belief that "without contraries is no progression".

William Wordsworth (1770–1850)

Wordsworth was university-educated, but the key formative influence on his artistic development, which he describes in his poetic autobiography *The Prelude*, was his early love of Nature, developed during his boyhood in the English Lake District. A walking tour in France, the Alps and Italy and a further visit to France during the first phase of the French Revolution also contributed significantly to the shaping of his poetic sensibility.

His Earliest Verse

The diction of Wordsworth's earliest verse is barely distinguishable from that of most of his contemporaries, but his first major work, *Lyrical Ballads* (1798), to which Coleridge also contributed, signalled one of the most radical changes in English poetry. Unfavourably received on its first appearance, the volume focuses on humble countryfolk, children and dispossessed mothers, describing their lives in a style of cultivated simplicity based on "the language of conversation in the middle and lower classes of society". Among its best-known poems are "We Are Seven", "The Thorn", "Simon Lee" and "The Idiot Boy". It also contains one of Wordsworth's most famous poems, "Lines written a few miles above Tintern Abbey", a meditation on the effect this landscape has had on his "moral being".

In the Preface to the second edition (1800), in which the poem "Michael" was added, Wordsworth provides a manifesto for his kind of Romantic verse, stressing that the principle object of the poems has been "to choose incidents and situations from common life, and to relate or describe them, throughout, in a selection of language really used by men". He explains that "Humble and rustic life was generally chosen, because, in that condition, the essential passions of the heart find a better soil in which they can attain their maturity, are less under restraint, and speak a plainer and more emphatic language". He also adumbrates his belief that "all good poetry is the spontaneous overflow of powerful feeling", another facet of his work which represents a marked departure from neo-classical poetic practice.

His Finest Long Poem

Wordsworth's finest long poem *The Prelude* exists in two versions (1805 and 1850), neither of which was published in his own life-time. Although it is an autobiography, it places its emphasis on "the growth of a poet's mind" (its sub-title) and Wordsworth dramatizes his own experience as representative of the poetic life. Written in blank verse, it describes his upbringing in the Lake District, his disenchantment with conventional forms of learning, town life and the political philosophy of William Godwin and the French Jacobins, who had been early inspirations to him. Against these, he sets the power of the poetic imagination, acting in communion with a Pantheistic Nature. The poem was intended as an introduction to a long philosophical poem to be called *The Recluse*, but only the second part of this, *The Excursion* (1814), which suffers in comparison with *The Prelude*, was ever completed.

Wordsworth's last major collection of shorter pieces, *Poems in Two Volumes*, was published in 1807. It includes some of his best-loved poems, among them "Daffodils" ("I wandered lonely as a cloud"), his sonnet "Composed Upon Westminster Bridge" ("Earth has not any thing to show more fair") and one of his finest tributes to rural simplicity, "Resolution and Independence", also known as "The Leech-Gatherer". His ode, "Intimations of Immortality from Recollections of Early Childhood", also published in this volume, is both a celebration of childhood innocence and a lament for the loss of the "visionary gleam" that has provided his early poetic inspiration. He published numerous further volumes, including *The White Doe of Rylstone* (1815), *Peter Bell* (1819) and *Sonnets* (1838). He became Poet Laureate in 1843, but virtually all his important poetry had been written in the first half of his life.

Samuel Taylor Coleridge (1772–1834)

Wordsworth's collaborator on the *Lyrical Ballads*, Coleridge had developed a distinctive range of republican and millenarian beliefs, again associated with the optimism of the first phase of the French Revolution, prior to meeting Wordsworth in 1797. Wordsworth's belief in the power of Nature probably influenced his conversation poem "Frost at Midnight" (1798) and during the first year of their friendship he wrote three of his most important poems, "The Rime of the Ancient Mariner", "Christabel" and "Kubla Khan". "The Ancient Mariner" appeared in the *Lyrical Ballads* (1798). Written in ballad metre, it is a tale of crime and absolution, told to a wedding guest, whom the mariner detains to listen to his story. The mariner shoots an albatross, a supposed good omen, during a voyage in the southern seas. When his ship subsequently suffers misfortunes, he is blamed by his crewmates for their sufferings and in the conclusion is absolved by a hermit. The ostensibly simple Christian morality of the ending is undermined by the existential arbitrariness inherent in the poem's depiction of sin and redemption and the mariner's intrusion into the festive occasion of the wedding leaves his auditor "a sadder and a wiser man".

"Kubla Khan" and "Christabel" were published in *Christabel and Other Poems* (1816). The former is a symbolically powerful, but obscure fragment, reputedly produced after a laudanum-induced dream. Its use of luxuriant, oriental imagery creates an evocative Romantic ambience that overshadows any clear meaning, but suggests an allegory about creativity. The equally enigmatic and unfinished "Christabel" is more obviously an allegory, about innocence, which draws on Gothic motifs. "Dejection: An Ode" (1802) begins by expressing sentiments reminiscent of Wordsworth's comments on his waning creative powers in the Immortality Ode and continues by looking for solace in the power of the imagination rather than external Nature. Coleridge's poetic gifts fell away in later life, a decline which has variously been attributed to the ending of his friendship with Wordsworth and his addiction to opium.

His Other Writings

Along with his comparatively small corpus of poems, Coleridge's most important contribution to the development of English Romanticism was his *Biographia Literaria* (1817), an extended prose work which blends autobiography and philosophical deliberations in an haphazard structure that allows him free rein to express his thoughts on life and literature. It is most notable for Coleridge's reflections on the psychology of the creative process, particularly his belief in the imagination's capacity to unify opposing aspects in the human psyche and contemporary society. Its numerous other subjects include a critique of Wordsworth, discussion of the philosophy of Kant and his contemporaries, essays on Shakespeare and advice to aspiring writers.

Table Talk (1836) is a record of Coleridge's conversations, for which he became famous in later life.

George Gordon Byron, Lord (1786–1824)

From one point of view, Byron was the archetypal English Romantic poet: his public persona perfectly fitted the nineteenth-century's conception of what such a poet should be and his fame throughout Europe was unrivalled. However, his poetry demonstrates little affinity with the more introspective aspects of the Romantic imagination and it is formally the most classical work produced by any of the major English Romantics. An admirer of Pope, Byron wrote much of his early verse in heroic couplets and throughout his work "Romantic" themes are tempered by a witty epigrammatic style that is more characteristic of Augustan verse.

His Early Life

Byron's inheritance of an aristocratic title, a clubfoot, sexual abuse by his nurse and an incestuous relationship with his half-sister, Augusta Leigh, all contributed to making his early years markedly different from those of the other English Romantics. After a strict Scottish Calvinist upbringing, he became the sixth Baron Byron and inherited the family estate at Newstead Abbey in Nottinghamshire when he was ten. His reputation as a libertine, atheist and radical idealist began during his time at Cambridge. His first important work was Cantos I and II of *Childe Harold's Pilgrimage* (1812; Cantos III and IV, 1816 and 1818), a poem in Spenserian stanzas about the European wanderings of a young man disillusioned with his hedonistic life-style. It was followed by a series of hastily written verse tales—*The Bride of Abydos* (1813), *The Giaour* (1813), *The Corsair* (1814) and *Lara* (1814)—most notable for their development of the figure of "the Byronic hero", a romantic adventurer with a mysterious past. Along with Shelley and Mary Wollstonecraft Godwin, Byron left England in 1816 and after a stay in Switzerland settled in Italy. He died in Greece of fever, having gone there to fight in the Greek struggle for Independence from Turkey.

His Later Period

Most of Byron's best work belongs to his later period. It includes one of his finest shorter poems, *The Prisoner of Chillon* (1816), the dramatic poem, *Manfred* (1817), in which the hero is an outcast haunted by past crimes, and the "Venetian tale", *Beppo* (1818), written in ottava rima, a form which ideally suited his witty imagination. He also employed ottava rima in two of his finest poems, *The Vision of Judgement* (1822) and *Don Juan* (1819–24). The *Vision* is a wickedly funny parody of the Poet Laureate Robert Southey's similarly named poem (1821) about George III's arrival in heaven.

Don Juan, the unfinished thirteen-canto poem for which Byron is best known to posterity, is an epic account of the exploits of the legendary Spanish philanderer. Its use of ottava rima provides Byron with a perfect vehicle for a witty picaresque consideration of a range of contemporary philosophical and social issues, as well as ample opportunity to project himself into the complex figure of his protagonist. His play *Cain* (1821), in which the archetypal murderer of the Book of Genesis becomes a sympathetic rebel learning about the universe under the instruction of Lucifer, is his most extreme treatment of the figure of the exiled expatriate.

Percy Bysshe Shelley (1792–1822)

Expelled from Oxford, after writing a pamphlet advocating atheism, Shelley was the most reviled of the Romantic poets in his own day. He was also the most intellectually intense of the younger generation of Romantics and his poetry is suffused with a philosophical seriousness not to be found in Byron's work and a seemingly artless spontaneity not to be found in Keats's more direct and controlled imagery. His most famous statement on the imagination comes in his *Defence of Poetry* (written 1821; published 1840), which sees poets as the "unacknowledged legislators of the world" and champions the power of inspiration, which he associates with a Platonic view of life. Shelley was an ardent admirer of the Pantheism of "Tintern Abbey", but like Byron he felt that Wordsworth had betrayed his early radicalism. His first important poem, *Queen Mab* (1813) is a radical attack on a broad range of social targets, including marriage and institutionalized Christianity, in which the fairy queen of the title looks forward to a future in which society's ills will be cured. *Alastor, or the Spirit of Solitude* (1816) is a more introspective poem, which depicts an idealist's failure to find an external correlative for his dreams. The Odes, "Hymn to Intellectual Beauty" and "Mont Blanc", also belong to this phase of Shelley's career.

Shelley and Revolutionary Causes

At a time when absolutist governments were being reinstated in several parts of Europe in the wake of the Battle of Waterloo, Shelley wrote various poems and plays supporting revolutionary political causes. *The Revolt of Islam* (1818), a long poem in Spenserian stanzas, combines a radical political impulse with his idealized belief in human perfectibility. *The Cenci* (1819) is a verse tragedy based on a Renaissance legend, in which Shelley found a perfect subject for one of his most powerful allegories about resistance to tyranny. His masterpiece, *Prometheus Unbound* (1820), is a passionate lyrical drama, which takes the Greek Titan who rebelled against Jupiter, the king of the gods, as its hero. Rooted in Shelley's Platonic beliefs, the play operates on a number of levels, but is most obviously a socio-political allegory, protesting against all forms of tyranny. Like Byron, Shelley supported the Greek struggle against Turkish rule, and his last completed work, *Hellas* (1822), was a lyrical drama inspired by this cause.

Epipsychidion (1821) is an autobiographical poem about a Dantean quest for ideal beauty, which also deals with the creative process. Shelley's famous elegy on Keats's death, *Adonais* (1821), both laments his younger contemporary's passing and pays tribute to his poetic genius, which Shelley believed had not been sufficiently recognized. The poem also reflects Keats's own belief in the immortality conferred by beauty. Shelley's satires include "England in 1819", a vitriolic sonnet on the state of the nation at the end of George III's reign and *The Mask of Anarchy* (written 1819; published 1832), his most ambitious work of this kind, which responded to the news of the "Peterloo Massacre" of 1819, by equating the government's behaviour in ordering soldiers to shoot peaceful demonstrators for political reform with anarchy.

His shorter poems, which mainly take political freedom and love as their themes, include "Ode to Liberty", "Ode to Naples", "The Cloud", "The Indian Serenade", "Ozymandias", "Ode to the West Wind" and "To a Skylark".

Shelley drowned when his boat capsized in a storm off the coast of Italy, where he had been living since 1818. At the time of his death he was working on another Dantean poem, *The Triumph of Life* (1824), a dream allegory about the human condition, which breaks off at a point where it appears to be suggesting not the triumph, but the meaninglessness, of life.

John Keats (1795–1821)

The son of a livery-stable manager, Keats became a certificated apothecary in 1816 and subsequently trained as a surgeon, but abandoned this profession to pursue a literary career. His first collection, *Poems* (1817), which received a hostile critical reception, included "Sleep and Poetry" and the sonnet "On First Looking into Chapman's Homer". It was followed by *Endymion* (1818), a romance in four books, based on the Greek legend of a shepherd who falls in love with the moon goddess and is spirited away to live with her eternally. Best remembered for its opening line, "A thing of beauty is a joy for ever", *Endymion* is an uneven allegory about the poet-dreamer's quest for perfection.

His Finest Poetry

Keats's finest poetry appeared a year before his early death in *Poems of 1820*. This includes three narrative poems dramatizing a conflict between romantic enchantment and a world of colder actuality. In "Lamia", a young man's love for a serpent that has taken human shape ends when a philosopher calls her by her real name and she reverts to her original identity. In "Isabella or the Pot of Basil", Keats took his story from Boccaccio, using the appropriately Italianate stanza form of ottava rima for his medieval Italian subject. Romantic love is once again destroyed, when the Florentine heroine's beloved is murdered by her proud brothers.

In "The Eve of St Agnes", his most assured longer poem, Keats employed the Spenserian stanza for another medieval subject. Breathing life into the legend that a virgin may see a vision of her lover on St Agnes's Eve, he produced some of his most perfectly realized physical description to depict a vivid contrast between the wintry cold of external nature and the sensuous warmth of the lovers' interior, in this case allowing the romantic dream world to evade the constraints of everyday reality.

Poems of 1820 also contains Keats's unfinished epic poem, "Hyperion", and the five odes which secured his reputation as one of the greatest of English poets. The richly luxuriant language of the odes embodies Keats's belief in the power of beauty, while also lamenting its transience. "Beauty that must die" is the central theme of "To Autumn" and "To Melancholy". "On a Grecian Urn" suggests the ambiguity of the immortality conferred by art, by reflecting on the paradoxical spring-like situation of two lovers, who transcend death through being depicted on the urn, but whose love remains unconsummated in the frozen stasis of such representation. It culminates with the famous utterance, "Beauty is truth, truth beauty, -that is all/Ye know on earth, and all ye need to know". "To a Nightingale" sees the bird as a symbol of artistic immortality that offers release from "the weariness, the fever, and the fret" of the everyday world. "To Psyche" addresses a neglected pagan goddess who symbolises the human soul made immortal through love.

Seriously ill with tuberculosis, Keats travelled to Italy in late 1820 and died there the following year. He had composed his own epitaph: "Here lies one whose name was writ in water".

Other Romantic Poets

Although he died before the Romantic period, Thomas Chatterton, who committed suicide in 1770 at the age of seventeen, came to be seen as the epitome of Romantic genius, unable to survive in a hostile world. Keats dedicated *Endymion* to him and Wordsworth, referred to him as the "marvellous boy", whose early "gladness" descended into "despondency and madness" ("Resolution and Independence"). Henry Wallis's 1856 Pre-Raphaelite painting further contributed to the growth of the Chatterton myth.

Scotland's most famous poet, Robert Burns, was another important precursor of the Romantic movement, both in his use of ordinary speech in *Poems Chiefly in the Scottish Dialect* (1786), which Wordsworth and Coleridge greatly admired, and for his treatment of rustic and Gothic themes in works such as his finest narrative poem, *Tam o'Shanter* (1791).

Leigh Hunt, who was influential in promoting the reputations of Keats and Shelley, is best remembered for *The Story of Rimini* (1816) and his *Autobiography* (1850). Coleridge's associate, Robert Southey, was held in considerable esteem in his own day and became Poet Laureate in 1813, but his reputation declined after his death. Sir Walter Scott first established his reputation as a writer of historical verse romances and his work in this genre includes *The Lay of the Last Minstrel* (1805) and *Marmion* (1808). John Clare, the "Northamptonshire peasant poet", was acclaimed for his *Poems Descriptive of Rural Life and Scenery* (1820) and subsequently published *The Village Minstrel* (1821) and *The Shepherd's Calendar* (1827), but spent most of his later life in a lunatic asylum, where he continued to write.

Notable Romantic women poets include Hannah More, Charlotte Smith, Ann Yearsley, Mary Robinson, Helen Maria Williams and Felicia Dorothea Hemans, several of whom wrote poems that contributed to the campaign for the abolition of the slave trade. Byron's former lover, Lady Caroline Lamb, wrote *A New Canto* (1819), in which she adopted the persona of Byron and appropriated the style of *Don Juan* in order to mock him, along with a range of targets from contemporary society.

Romantic Prose

In addition to the Preface to the *Lyrical Ballads*, Coleridge's *Biographia Literaria* and Shelley's *Defence of Poetry*, other important non-fictional prose of the Romantic period includes Mary Wollstonecraft's pioneering feminist work, *A Vindication of the Rights of Women* (1792), which makes a powerful case for gender equality and among other things sees "female" characteristics such as submissiveness as the product of nurture rather than nature. William Godwin's *Enquiry Concerning Political Justice* (1793), which set out a philosophy of human perfectibility, was the most influential political treatise of the early Romantic period, but its fame was comparatively short-lived.

Edmund Burke's prose masterpiece, *Reflections on the Revolution in France* (1790), took a conservative stand against the changes effected by the Jacobin revolutionaries and more generally lamented, "The age of chivalry is gone. That of sophisters, economists, and calculators, has succeeded; and the glory of Europe is extinguished forever."

Thomas Paine's *The Rights of Man* (1791 2) responded to Burke by justifying the revolutionaries and arguing the case for natural rights shared by all men; and, in its second part, compared the new French and American constitutions with that of Britain, to the detriment of the latter.

Important collections of essays include William Hazlitt's *English Comic Writers* (1819) and *The Spirit of the Age* (1825), a collection of portraits of his contemporaries, and Charles Lamb's *Essays of Elia* (Vol. I, 1823; Vol. II, 1833). Thomas De Quincey's autobiographical *Confessions of an English Opium Eater* (1822; enlarged 1856) describes the effects of his addiction to laudanum and his gradual success in moderating his habit. Keats's letters are notable for his comments on "beauty", "truth" and the Romanic imagination.

EARLY NINETEENTH-CENTURY FICTION

Sir Walter Scott (1771–1832)

The most highly regarded Romantic novelist of the nineteenth century, Scott began his writing career as a poet, achieving critical and popular success with *The Lay of the Last Minstrel* (1805), a six-canto poem in ballad verse based on a traditional story about a sixteenth-century feud in the Scottish Borders. Several further long narrative poems in a similar vein, including *Marmion* (1808) and *The Lady of the Lake* (1810), followed. Scott's first novel *Waverley* (1814) propelled his reputation to new heights and he followed this with several more "Waverley novels", which also offered vivid portraits of various aspects of recent Scottish history: *Guy Mannering* (1815), *The Antiquary* (1816), *The Black Dwarf* (1816), *Old Mortality* (1816), *Rob Roy* (1817), *The Heart of Midlothian* (1818), *The Bride of Lammermoor* (1819) and *A Legend of Montrose* (1819).

Beginning with *Ivanhoe* (1820), a romance set in the England of Richard I's time, Scott extended his prolific talents to fiction that recreated a broader range of historical eras and locations. Novels from this phase of his career include *The Abbot* (1820), *Kenilworth* (1821), *The Fortunes of Nigel* (1822), *Peveril of the Peak* (1822) *Quentin Durward* (1823), *Redgauntlet* (1824) and *The Talisman* (1825). *St Ronan's Well* (1824), a novel of manners set in a Scottish spa, was a rare departure into the nineteenth century.

He was knighted in 1820 and continued to be held in high esteem, but suffered financial ruin in 1825 and his novels written after this, which include *Woodstock* (1826) and *The Fair Maid of Perth* (1828), show a falling off in his talent.

The Strength of Scott's Writing

Scott's fiction drew on his reading of ballads and medieval romances and his various other antiquarian interests. Its strengths lie in its atmospheric descriptions of landscape, its vivid depiction of minor characters, its skill in evoking past periods—albeit in a romanticized manner—and its capacity for chronicling historical processes. During his lifetime he was frequently compared with Shakespeare and his reputation remained high throughout the nineteenth century, nowhere more so than in his native Scotland, where he became a cultural icon and a model for Victorian codes of genteel behaviour. Changes in taste, particularly a reaction against the kind of melodramatic romanticism his fiction embodies, subsequently led to a decline in his popularity, though he continues to be respected as a major regional novelist and as the author of memorable shorter poems (originally in his longer works), *e.g.* "Lochinvar" and "Breathes There the Man".

Jane Austen (1775–1817)

The daughter of a Hampshire rector, Jane Austen has been described as the first major modern novelist. Her superficially restrained and psychologically subtle fiction is a world away from the expansiveness and magniloquence of Scott, but it has stood the test of time better and today she is the most widely read novelist of her era. Her first piece of extended fiction, *Love and Friendship* (1790), was a burlesque of Richardson and in one sense her work belongs to the counter-tradition of Fielding, since it employs irony to satirize deviations from social norms. However, its range is narrower than Fielding's—it usually deals with "three or four families in a country village", with occasional forays into fashionable town society —and her characterization is more complex.

Her first full-length novel *Northanger Abbey* (posthumously published in 1818) involves a satire on Gothic fiction such as *The Mysteries of Udolpho*, as the heroine Catherine Moreland wrongly imagines that that the house of the title conceals dark secrets. It also engages with the themes that dominate Austen's subsequent fiction: the witty observation of social manners and the moral education of the heroine. The ironic first sentence of *Pride and Prejudice* (1813), "It is a truth universally acknowledged, that a single man in possession of a good fortune, must be in want of a wife", introduces the principal subject of Austen's most famous comedy of manners. The "universally acknowledged" truth in question represents the perspective of Mrs Bennet, the mother of five daughters whom she is anxious to marry off, and courtship and marriage are the pivot on which the plot turns. The central figure is Mrs Bennet's second daughter, Elizabeth, who initially rejects the advances of the seemingly arrogant Fitzwilliam D'Arcy, believing him to be the author of her family's misfortunes, but comes to learn that her prejudice, which has caused her to misinterpret his character, surpasses his pride.

The Success of *Emma*

The heroine of *Emma* (1816) is generally viewed as Austen's most lively creation; she is certainly her most meddlesome. Her efforts to broker a marriage for the illegitimate Harriet Smith, whom she adopts as a protegée, prove disastrous. Her blindness to her own feelings involves a level of self-delusion that outstrips that of either Catherine Moreland or Elizabeth Bennet, but once again the novel charts her moral education and she is finally united with the discerning Mr. Knightley. The heroine of *Mansfield Park* (1814), Fanny Price, is more passive. She is the virtuous poor relative in the house of the well-to-do Bertram family and her integrity offers a sharp contrast to the moral laxity that invades the country house of the title while its patriarch, Sir Thomas Bertram is away in Antigua. The house represents a stable upper middle class English social world, which is contrasted with disorder in the urban worlds of London and Portsmouth. Order is finally restored and Fanny's story has a Cinderella-like happy ending, when her love for Sir Thomas's son, Edmund, results in marriage.

Austen's other major novels, written at the opposite ends of her writing career, *Sense and Sensibility* (1811) and *Persuasion* (1818), both deal with conflicts between love and family obligations and include sections set in fashionable town society.

Thomas Love Peacock (1785–1866)

A close friend of Shelley, whom he often advised on literary and philosophical matters, Peacock is best remembered as a satirical novelist, whose fiction debates and ridicules many of the fashionable social and political attitudes of his day. Several of his novels employ a country house setting, in which a group of guests discuss contemporary intellectual controversies, while the novels themselves incorporate a miscellany of farcical elements, songs and improbable love stories that culminate in incongruously perfunctory happy endings. Novels of this kind include *Headlong Hall* (1816), where the characters represent opposed political and social views and the action ends in four hastily contrived marriages, *Nightmare Abbey* (1818), in which the attitudes of Coleridge, Byron and Shelley are all mocked, *Crotchet Castle* (1831), in which a Coleridge figure is once again included among the satirical portraits, and the later *Gryll Grange* (1860-1), in which a satirical view of mid-Victorian England is juxtaposed with a nostalgic vision of the recent past. His other novels include *Maid Marian* (1822) and *The Misfortunes of Elphin* (1829).

THE VICTORIAN NOVEL

Charles Dickens (1812–70)

Dickens's extraordinary popularity began with the publication of *The Pickwick Papers* (1836–7), which grew from a commission to write a series of sporting sketches and which contains the first of his many memorable characters that have become part of the English popular imagination, Mr Pickwick and his manservant Sam Weller. Prior to this, he had published *Sketches by Boz* (1835-6). *Oliver Twist* (1838) was his first popular masterpiece to combine vivid action and characterization with a critique of the divisions of the class-ridden society of his day, which he felt had been intensified by measures such as the Poor Law of 1834. It was followed by: *Nicholas Nickleby* (1839), which in its scenes set at Dotheboys Hall attacked the harsh regime of contemporary Yorkshire boarding schools; the hugely popular, albeit sentimental *The Old Curiosity Shop* (1841); *Barnaby Rudge* (1841); and *Martin Chuzzlewit* (1843).

The 1840s also saw the publication of the first and best-loved of his Christmas books, *A Christmas Carol* (1843), in which he created the memorable figure of the miser, Ebenezer Scrooge.

His Finest Novels

In the years that followed Dickens produced many of his finest novels: *Dombey and Son* (1848); *David Copperfield* (1850), his most autobiographical work as well as his own favourite novel; *Bleak House* (1853); *Hard Times* (1854), an attack on Utilitarianism set in the fictional northern city of Coketown; *Little Dorrit* (1857); *A Tale of Two Cities* (1859), a novel set during the French Revolution; *Great Expectations* (1861); and *Our Mutual Friend* (1865). All of these novels blend serious social criticism and entertainment, albeit in varying degrees.

Great Expectations, with its rich gallery of characters (the betrayed spinster Miss Havisham, the blacksmith Joe Gargery, the convict Magwitch, the lawyer Jaggers and his clerk Wemmick's Aged Parent among them), keeps these two aspects of his work in perfect balance, as the hero Pip slowly comes to recognize the class snobbery that has made him ashamed of his early origins.

Bleak House, where the interminable case of Jarndyce and Jarndyce serves as a metaphor for the British legal system and *Little Dorrit*, where the bureaucracy of the Circumlocution Office becomes a central symbol of the paralysis at the heart of government, are longer and more complex novels that also show Dickens's talent at its finest.

Dickens and Social Injustice

Dickens's concern with social injustices has often been seen to stem from his early experience of life. His father, on whom he based aspects of Mr Micawber in *David Copperfield*, was jailed for debt in London's Marshalsea prison, which becomes a central setting in *Little Dorrit*. As a consequence of the family's misfortunes, Dickens himself had to work in a blacking factory, where he became aware of the seamier side of London life at an early age.

Dickens has been criticized for his sentimentality, the disorderliness of some of his plots and his tendency to replace character with caricature. He remains one of the greatest storytellers in English literature, a social critic whose reforming fervour played a part in eradicating some of the social ills he dramatized, a writer with a unique flair for bringing the many facets of London life alive in an almost tactile way and the creator of many of the most memorable characters in the English novel.

Arguably the most prodigious genius among Victorian writers, he gave highly popular public readings of his work throughout his career. He collapsed during his final reading tour (1869-70) and died soon afterwards, leaving his last novel, *The Mystery of Edwin Drood* (1870) incomplete.

William Makepeace Thackeray (1811–63)

In the middle of the nineteenth century, when his most successful novel *Vanity Fair* (1847-8) was serialized at the same time as *David Copperfield*, Thackeray's work was frequently compared with that of Dickens, though his popularity with the general public never reached quite the same heights. A satirist of class snobbery, he did not share Dickens's sympathy for the criminalized poor. Thus the picaresque hero of his novel *The Luck of Barry Lyndon* (1844), set in the eighteenth century, is a figure who has more affinities with Fielding's Jonathan Wild than the characters of *Oliver Twist*.

His first major success came with *The Book of Snobs* (1846-7), a collection of portraits originally published in the magazine *Punch*, which casts a critical eye on Victorian class-consciousness.

Vanity Fair and *Henry Esmond*

Vanity Fair, one of the masterpieces of nineteenth-century "realism", offers a satirical critique of upper middle-class society at the beginning of the nineteenth century. Sub-titled a "novel without a hero", its declared purpose is "to indicate, in cheerful terms, that we are for the most part an abominably foolish and selfish people 'desperately wicked' and all eager after vanities". The machinations of its most memorable character, the scheming Becky Sharp, as she makes her way up the social ladder, attract the sympathy of many readers, in much the same way as Defoe's Moll Flanders' predicament has been seen to vindicate *her* behaviour.

Thackeray admired *The English Humorists of the Eighteenth Century* (the title of a lectures series he published in 1853) and like *Barry Lyndon*, his novel *Henry Esmond* (1852) and its sequel *The Virginians* (1857) were set in this century. *Henry Esmond*, his finest achievement after *Vanity Fair*, deserts the romantic heroism characteristic of much historical fiction in favour of psychological complexity and an ambiguous representation of social forces. At the end of the novel, Henry moves to Virginia and *The Virginians*, which includes scenes set against the backdrop of the American War of Independence, follows the fortunes of later generations of his family.

Other Novels

Thackeray's other novels include *Catherine* (1839–40), the semi-autobiographical *Pendennis* (1850) and *The Newcomes* (1853-5). His fiction frequently employs direct addresses to his readers, *e.g.* "If Miss Rebecca Sharp had determined in her heart upon making the conquest of this big beau, I don't think, ladies, we have any right to blame her". This intrusiveness has seemed dated to some modern readers, but admiration for his comic realism and his satirical exposure of Victorian hypocrisy have helped to re-establish Thackeray's reputation as a major novelist in recent years.

The Brontës

Although *Jane Eyre* (1847) and *Wuthering Heights* (1847) are universally accepted as classics of English fiction, in their own day they were controversial works that challenged the conventions of early Victorian fiction and the social values of the era, particularly with regard to their representation of male-female relationships. Their respective authors, Charlotte (1816-55) and Emily (1818–48) Brontë published their work under names that concealed their gender identity, Currer and Ellis Bell, while their sister Anne (1820–49) wrote under the name of Acton Bell.

Early Life

The sisters grew up in a parsonage in the then-remote village of Haworth on the edge of the Yorkshire moors. As children, they invented their own private fictional worlds, which particularly in the case of Emily seem to prefigure the alternative worlds of their adult writing. They were strongly influenced by the Romantics (particularly Byron) and their novels introduced a new Romantic dimension into prose fiction, particularly in their emphasis on the interconnectedness of external nature and human character and their use of patterns of unifying organic imagery.

The central situation of Charlotte's masterpiece *Jane Eyre* is a sophisticated version of the plot of Richardson's *Pamela*: Jane is a governess, who finds herself torn between the conflicting claims of passion and restraint, when her employer Rochester, whose "mad" wife, Bertha, is immured in the attic of his house, tries to persuade her into an extramarital liaison. Circumstances finally allow Jane, who takes the view that "Women are supposed to be very calm generally: but women feel just as men feel", to reconcile the forces that threaten to tear her apart and marry Rochester on equal terms, having inherited money of her own. She becomes her "own mistress" and escapes from the position of social inferiority that characterizes the situation of many earlier heroines of English novels.

Wuthering Heights

No such resolution is possible in the story of the love of Cathy and Heathcliff, which dominates Emily Brontë's only published novel, *Wuthering Heights*. Its plot dramatizes a disparity in social background and world-views that drives the lovers apart and the novel reaches a tragic conclusion midway when Cathy dies. Nevertheless the commitment to passion is more total than in *Jane Eyre*: love transcends the grave when, after her death, Cathy's ghost haunts Heathcliff. At the same time, *Wuthering Heights* encompasses several other stories, centred on relationships between the contrasted Linton and Earnshaw families across two generations and reconciliations are achieved at the end. The novel's narrative technique is one of the most complex to be found in English fiction prior to the work of Joseph Conrad and Henry James. Its intricately plotted time-scheme and its two narrators, the outsider Lockwood and the old family servant Nelly Dean, lend credence to what might otherwise seem a far-fetched sequence of events. Charlotte's other novels were *Shirley* (1849), *Villette* (1853) and *The Professor* (1857).

Anne Brontë

Anne Brontë is remembered as the author of *Agnes Grey* (1847), which like *Jane Eyre* deals with the life of a governess, and the darker, more complex *Tenant of Wildfell Hall* (1848). The latter's account of a woman's suffering at the hands of a drunken husband seems remarkably modern, but on its first appearance represented another aspect of the Brontës' fiction that challenged contemporary expectations. Prior to the success of their novels, the three sisters had published *Poems by Currer, Ellis, and Acton Bell* (1846). Emily, who wrote a number of powerful short lyrics on death, is generally considered the finest poet of the three.

Anthony Trollope (1815–82)

Trollope is best remembered for his Barsetshire and Palliser series of novels, but together they constitute less than a quarter of his prolific fictional output. He first became famous with his fourth novel, *The Warden* (1855), which inaugurated the sequence set in the fictional West Country county of Barsetshire. It was followed by *Barchester Towers* (1857), a perceptive study of the impact of social changes on the community, which further augmented Trollope's reputation with the reading public. The other volumes in the series, which benefit from being read as part of the evolving sequence, are *Doctor Thorne* (1858), *Framley Parsonage* (1860-1), *The Small House at Allington* (1862–4) and *The Last Chronicle of Barsetshire* (1866-7). The Barsetshire novels offer a microcosm of English rural society in transition in the mid-Victorian period with a particular insight into ecclesiastical politics. Their particular strength lies in their realistic rendition of "ordinary" events.

Trollope's later fiction, including his Palliser novels, is more concerned with urban society and parliamentary political life. The Palliser novels are *Can You Forgive Her?* (1864–5), *Phineas Finn: The Irish Member* (1867–8), *The Eustace Diamonds* (1871-3), *Phineas Redux* (1873–4), *The Prime Minister* (1875–6) and *The Duke's Children*

(1879–80). Other later novels include *The Claverings* (1866–7), *He Knew He Was Right* (1868–9), *The American Senator* (1876-7) and *Dr Wortle's School* (1880). His longest novel, *The Way We Live Now* (1874-5), a satire on speculative commercialism, is now sometimes regarded as his finest work. Its depiction of stock exchange gambling has given it a particular relevance for contemporary society.

Trollope travelled widely, recording his impressions of other societies in such works as *The West Indies and the Spanish Main* (1859) and *Australia and New Zealand* (1873–4). For most of his life he worked for the post office and, literature apart, has a claim to fame as the man responsible for the installation of the first post box: on Guernsey in 1852.

The Condition of England Novel

Towards the middle of the nineteenth century a sense of the widening gaps between different segments of English society was expressed in a group of novels primarily concerned with what later became known as "the Condition of England". Such novels included Benjamin Disraeli's *Coningsby* (1844) and *Sybil* (1845), Elizabeth Gaskell's *Mary Barton* (1848) and *North and South* (1855), Charles Kingsley's *Alton Locke* (1850) and Dickens's *Hard Times*. Partly inspired by Carlyle's warning that the class divisions created by the Industrial Revolution were a recipe for revolution, Condition of England novels drew attention to disparities between the industrialized north and the more affluent south, the human consequences of mechanization, the need for a more egalitarian educational system and abuses of power occasioned by the new manufacturing industries.

George Eliot (1819–80)

George Eliot (the pen name of Mary Ann Evans) grew up in the English Midlands and her early fiction deals with the lives and loves of ordinary people from the region. It includes the three stories that make up *Scenes of Clerical Life* (1858) and the novels, *Adam Bede* (1859), *The Mill on the Floss* (1860) and *Silas Marner* (1861). *Adam Bede* tells the tragic story of Hetty Sorrel, who murders her illegitimate child. *The Mill on the Floss* is a more autobiographical work, in which the imaginative heroine Maggie Tulliver struggles to find love and self-fulfilment. The shorter *Silas Marner* is a moral fable about a miserly weaver, who is brought back into the human fold by the advent of a small child into his solitary life.

George Eliot's Masterpiece

If Eliot's career had ended here, she would be remembered as a fine regional novelist, with a talent for exploring the intricacies of human motivation, but her subsequent fiction is more ambitious in scope and more penetrating in its analysis of social issues. After broadening her fictional horizons with *Romola* (1862–3), a historical novel set in Renaissance Florence, she subsequently published three novels that were markedly more complex than her early work. *Felix Holt: The Radical* (1866), in which she attempts to emulate the form of a Greek tragic trilogy, is about rural electioneering at the time of the First Reform Bill (1832), a defining moment in British social history. Her masterpiece, *Middlemarch* (1871–2), a novel of epic proportions, is set in the same period. It interweaves four complex stories, to provide an intellectually probing study of "provincial life" during a time of rapid change. Its more memorable characters include Dorothea Brooke, a later more developed version of Maggie Tulliver, her academically sterile husband Casaubon, who is trying to write a "key to all mythologies" and the progressive young doctor, Tertius Lydgate, whose passion for medicine parallels Dorothea's for scholarship. However, its overall effect depends less upon the success of its individual characters than its skill in demonstrating their interaction in the novel's social microcosm.
